VOLVME CXXVI

JANIJVNE 1924

THE BVILDER

AN : ILLUSTRATED : WEEKLY JOURNAL : FOR : THE : ARCHITECT : AND : CONSTRUCTOR.

"EVERY man's proper mansion-house, and home, being the theater of his hospitality, the seate of selfe-fruition, the comfortablest part of his own life, the noblest of his sonne's inheritance, a kind of private princedome, nay, to the possessors thereof, an epitome of the whole world, may well deserve, by these attributes, according to the degree of the master, to be decently and delightfully adorned." - - - - - - - -

"Architecture can want no commendation, where there are noble men, or noble mindes."

—SIR HENRY WOTTON.

"OUR English word TO BUILD is the Anglo-Saxon Bȳlban, to confirm, to establish, to make firm and sure and fast, to consolidate, to strengthen; and is applicable to all other things as well as to dwelling-places."—DIVERSIONS OF PURLEY. - - - - - -

"ALWAYS be ready to speak your mind, and a base man will avoid you."—WILLIAM BLAKE. - -

THE BUILDER

A JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR.

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

VOL. CXXVI.—No. 4222. JANUARY 4, 1924.

NEW YEAR THOUGHTS.

ON the threshold of a new year our thoughts naturally turn to Anticipation and Retrospection—hopes and fears for the future; happiness or regret for the past. Nearly a century has passed since the first issue of *The Builder* — a wonderful period in retrospection of the world's history, but so important and far-reaching have been recent events in our national life that it would be difficult to place a limit on our speculations for the future.

All who are actively interested in building must feel that we are living in a comparatively new era, both as to the kind of buildings required and the methods of constructing them. One great and beneficent change which has come about in the more civilised countries is the increased consideration for the life and well-being of the individual. The craftsmen connected with building work have a vastly better time than they formerly had, and we are now all agreed that men can no longer be treated as they were, and that they should be paid an adequate wage, under tolerable conditions of life. Out of this improved condition there have sprung up numerous buildings for the amelioration of the lives of the poorer people, opening up many new fields in the architect's and surveyor's design and the builder's work. The cathedral and church are still being called for, but in small proportion to the cinema, the theatre, the restaurant, the playing fields, the baths, the schools, the garage, the big stores, the concert halls, and the housing settlements. Besides this, the educational developments, both of primary and secondary character, of universities and schools of many kinds are going forward at an increasing rate. Again, in the development of better governing methods we are getting a greatly increased number, and of a better character, of buildings for municipal and county work. The increasing variety of building work opens up an ever-widening vista of needful study and thought. The wonderful development of electricity, of gas, of air travel, and improved means of transport generally are leading us far beyond the old beaten tracks of life. We are possibly on the verge of many extraordinary developments, and amongst all the complexity of modern wants we have springing up an ever-increasing number of trained specialists. To direct and use all that is required in modern building construction the architect and builder have a complicated and difficult task.

We imagine few people realise the costly and elaborate establishment required to keep in full activity the affairs of a big building contractor, and how his secretary, accountant, buyer, financier, numerous foremen, and hundreds of workmen have to be co-ordinated into a smoothly efficient whole. If the architect even approaches anywhere within hailing distance of what are supposed to be his ideal qualifications, he will have to rise far above the standard of the average man. We have not, however, written the above as a suggestion that the tasks before us are impossible, but rather to emphasise the need for co-ordination of effort and a broadening of our outlook and sympathies.

For a moment we should, perhaps, do well to extend our thoughts beyond our account-books, beyond our individual affairs, and beyond the petty limits of our own experience, and endeavour to realise how far our work and our views of life are of benefit to others. So far as architectural art is concerned, is it not well that we try to put more soul into it so that we may enable humanity to glean some pleasurable feeling from what we do? Some sense of nobility and dignity in our public buildings—some suggestion of use and service in our commercial structures—a hint of security and trust in our banks—a feeling of animation and joy in our pleasure-houses—some thoughts of lofty ideals in our churches—some sweet and peaceful charm in our homes: all these varied qualities may go with good proportion, nice refinements and common-sense building. How far do we in any of our buildings succeed in this way?

The capacity of British builders at their best is surely of the best the world can show, but is our architectural design worthy of it? Those who have spent a great part of their lives in trying to get together as much money as possible are not likely to benefit greatly either themselves or others. But those who live for their art should find a great recompense. It has been said so often that a pleasurable occupation brings its own reward that the very triteness of the saying obscures its significance. Yet it would revolutionise the world if all could find it. Is it possible that a great part of the failure in modern building is the lack of pleasure in our work and thus the failure to impart pleasure to others? We have perhaps thought more of showing our cleverness, our knowledge of style, our subservience to passing fashion, than of supplying something that may respond to human feelings. Our buildings will be dull and lifeless unless we can put some human appeal into them and unless they are the expression of some spiritual feeling. Spirit answers to spirit, and no true and sincere feeling will fail to evoke a response. We hope that some realisation of this will find its way into the minds and ambitions of our students. To them greater opportunities are likely to come than have ever been offered before, and if we let the dead past bury its dead we may really act more successfully in the present and so lay the foundations for a better and better future.

We doubt whether we keep a sufficiently open mind about art as well as about men and affairs of a general kind. Just as art is not to be bound and fettered by labels and dogmas, so also the domestic politics of the architectural profession should be conducted in a broad and generous spirit which welcomes good counsel from any quarter. It is impossible to ignore moralities and ethics in the conduct of a great profession, and we should welcome a spirit of greater tolerance and wider understanding in regard to it. A well-known architect expressed his opinion the other day which practically implied that the present fashion in architectural methods was fundamentally wrong, and we hardly like to admit how far we share his belief: it should be impossible to withhold our regard for his criticism. Can the profession be said to contain a high average of attainment? In any case there is no need to be wholly condemnatory or entirely hopeless.

Of one thing we feel sure: unless the practice of architecture is conducted with a sincere attempt to live for art as well as by it, we shall fail to earn the regard and encouragement which we all so desire. In wishing our readers a happy New Year we pledge *The Builder* to support every good effort to build beautifully and well.

NOTES.

The New Year.

EVERY new year brings with it something of new promise—of restored hope. Its pages are as yet a blank; what is to be written not yet inscribed upon them. The deeds of which it will speak are not as yet matured, but it is for us to shape them, and at such a time doubts should not betray us. To give form to beliefs, fulfilment to promise, to shape deeds out of our thoughts and to think fearlessly—this is to build stronger than with bricks and mortar, for on it the future of us all rests. There are many anxious problems; change is weaving itself amidst aims but half understood, such as the relation of art to industry, that the claims of each may be sustained; the growing realisation of the importance of art to life, if civilisation is to be secured; the higher values for architecture; these, which machinery and what is outside of us cannot do, we see to rest more on individual responsibility and an enlarged sense of citizenship. It is towards this higher conception that life is moving and through which the ideals of democracy will achieve themselves. For it is not in the fixed and already established only that life can rest, and the past may become a burden to us; it rests also on the unknown, which will project itself in the likeness of our acts and on which life no less than architecture and the arts altogether depend. It is on this better self-knowledge that we can best rely. Let us therefore "without haste and without rest," go forward to the problems which the New Year has in store for us.

Hoardings.

IT is announced that Shell-Mex, Ltd., and the Anglo-American Oil Co., having been impressed by the public dislike of blatant hoardings, have decided not only to erect no more, but to remove the signs to which objection is taken. We cannot sufficiently congratulate these firms, and we are confident that, far from losing by such a decision, they will gain immensely in commercial prestige. In this connection we owe a debt of gratitude to the Society for the Checking of Abuses in Public Advertising, for the success of its efforts. There can be little doubt that this movement will continue with increasing impetus, and it is a magnificent symptom of the growing public regard for natural and architectural amenities. Certain directional and other signs of public importance are to be retained by the two companies mentioned, and the incorporation of these into designs of æsthetic value should give the greatest interest and scope to the companies concerned as well as enjoyment to the public.

Railway Advertisements.

THE same feeling is indicated in the action of the London, Midland and Scottish Railway Company, who are commissioning certain Royal Academicians to design posters illustrating places of interest on the line. Not only is this valuable as a movement away from definitely meretricious work, but it promotes a study of positive importance in a new direction. Railway advertisements, more than any others, require the peculiar genius of the poster art, and we are glad to use the word art advisedly. They must be legible and effective not only from a distance but when viewed moving at a distance, and they, therefore, epitomise the difficulties and triumphs of the poster. After all, the movement towards enlisting the aid of the recognised artist began with the enterprising firms who first bought popular pictures to incorporate oleographically in magazine pages; but the present departure is not a mere copyright perquisite of work already executed, it goes farther, and is of far greater artistic significance, and may help to revolutionise the appearance of the countryside. Every great war produces a wave of popular indignation against conditions that appeared inevitable to the preceding generation; and the substitution of beauty for ugliness, and the general tidying up of our cities and countryside should be one of the most important of the many reforms that we are on the eve of witnessing.

The Abolition of Field Signs.

THE announcement of the intention of these companies is altogether welcome news, and an augury of much promise for the future. That their action will lead to this form of advertisement being generally abandoned may be expected, and a new era will be opened in the relation of trade interests to the country's welfare. There was no mistaking the feeling of the public or the press, to whom these signs had become a great offence, not only injurious to the country-side, but to everyone concerned for the decencies of advertisement. We learn also that a "third company, the British Petroleum, has already agreed to withdraw theirs from Cornwall, Kent, and the Lake District." The Automobile Club and the Scapa Society (which has done such good work in this direction) have been very active in their efforts to reduce the number of advertisements and prevent the disfigurement they include, and though we must expect to see the continuance of advertisements at garages and other places where petrol is sold, we may trust the same public spirit, which is leading to the abolition of field signs, to improve their character, for which there is great need. For sheer Philistinism it would be difficult to surpass these petrol signs, and we hope that we shall soon see better. It will be remembered that a Government Department some months ago took action in the matter of rural disfigurement—the Ministry of Transport sending a circular to all local authorities reminding them of the powers they possess under the Advertisement Regulation Act, and to which we alluded at the time.

Bench-Ends at St. Nicholas, Walcot, Lincs.

Urban Districts and Advertisements:

URBAN districts, the vast areas of our principal cities, are not yet brought in any adequate way within the scope of this growing reform in advertising. It is not enough to cleanse the country-side of their disfigurements. Public opinion would, we believe, welcome further action towards the restoration of the amenities of our streets and public places, in which an advertising pandemonium now reigns. No doubt there are special difficulties to be faced in any such action from the vested interests which have been developed and the profits accruing. The letting of the walls of houses and vacant spaces to advertising companies offers an inducement which will not be easily given up. But the public advantage comes before private interests, and we are all concerned to see our streets tidied up and made more becoming to the tide of life constantly passing through them. The restraint of advertisement, where it infringes the public right, is one necessary not only to the self-respect of the community, but to the pleasure of life.

The Disfigurement of Buildings.

WE have often commented on the way in which the sky outlines of buildings and their accessories are permitted to offend the eye. A correspondent

Bench-Ends at St. Nicholas, Walcot, Lincs.

pertinently comments on the excrescences which have been allowed to disfigure the fine building of the Institute of Chartered Accountants, illustrated by a photograph. We question whether the excuse that "what is everybody's business is nobody's business" can be made to serve. If our city is endowed with governing authorities should they not be furnished with sufficient authority to prevent the spoliation of fine buildings and to prevent the destruction of city amenities which affect us all? It is no good vaunting the progress of civilisation whilst these sort of things exist. What about the terrible eyesore in front of the great Bush building, the horrible jumble round the noblest equestrian monument we possess, the nightmare of Piccadilly-circus, or the alteration of one of our finest streets into a lane? A hundred other offences against city amenity could be easily recited, and the only remedy lies with an enlightened and determined governing body. Will that ever arrive?

A Sectional Solution of Unemployment.

WE would urge all those who own buildings, or who have the control of buildings, to consider the sound economic sense of getting to work now with the needful painting of buildings whilst many painters may be idle, instead of waiting until the Spring, when the demands on workmen are so much greater. The advice tendered by the National Painters' and Decorators' Joint Council is clearly and sensibly expressed as follows:—"The individual householder who places work at the present time will get the pick of the skilled men; his work will get much closer attention from the employer than is possible during the rush season, and it is surely obvious that estimates given at a time when the chief concern of the employers is to keep their staffs together must compare favourably with those given when the main preoccupation is to meet the requirements of a seasonal rush. From the public point of view, is it not the most futile form of economy to have capable men walking the streets supported by public funds, while public property is deteriorating in value for want of the particular kind of service they are able to give? Public bodies, surely, will need only a hint to see that the placing of painting contracts now will not only relieve the distress of a very worthy body of citizens, but prove also a sound business proposition." The above may be regarded mainly, if one prefers, as a sound piece of advice to individual members of the community to obtain the best and most economical service for the painting and decorative work they require.

The Plaistow Floor Collapse.

FROM the evidence given at the inquest on the two men who were unfortunately killed just before Christmas by the collapse of a reinforced concrete floor at Plaistow, it is clear that the accident should not have happened. Apparently the most elementary principles of concrete construction were neglected; it appears that a mixture of cement and clinker in the proportion of about one to seven was used, a mixture totally unsuitable for the purpose; that the reinforcing rods were not tied; that the shuttering was removed before the concrete had properly set; and that after it had fallen the concrete was found to be still in a sodden state. Reinforced concrete is, perhaps, still a new material to many builders, but, providing proper attention be given to a few simple rules, reinforced concrete should not present any great difficulties from the point of view of the builder. Design, of course, is another matter, but had an architect or engineer been consulted on this work (which apparently was not the case) it is practically certain that the accident would not have taken place.

Concreting in Cold Weather.

No doubt the cold weather had something to do with the Plaistow accident, and it may not be out of place here to emphasise the necessity of protecting newly-laid concrete from frost. At this time of the year it often happens that there is a sharp frost in the morning, of which there is no indication over-night, and it is therefore advisable to cover with tarpaulins or other available material all freshly-laid concrete before it is left for a night. Concrete may be laid with safety during the sharpest frost providing adequate measures be taken to heat the aggregate and mixing water and to keep the finished work covered until it has finally set.

Sir Walter Lawrence.

THE mention in the New Year list of birthday honours of the name of a distinguished architect or contractor is such an infrequent occurrence—though we do not know why—that we read with much satisfaction of the distinction of Knighthood which has been conferred upon Mr. Walter Lawrence, the well-known head of the firm of Messrs. Walter Lawrence & Son, Ltd., whose standing may be judged by the work they are carrying out at the present time. Sir Walter Lawrence, who has been connected with the building industry since he joined his father's business, and who has been Governing Director of the firm from the time it was converted into a company, has already received most of the honours which those in the industry have it in their power to confer, having served as President of the following bodies, *i.e.*, the Institute of Builders, the London Master Builders' Association, and the Builders' Benevolent Institution, and the interest he has taken in the well-being of the trade was shown in the unusually interesting attempt he made in 1919 to introduce a profit-sharing scheme and it was certainly not his fault that the generous proposals he made did not materialise. We are not surprised that he is still of opinion that his scheme would do much to prevent trouble in the industry. For some years he has taken an interest in the London Museum, the usefulness of which he believes can be extended for educational purposes, while his practical and generous sympathy has been shown on behalf of many deserving causes. In congratulating Sir Walter Lawrence we believe we are expressing the views of the industry as a whole when we say that the honour which has been conferred upon him is well merited and that no worthier recipient could have been found.

Bench-Ends at Walcot, Lincs.

GENERAL NEWS.

"THE BUILDER" NEW YEAR NUMBER.

The Special New Year Number of "The Builder" will be published next week, January 11.

Professional Announcements.

Mr. A. Wheatley, architectural assistant to the Engineer-in-Chief of the Midland (now the London Midland and Scottish) Railway Company since 1905, when he succeeded as architect the late Mr. C. Trubshaw, has retired after 48 years' service with that company.

By the death of his father, Mr. J. Douglass Mathews, in April last year, after 67 years' service in the profession, Mr. H. Edmund Mathews, F.R.I.B.A., is the sole surviving partner in the firm of J. Douglass Mathews & Son. Mr. Mathews is therefore taking into partnership Messrs. Geoffrey and Basil Ridley, AA.R.I.B.A. Mr. Geoffrey Ridley has been a partner with Mr. H. Edmund Mathews in his practice at East Grinstead since 1912, and Mr. Basil Ridley has been associated with the London practice since the war. The firm, which is now known as J. Douglass Mathews, Son & Ridley, has taken new offices at 3, Paul's Bakehouse-court, St. Paul's Churchyard, E.C.4.

Roman Remains in the City.

At a lecture recently given by Mr. Herbert A. Cox, F.C.A., at the Bishopsgate Institute, photographs were shown of the foundations of the old Roman wall.

The following articles, found during excavations for a new building for Messrs. Henry Marks & Sons, and lent by Lt.-Col. J. S. Marks, were also shown:—Roman tiles used in building the old London wall; Roman brick; boundary plate of All Hallows-in-the-Wall, dated 1776. Other interesting articles found, but not exhibited, included numerous coins and tokens. Roman coins: Valentinian (A.D. 364-375); Roman Tetricus, Senr. (A.D. 274); Charles II (1674-1670); Elizabethan sixpence (1582). Tokens: Halfpenny and a farthing (dated 1660); sundry portions of pottery and stoneware. The above, with the exception of bricks and tiles, were found in the bed of the Houndsditch, mostly at a considerable depth. The City side is not yet excavated. Messrs. Lewis Soloman & Sons are the architects of the new building, and Messrs. H. & H. F. Higgs, of Herne-hill, S.E., the contractors.

R.I.B.A.

The competitions for the Alfred Bossom travelling studentship will be confined to those students of the recognised schools of architecture which enjoy exemption from the R.I.B.A. final examination, who, after passing through the school courses, have attained the Associateship of the R.I.B.A. A minimum attendance of one session full time work at a recognised school shall be taken to constitute membership of that school.—The R.I.B.A. has issued a statement to the recognised schools of architecture in connection with the competition for the Archibald Dawnay Scholarships.

The following members have been appointed to represent the R.I.B.A. on the proposed conference on the shortage of skilled labour in the building trades:—The President, the Hon. Secretary, Major Harry Barnes, Mr. Percy Thomas, Mr. T. R. Milburn, Mr. Herbert A. Welch, Mr. G. Hastwell Grayson.

ACADEMIC DRESS COMMITTEE.—The report of this Committee (appointed in May, 1923), will be submitted to the General Body at the Business Meeting on January 7, 1924. The Council recommend that the proposal be dropped.

FILTER ILLUMINATION.

WE are probably all agreed that the effect of colour upon human beings is definite, but few realise how far-reaching and subtle it is. At all events, there are now in American hospitals installations of filter illumination which it is claimed have a very markedly good effect on the patients. We have visited the studio of Miss Irwin, at 68, Redcliffe Gardens, and seen some very interesting displays of the filter illuminations which she has made a study of for some years, and were able to realise the charm of the lighting effects she produces. It appears to us that her work in producing a fine diffusion of light with added values to health and economy is especially worth the careful attention of architects and engineers who have to act as guides and referees to the general public. That the interposition of these finely graded colour shades between us and the light has an unquestionable value we may be sure, but that it even goes so far as to be an aid to respiration is a matter for doctors to decide. Many of our readers would, we think, be interested in seeing what this lady's long study of the science of illumination has brought about.

COMPETITION NEWS

Taunton.

Mr. Robert Atkinson, F.R.I.B.A., the assessor, with Mr. Howard Robertson (nominated second assessor by Mr. Atkinson), have now made their award in the Taunton War Memorial competition as follows:—

First Premium (£100).—Mr. E. Vincent Harris, 29, St. James's-square, S.W.1. (This design is given this week.)

Second Premium (£50).—Mr. A. C. Pickford, 33, Calbourne-road, S.W.12.

The designs submitted by the following competitors were commended:—

Messrs. William & T. R. Milburn, Sunderland.

Messrs. R. S. Dixon & N. D. Quick, Letchworth.

Messrs. Gordon H. G. Holt and Verner O. Rees, W.C.1 (for two sets of drawings).

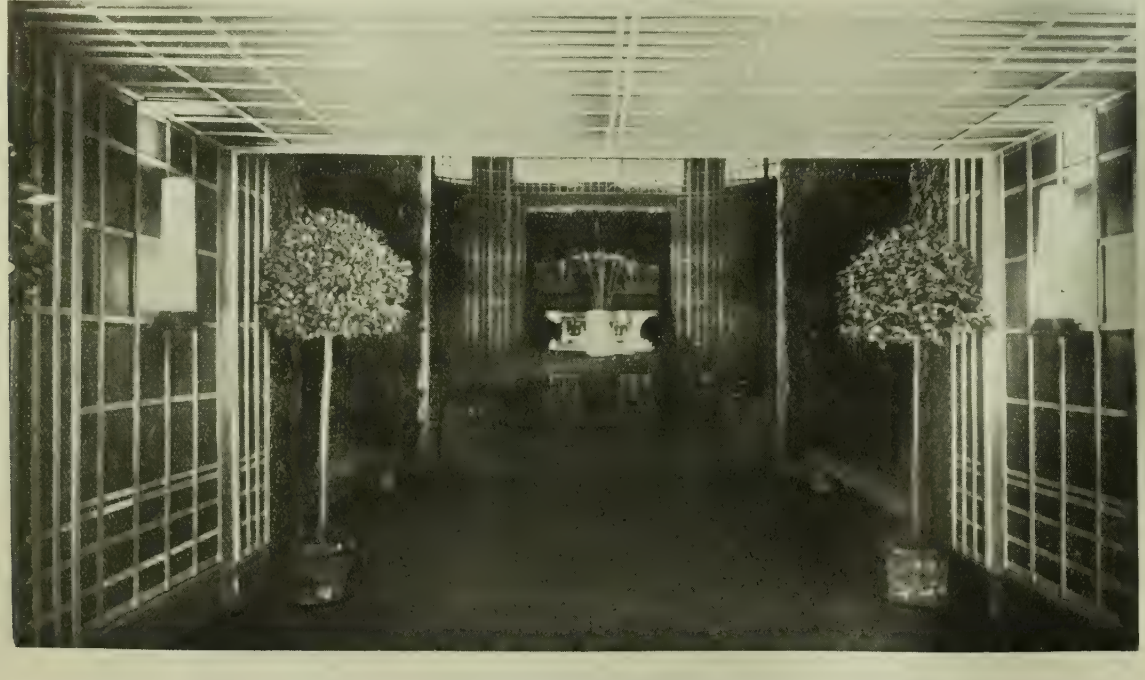
Messrs. Cooke & Harrison, W.C.1.

Messrs. Willink & Dod, Liverpool.

Talbot Memorial Park.

Design for a Lodge and Main Entrance Gates. A premium of 20 guineas is offered, and the successful architect will be engaged to supervise and carry out the work. Sending-in day, January 20.—*Banned by R.I.B.A.*

Palais de Justice, Cairo.



The American Institute of Architects has cabled to Cairo protesting against the conditions of this competition.

Manchester.

The announcement with regard to the appointment of Dr. Percy Worthington as assessor in the Manchester Grammar School Competition was made prematurely. No decision has yet been made in the matter.

Other Competitions.

Other competitions still open include the following (the dates given are, first the sending-in date, and second the issue of *The Builder* in which full particulars were given):—Dudley Memorial (Jan. 5; Sept. 14, 1923). Newcastle Concert Hall (Feb. 1; October 26, 1923). Essays on Heating and Ventilating (Mar. 31; Nov. 9, 1923). Holmside Hospital (Feb. 14; Dec. 14, 1923). Industrial Designs (June; Dec. 21, 1923). National Theatre (April 26). Monument to Sir Wilfrid Laurier (April 3; Dec. 14, 1923). Belfast Union Lighting (March; Nov. 9, 1923). Dunfermline War Memorial (March 8; Dec. 28, 1923).

An Example of Colour Filter Illumination in a Paris Cafe.

CORRESPONDENCE.

The Villa Carlotta.

SIR,—I hear from a friend in Genoa that the Villa Carlotta (referred to in your issue of December 28, 1923, p. 987) will not be dismantled and that national protests have been successful.

T. E. ECCLES.

Liverpool.

[We are glad to know this.—ED.]

The Disfigurement of London Buildings.

SIR,—It is an extraordinary thing that, although this is the age when every civilised community should recognise æsthetic surroundings to be one of the greatest factors in determining the welfare of the people, our Metropolis permits the wholesale disfigurement of every skyline and vista by the erection of the most atrocious monstrosities in sky-signs the world has ever seen, in the shape of hunchbacked chimneypots made of galvanised iron.

Without being an architect it ought to be clear to every educated and observant citizen that the pleasing effect of every building must be at once destroyed by the erection of such a ghastly malformation on its roof as that illustrated in the enclosed photograph.

Your readers will at once see by the illustration that the building disfigured by one of the ubiquitous monstrosities mentioned above is of an elaborate and costly type, and should have been kept a thing of beauty and joy for the citizens at large, as well as for the members of the particular society who must have paid for its construction.

Clearly there is something lacking, not so much among the masses of the people, but among those to whom the masses should look for a better example, when members of a learned society can erect a splendid building with a cupola, and see without protest the cupola made secondary to a deformed chimneypot, and I am wondering whether any of your readers could furnish a word which would describe the spirit of the professional man who can tolerate the creation of such an eyesore as that illustrated, which at once renders his expensive official quarters both squalid and ignominious.

G. O. PARSONS.

Strand-on-the-Green.

SIR,—Strand-on-the-Green at the moment is evoking considerable attention, and probably some visits, as a result of the publicity recently given to this old-world strip of riverside. This time of year is not calculated to show it at its best; it should be visited on a sunny day, preferably at high tide, when the river front is all a-sparkle with reflected light. At low tide, on a sunless day, it is very disappointing. Yet within this half-mile of river front there are quite a dozen pleasing pictures, which, in the course of several years I have transferred to lantern slides. The protests against the ugly and unnecessary wall are a welcome sign that the local residents have a sense of beauty and a pride in their surroundings. What did it matter if an exceptionally high tide covered the footway, are there not little raised dams on the thresholds to prevent flooding of the sunken floors, and was not the walk a little more eventful for the spice of adventure which it gave?

T. D. WALKER.

Brickwork in North America.

SIR,—In a recent issue of *The Builder* I read it is stated by the Minister of Labour that there are in Great Britain 5,000 carpenters, 15,000 painters, and 35,000 labourers unemployed, the chief reason being the scarcity of bricklayers. If this is so, and the demand for houses is so acute that people are living in converted workhouses, disused prisons, and even caves, why not cut out some of this slow and expensive brickwork and adopt the semi-solid brick houses that are built in hundreds of thousands every year in all cities of North America, and so enable these scarce bricklayers to turn out more houses in a given time, thereby allowing more of these carpenters to be employed and so relieve the housing scarcity.

Degradation of Building Outlines. The Chartered Accountants' Institute.

On this continent many houses are solid brick to first floor joists, then the upper story is frame construction, 2 by 4 studs, 16 in. centres, covered on outside with 1 in. sq. edge or T. and G. sheeting, and either shingled with B.C. cedar shingles or the asphalte and crushed coloured slate surface ones, or eels strapped with 1 by 2 strapping, lathed and rough-casted and finished with the 1 in. counterfeit half-timber work familiar to old country housebuilders. The studding on inside is lathed and plastered in the usual way. The houses built by this method are not all of the pokey kind that must be of solid brick to the eaves and peaks of gables, that are going up so slow and painfully for the working classes of England, but the method is applicable to houses of all sizes, and they are finished with hardwood floors, hardwood trim, central heating, and wired for electric stoves, and with other conveniences seldom or ever found in English houses, and they withstand a far more extreme climate. Of course, I know the first objection that would be raised by Old Country people would be "Fire," but this is simply prejudice. I see that London has now adopted the steam shovel, the gasolene concrete mixer, the underground gasolene tank and pump, and now the pneumatic drill and chisel in place of the steel wedge and the picturesque squad of navvies armed with sledge-hammers. All of these have been common here for years; so I hope in time it will be discovered that there are methods of building comfortable and permanent houses other than all brick, and I think that those who are in authority and have to do with this unemployment and housing shortage would do well to realise it.

A. C. SHAYLER.

Ontario, Canada.

Can Tarnishing be Prevented?

SIR,—Your correspondent appears to be troubled with excessive tarnishing, not with such discoloration as always occurs in every house.

I would suggest that heating by gas radiators be discontinued. Also that instead of there being *no flues*, ducts or flues be made for ventilation.

G. J. ABELL.

SIR,—If silver is to be kept bright it must be stored in a dark place, for light will blacken it, particularly if sulphur or ammonia fumes come in contact with it.

The whole photographic process is based upon this property of silver, and in the old days of horse-drawn traffic the silversmiths of London had very considerable difficulty in keeping their wares bright, because of the fumes given off by the excreta of the numerous horses. A transparent lacquer is the only thing which will abolish the labour of frequent cleaning.

T. D. WALKER.

SIR,—The trouble in this case is, in all probability, due to the acid fumes arising from the use of the gas radiators. I should seriously consider the question of scrapping these and installing a simple system of hot-water heating, with the furnace entirely divided from the building, so that no coal, coke, or other fumes or gases arising therefrom, penetrate into the building from the furnace or stokehole.

I have seen the effects of tarnish, and have also seen sheet brass made absolutely rotten, caused by the acids from coal-gas fumes.

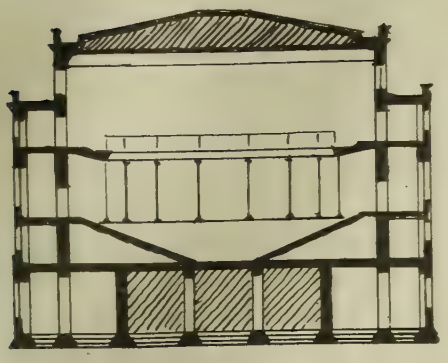
THE TRIANGULAR ELECTION, 1923.



THE PROBLEM OF SEATING THREE PARTIES.

WHEN Sir Charles Barry laid down the present contrivance of seats, above and below the gangway, in the House of Commons, no prospective provision was thought of by which an unprecedented result, like that brought about by the recent election, could be efficiently accommodated. Up to the present day "the two party system," upon which the unwritten code of the British Constitution is based, has successfully held its own. Such an allocation of the benches of the Second Chamber has sufficed for working the Parliamentary machine. The Irish Home Rulers sat with the Opposition, and the capable but small "Fourth Party" scarcely interfered in the matter of seating. The present number of Representatives in the House is 615. Previously the normal number was 707 or thereabouts. When the Irish left Westminster about 90 seats became vacant, but several redistributions of the larger old constituencies increased the number of English and Scottish members. Anyhow, for the time being sufficient space is furnished for all the Commons likely to be present in Parliament for a good while to come. The difficulty now arising has been brought about by the partisan attitude of the triumvirate of approximately the same numerical strength, each in turn pledged as a party to act independently of the others, although technically one section on the Opposition side may claim to have an official prerogative in addressing the Speaker. Such a condition of affairs perhaps will prove transitory, though certainly abnormal in this country. In the English Parliament the momentous step of "crossing the floor of the House" has enormously assisted in consolidating the historic differences between H.M. Government and H.M. Opposition in the conduct of business. Hence, also, in the main, comes an adherence to the elongated form of the British House of Commons Chamber. Abroad, where members speak from a tribune, the usual shape of the auditorium for the Legislative Assembly, such, for example, as the House of Representatives at Washington, is segmental. The Chamber of Deputies at Paris, also referred to with its semicircular form, accommodates the Governmental party or "Moderates" in the centre, with sections tapering off right and left to their opposite extremes, and allocated by slightly differing classes politically, engaged in bargaining as best they may to accommodate their differing ultimatums. All this is quite different from our Parliamentary habits in this country, where it is reckoned broader principles prevail.

The accompanying plans illustrate this subject, particularly in regard to building essentials, and our illustrations furnish in a graphic manner the historic synthesis of what happened nearly a hundred years since at Westminster prior to the famous fire of 1834, which reduced the ancient Parliament buildings and their modern extensions to ruins. Three years anterior to that misfortune a Select Committee was appointed and many authorities were examined, including several eminent architects. It was decided to recommend the erection of a new House. The authorities came to the conclusion that the historic Chapel of St. Stephen, long used as an assembly place for the Commons, could not be properly enlarged, ventilated or adapted with due regard to the general convenience and health of the members. Sir John Soane had in consequence of this resolve been employed to prepare a plan of the whole of the existing premises adjacent to Westminster Hall, showing the lay-out of the property, which ultimately furnished the site on which Sir Charles Barry's buildings now stand. Benjamin Wyatt also was set to draw out for the Committee a detailed plan of the old House of Commons and its surrounding offices as existing at that day. We reproduce both these plans in this issue; they give an excellent idea of the problem then about to be solved. The question, however, of providing better accommodation for the Second Chamber was by no means a novelty and had long been considered. William Kent, the Surveyor-General, prepared a plan for a new House in 1739, and it had been adopted by the Government under the approval of Speaker Onslow. James Savage, when giving evidence before the 1833 Committee, produced a copy of this plan, which we are enabled to illustrate with these notes (Fig. 3).

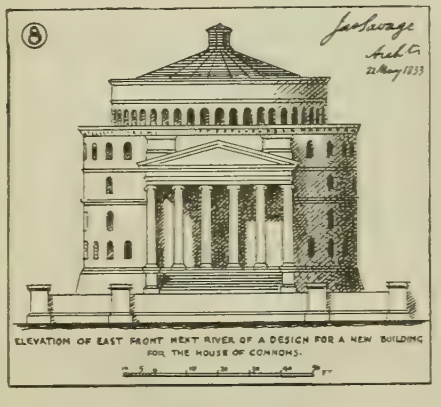
Roughly speaking, the available site for a new House of Commons was provided between the East End of St. Stephen's Chapel and the Thames, on the land then devoted to the Speaker's garden. The Committee really instituted a sort of informal competition of plans, as each architect invited to advise the Government had to prepare a scheme, and for this purpose was furnished with a copy of Soane's site plan and Wyatt's detailed plan of the existing seating arrangements long in use by the Commons in what was originally the Collegiate Chapel dedicated to St. Stephen and erected by Dr. John Chambers in 1509 and 1510. It will be interesting to notice in regard to the seating thus recorded that a considerable number of M.P.s in the old House were situated behind the Speaker's Chair. They could not "catch his eye" and the position must have been very inconvenient. However, it is the evidence that Mr. Adam Lee (who was called the "Labourer in Trust" to the Houses of Parliament, or, as we should now say, the "Clerk of the Works") when asked why he had reproduced in his plan

Section on the line A·B·

SIR JOHN SOANE'S DESIGN A·D·1833.

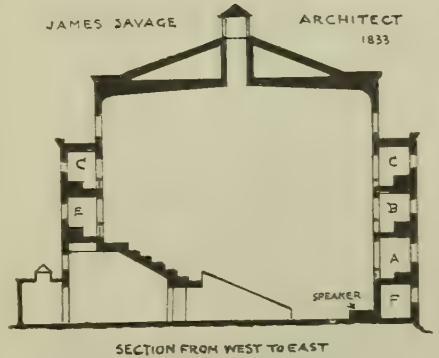
for the new House of Commons this contrivance of seating of the old one, replied that he was induced to conform to that arrangement, never having heard of any complaints in that respect, although he had been constantly in communication with all the members during his 26 years of office. Such seemingly was the custom of habit.

The following were engaged upon this enquiry, viz., Sir John Soane, James Savage, John Deering, Edward Blore, Francis Goodwin, Decimus Burton, Sir Robert Smirke, George Basevi, Sir Jeffry Wyattville, Adam Lee and George Allen. From these ten distinguished architects and the Clerk of Works we have chosen, as typical of the various solutions presented to the Select Committee, the plans submitted by Sir John Soane, Decimus Burton, James Savage and Edward Blore. Sir Robert Smirke had at that date prepared no design, nevertheless his evidence seemingly most impressed the Government, because at the time of the fire in 1834 he was actually engaged upon preparing plans for the new House of Commons. This disaster naturally upset all calculations. Their limited character no longer sufficed and in the consternation which followed all these schemes propounded by the Select Committee were consigned to limbo and forgotten. Many of the old buildings were in too decayed a condition, as the evidence shows, for structural extensions. They were incapable of carrying additional weights, parts were constructed of wood, and so it happened that the fire speedily gained headway and soon completed the ruin.



The history of the great competition, in which Barry and Pugin were selected, is another story, better known than the abortive enterprises over which so much skill and expense had been previously expended. These discarded plans are interesting architecturally, nevertheless, and display a distinct capability of no mean order. It is clear also that the political situations and exigences of seating members brought about by the conflict of parties to-day was anticipated, at any rate, to some extent by those who made these designs in which no little imagination and forethought are evident.

Sir John Soane, when he produced his scheme, was close upon 83 years of age, having been in the Government's service for 41 years. His proposal certainly ranked among the most practical, giving an admirable approach through "the old House," which he made serve as an ante-room to the new one, wherein he furnished seats for 600 members. The treacherous nature of the foundations, as he had found in the work done to the House of Lords, necessitated going down through the bed of river mud to the gravel bed below. He was of opinion that the floor of the old House of Commons was level with St. Stephen's original chapel floor. He calculated that the cost of this building would be £38,800. We give a section of it, as well as his plan (Fig. 4).



Decimus Burton was in his early prime of 33 years when he made his oval-like plan, which is typical of his refined taste. It provided seats for fifty peers behind the Speaker's Chair. In order to obtain a spacious lobby he proposed to demolish "Mr. Ley's house," on which the authorities set much importance. His long corridor and secondary means of approach to it through "the old lobby" look less impressive than Soane's scheme. "The old House of Commons" he preserved for public business during the erection of the new one and he intended to restore this chapel to its original beauty. The external style proposed for his new structure was to conform with that of the new Library. £41,000 was named as the probable expense (Fig. 5).

James Savage, architect of St. Luke's Church, Chelsea, the first stone-groined church erected in the nineteenth century, also built extensive buildings in the Temple. He proposed to reinstate the Edwardian Chapel of St. Stephen. We give a section of his circular legislative chamber so as to show how his external galleries were intended. The complete circle was adopted, he said, because it combines advantages for seeing and hearing superior to any other. "It seats the greatest number within the smallest circumference and brings everyone nearest to a given point (collectively taken) and the extreme distance between two persons in less than in any other shape. The Speaker's Chair is placed against the wall at the east end." A crowded house of 684 is allowed for. "Echo is provided against by ventilation, by which a constant stream of air is constantly passing out at the apex of the ceiling." This is not flat but covered and tilted. The Whispering Gallery of St. Paul's has an echo chiefly from above, but the surrounding plain wall, 17 ft. high, acts as a conductor and reverberator of the sound as the speaker's voice is heard on the opposite side across the dome of 112 ft. Facing the river, Savage proposed a portico, as shown by the elevation here given. The cost of the house itself was stated to be £27,000.

Edward Blore (architect to Westminster Abbey) adopted the octagonal shape, 80 ft. in diameter, with a vaulted ceiling like the Chapter House at York. £17,000 was the estimate. The central floor space being rather restricted with the table in the midst, was objected to by some of the Committee, resembling as it does a spectacular "cockpit."

SECTION FROM WEST TO EAST

A PEERS' GALLERY BEHIND THE SPEAKER
B REPORTERS' GALLERY OVER PEERS
C STRANGERS' GALLERY
E MEMBERS' GALLERY TWO THIRDS ROUND HOUSE
F CORRIDOR ALL ROUND THE HOUSE

Although the purpose for which these designs were prepared was frustrated by the memorable fire of 1834, it would be a mistake to overlook their importance, accompanied as they were by the expert advice of the pick of the foremost architects in active practice during the reign of William IV. The reports of the Special Committees materially assisted the Commissioners when the conditions and schedules of accommodation had forthwith to be worked out as the basis of the open competition for rebuilding the Parliament Palace at Westminster. Much valuable information about international methods as compared with British needs and traditions was ascertained, not only by the enquiry of 1833, but also during a preliminary investigation held in 1831, appointed by the Government to consider the possibilities of adapting the old House of Commons to up-to-date usage. Benj. Wyatt, Robert Smirke and Sir Jeffry Wyattville, the architect of Windsor Castle, were engaged to examine the old buildings, and in accordance with their conclusions a new House of Commons was proposed to be erected, as herewith illustrated and explained. The old House at most only accommodated 342 members and the old lobby, 33 ft. by 30 ft., was occasionally crowded by 300 to 400 on a Division, hence the congested conditions then existing.

It will be useful, in conclusion, to briefly summarise a few facts, not readily available, about this great competition, instituted in 1835, for the new Parliament buildings. The Commissioners made their own awards and do not appear to have engaged professional assessors. The Government undertook to pay premiums of £500 to each competitor whose plans were recommended by the Commissioners, and if the chosen design was not carried out its author was to receive an additional £1,000. Charles Barry was appointed in 1836, on the distinct understanding that his estimate of £724,986 should be binding. The other prize-winners who received £500 each were tabulated in the following order, when the exhibition of the drawings was held at the National Gallery, viz., William Railton (1803–1887), architect of the Nelson Monument in Trafalgar-square; J. C. Buckler, with C. A. Buckler (1804–1904), architects for the rebuilding of Arundel Castle for the Duke of Norfolk; and David Hamilton (1758–1843), associated with Thomas Hamilton (17[illegible]4–1858), famous Scotch architects and founders of the R.S.A. Ninety-seven designs comprising 1,200 drawings were sent in.

The total cost of Barry's Parliament building up to October, 1852, amounted to £1,506,845.

Southport War Memorial.

In the description of the Southport War Memorial in our issue of December 21 last, the height of the obelisk was stated to be 87⅞ diameters; this, of course, should have been 8⅞ diameters. The sculptor responsible for all the modelling and carving on this memorial was Mr. H. Tyson Smith.

Liverpool Cathedral.

In July next the twentieth anniversary of the laying of the foundation-stone by King Edward VII will be recognised by ceremonial and public celebration. It is probable that the King will associate himself on that date with the formal opening of the first, but the most costly and the most elaborate, of the three sections into which the building, according to the design of Mr. G. Gilbert Scott, divides itself.

This section comprises the whole east end of the Cathedral—namely, the choir and its aisles to the first bay of the great central space, which conform to Gothic ecclesiastical architecture. The portion to be opened next year will include two of the four transepts which are to flank the great central space; also at the east end of the building the vestries reached by the ambulatory, and also the chapter house, which at the north-east corner of the Cathedral will balance the Lady Chapel at the south-east.

The portion of the Cathedral to be opened next summer will represent an expenditure of half a million sterling.

THE COMPLEAT ARCHITECT.

By DUDLEY HARBRON.

XII.—PERMANENCE.

THE ruthless pursuit of fitness seems to render permanence a needless quality, but singularly building which is not permanent is never architecture. Fugitive work, no matter however grandiose, is like clay models, wax flowers and tin toys, on the way to the dustbin. In Nature we are satisfied that she will repeat herself, and consequently, though we have regrets for the fading rose, we do not let them affect our judgment, but in art we feel that the need for the substantial embodiment of the most furtive notion is a first requisite to its appreciation. Impermanently represented we do not value the idea. Valuable ideas we consider are worth perpetuation. Casually cast-off like the man who claimed to have invented matches, we prefer the title of inventor to go to the man who made them and sold them tangibly to his friend .

Industrially, politically, emotionally, the times in which we live and work are not such as to conduce to permanence. No man is sure of what to-morrow may bring forth. But then they never were sure, but they had faith. We have lost that, and the only certainty we hold is that to-morrow will be unlike to-day. Symptomatic of the times, manufacturers desire factories with elastic walls, capable of expansion or contraction in time with the pulsations of trade. Regretfully we admit that they may get their own way, and be provided with concertina-like contraptions with zigzag walls, running, as folding doors do now, on rails, but he would be courageous who could contend that such ingenuity could ever call itself architecture. Curiosities of this order please the readers of the penny press, who delight in particulars of the Chateau Dufayel and its mechanical wonders. But, instinctively, we know that these tendencies are not fruitful branches of the architectural tree, and that along these lines architecture is being left behind at the junction, and is not, as some appear to regard it, the terminus.

Strive and contrive as we may, no work of man is actually permanent; the best can only be relatively so. The quest for a static condition in form and material which shall defy the encroachment of time and satisfy the "passion for perpetuation" is responsible in part and recognisable in all of the greatest architectural achievements. The desire for permanency is a very primitive emotion. Upon it the belief in eternity has been reared. "O man, live for ever!" was the message of the Creator to the created, but the messenger, the hare, arrived too late, though the purport of his communication has reached our ears.

Romantic scientists having located creatures, amœba, that, escaping accident, live for ever, draw long bows for humanity. Matter, they tell us, is indestructible. Not unnaturally, man is jealous. He seeks through durable material and considerate form to satisfy his natural aspirations and endure in his work. He finds within, the eternal amid all the shifts and tremor of the passing scene. Stability is essential; cracks and fissures discredit the master. Quality is implicit—the capacity to survive, to serve the perpetual needs of humanity. The desire to achieve permanence has misled artists into the error that size is in itself a sufficient and noble attribute, that through magnitude permanence and grandeur could be attained. Great monuments may impress, yet it is other qualities beyond sheer size which render them noble. Vastness alone is the most easily recognisable hideousness. Though by their bulk the makers may have thought to attain permanence, they have indeed courted destruction, when as in allegorical Babel and actual Hadrian's Wall, they had not other qualities to recommend them. Size must respect all the conventions required in smaller works; beyond reasonable dimensions they defeat permanency, and coins survive where larger images are in the dust.

The spectator looks for durability in a work of art. Time and pains are not usually expended upon perishable material, the recollection of this prescribes to some extent the attention with which the work is studied. Actually the artist expresses himself from poverty or handiness in the medium readiest at hand—clay-crayon, but he is himself at pains, as soon as may be, to see his conception in material form as nearly permanent as he can, and he is disappointed if this consummation is not effected. So often has he succeeded that it is almost accepted as a fact that no work worthy of perpetuation has escaped its reward. But it is not true, though it cannot be proved, and the Fates, it must be acknowledged, are inclined to leniency. Cezanne threw his masterpieces into the nearest hedge, but a careful collector of unconsidered trifles picked them up. Whistler destroyed those paintings which he considered unworthy to survive, seeking thereby to more firmly guarantee his reputation with posterity. For architecture there are no such adventitious aids; to live, buildings must have merits commending them to men as to nature.

The present generation appear to be so fickle that one is almost tempted to regard lasting qualities as a form of extravagance. Though we save in patches we are afraid that the suit will be a misfit because we have altered in our proportions. A complete system of thought is based upon "the fallacy of saving." Already it has overthrown the makers of every article from motor-cars to collar studs. Building cannot follow fast enough. Though the truth is that impermanent needs should be temporarily housed. For timid souls the creed of the momentary has an undeniable fascination; so much can be excused as extempore. For there is nothing more salutary than the realisation that what one does lasts, short though its life may be, longer than ourselves.

In durability lies the reward of the forward-looking mind—the consciousness of right, the courage to foretell. It is to be attained only by the struggle to excel.

Equestrian Statue of General Gattamelata, Padua. By DONATELLO.

CORINTHIAN CAPITALS.

SIR BANISTER FLETCHER, in a recent lecture at the Central School of Arts and Crafts, dealt with the study of the origin and use of the Corinthian Order, which was Greek by birth and Roman by adoption. The Greek love of the beautiful and their gift for developing art-forms tempted them, for a time, away from the sturdy Doric and the simple and slighter Ionic to that more varied and ornate combination of nature-forms which became known as Corinthian. Doric and Ionic were both tribal names, but Corinthian bore no such meaning.

Some of these early capitals were in bronze, a metal worked in Corinth by a certain Callimachus, and thus known as Corinthian bronze—much as we called a certain product "Sheffield plate." So the material might have given the name to the style. He considered that, as to origin, it was hardly likely that the new Order was suggested by the anthemion necking of the Ionic capitals of the Erechtheion, because that did not account for the altered shape and increased height. It was more probable that Greek artist-craftsmen, who ever sought some new thing, seized upon the Egyptian lotus and papyrus prototypes at Karnak and Philae, and from them reproduced the bell-shaped capital, sheathed in tiers of carved acanthus leaves and curling calices. Greek imagination was strong enough to create the Order, but Greek love of simplicity was stronger, and the Order was little used by that nation, except in small buildings, like the Choragic Monument to Lysicrates and the Athenian merchant's "Tower of the Winds,"

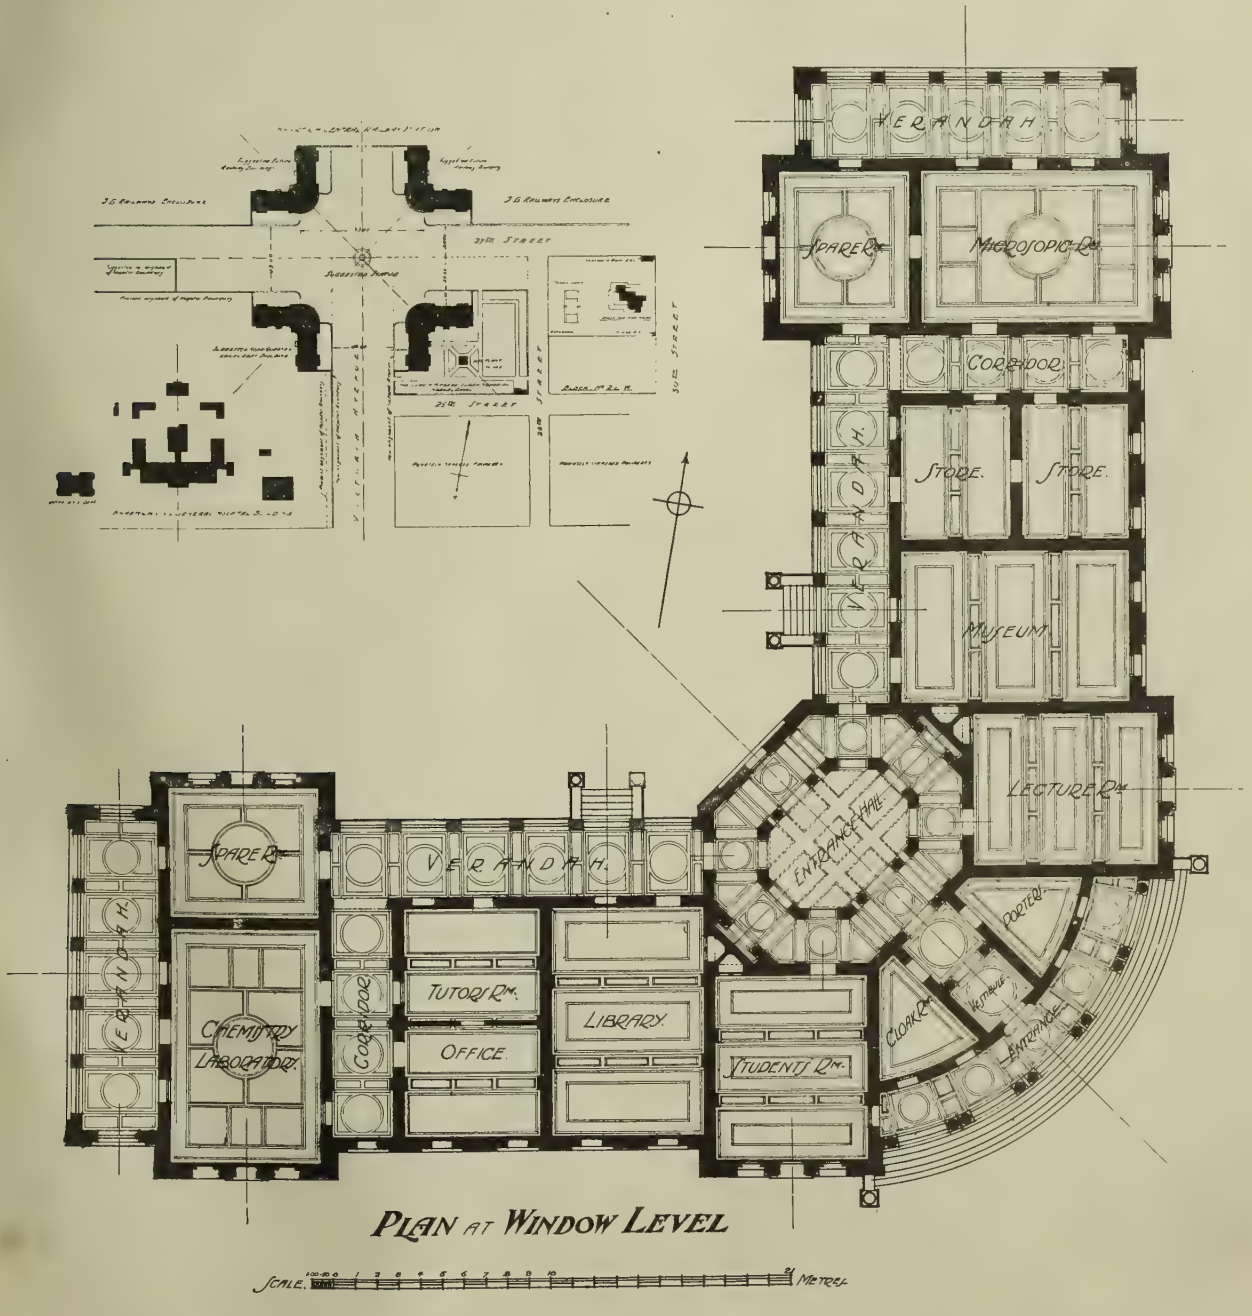
"THE BUILDER" NEW YEAR NUMBER.

The Special New Year Number of "The Builder" will be published next week, January 11.

ILLUSTRATIONS.

New Headquarters of the Society of Friends, Euston-road.



These drawings are reproductions of the competition plans selected in the recent limited competition. The building is to occupy nearly half the vacant site on the Euston-road opposite Euston Station, the other portion being reserved for a temperance hotel with formal gardens between, which, in conjunction with the 30 ft. set-back which the Council demands, will be a great improvement on this part of the Euston-road.

The building is designed in three portions, the centre being reserved for large and small meeting houses; the former (entered through a portico on the Euston-road front) will seat, with galleries, 1,500 persons. The small meeting house is placed at the back and will seat about 250. The east portion of the building comprises administrative offices, committee rooms, library and institute, grouped round an open meeting house yard connected by cloisters with folding doors for use in warm weather. The upper portion of this block comprises offices for the use of the various associations allied with the Society of Friends. The west portion of the building is a self-contained block of office property with a possibility of extension on demand. The lavatories for the meeting house are in the basement, where also are strong rooms, the former with ample light from the areas, the latter without an area. Simplicity has been observed in both planning and detail, the frontages being in grey brick with Portland-stone dressings.

The architect is Mr. Hubert Lidbetter, A.R.I.B.A. The perspective drawing is by Mr. A. C. Fare, of Bristol.

Taunton War Memorial.

The successful design by Mr. E. Vincent Harris, F.R.I.B.A., is admirably direct and compact in its lay-out; all the rooms are easy of access and well lighted. There is a spacious Memorial Hall with the memorial tablet in a recessed space centering with the main entrance; thus the object of the building is not lost sight of. The elevations, of Gothic character, are well balanced, a feature being made of the main entrance with a bay-window over. The scheme is treated in a restrained and dignified

The Kitchener Memorial Medical School, Khartoum. MR. G. B. BRIDGMAN, A.R.I.B.A., Architect.

manner. The building should come within the stipulated price of £10,000. Mr. Robert Atkinson, F.R.I.B.A., was the assessor, in conjunction with Mr. Howard Robertson.

Lord Kitchener Memorial Medical School, Khartoum.

The Lord Kitchener Memorial Medical School, Khartoum, was designed by Mr. G. B. Bridgman, Town and Divisional Engineer, Public Works Department, Sudan Government. In execution the entrance-hall was replanned to form a true octagon, as is shown on the perspective drawing.

Thuparama at Polonnaruwa, Ceylon.

This oblong brick building with a square tower was built for the image of Buddha in the second half of the twelfth century, during the reign of King Prakrama Bahli. The roof is a barrel vault, and above the image-room the square tower is supported by massive bracketed walls. The style is Dravidian. Externally the space between each pair of pilasters is decorated with a Wimana of a deity suggesting the appearance of a hooded window.

The drawing is by Mr. A. B. Mendis (Travelling Student of The Royal College of Art, 1922).

King's College, Cambridge, Entrance Gates.

These drawings show the designs placed second in the recent competition for entrance gates to King's College, Cambridge, by Mr. T. S. Bowman (Messrs. Cashmore, Bowman & Co., Ltd.). The intention was to have the Arms of Cambridge as the centre motive in the fixed grille over the gates executed in enamel and supported by bronze sea-horses. The Arms of King's College and Eton College were worked into the main gates as a centre upon which to build the ornament, which is after the Jean Tijou style. In the side wickets the monograms of the two Colleges were used in the panels.

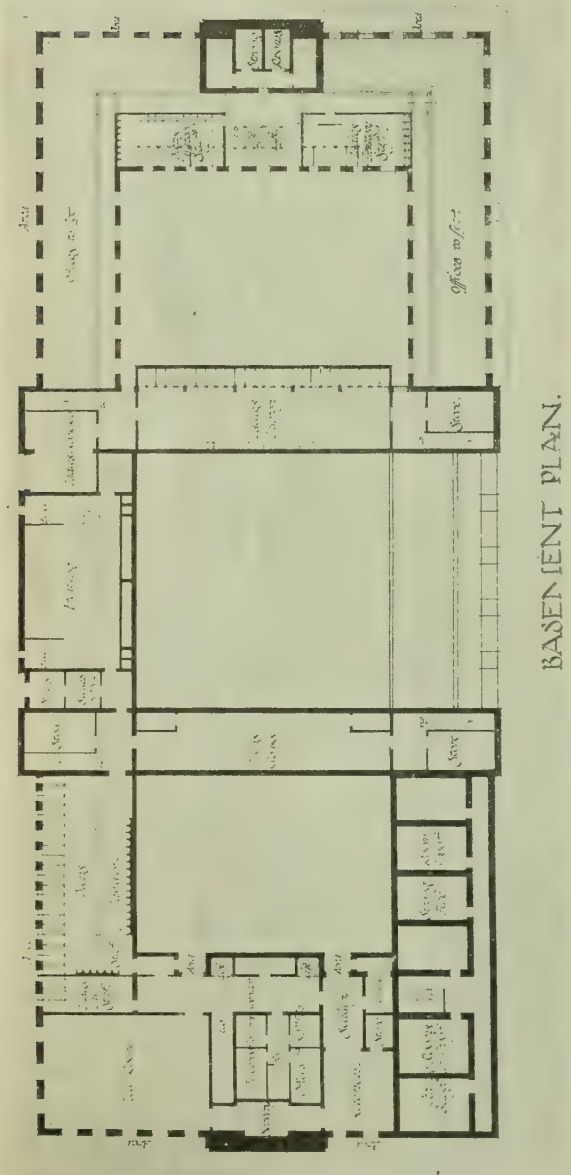
MEETINGS.

SATURDAY, *January* 5.

Messrs. A. Roberts & Co., Ltd.—Annual Dinner. At Café Royal, Regent-street, W.1. 7 p.m.

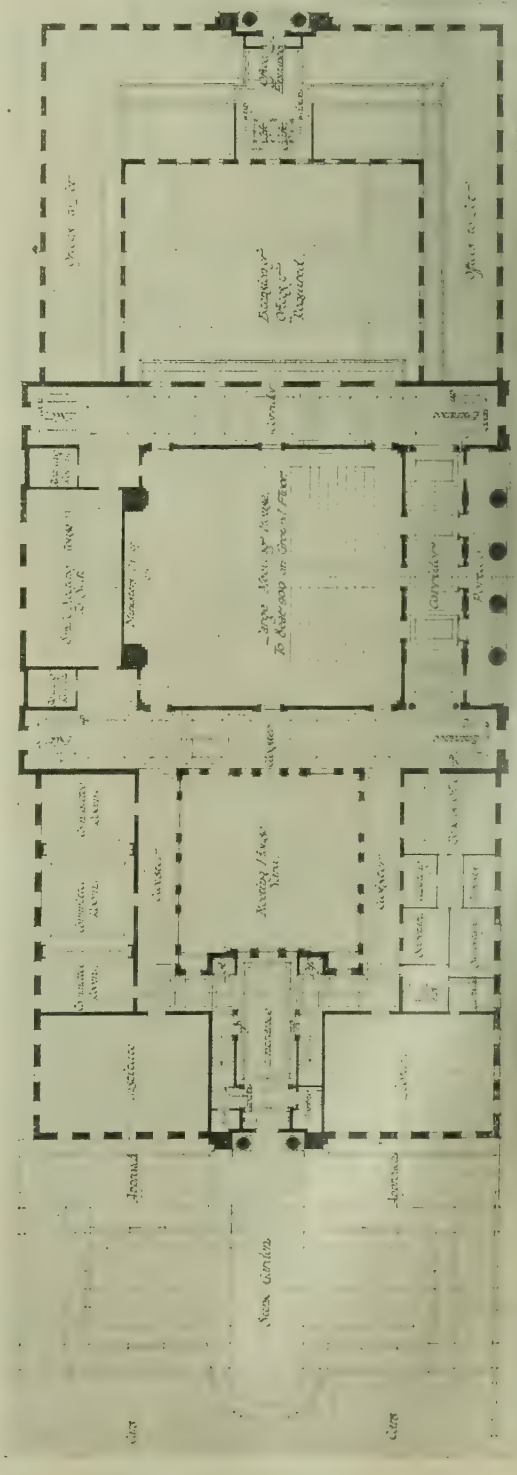
MONDAY, *January* 7.

Institution of Electrical Engineers.—Discussion opened by Mr. E. H. Shaughnessy on "Troubles Experienced with Domestic Electrical Appliances." At Savoy-place, W.C. 2.



Surveyors' Institution.—Mr. D. T. Thring on "Economics of Estate Management." 8 p.m.

TUESDAY, *January* 8.



Liverpool Architectural Society.—Mr. T. Fyfe on "The Study of the Past."

THURSDAY, *January* 10.

Institution of Heating and Ventilating Engineers.—Mr. F. Lindsay on "A New Universal Regulator for the Control of Temperature, Pressure, Humidity, &c." 7 p.m.

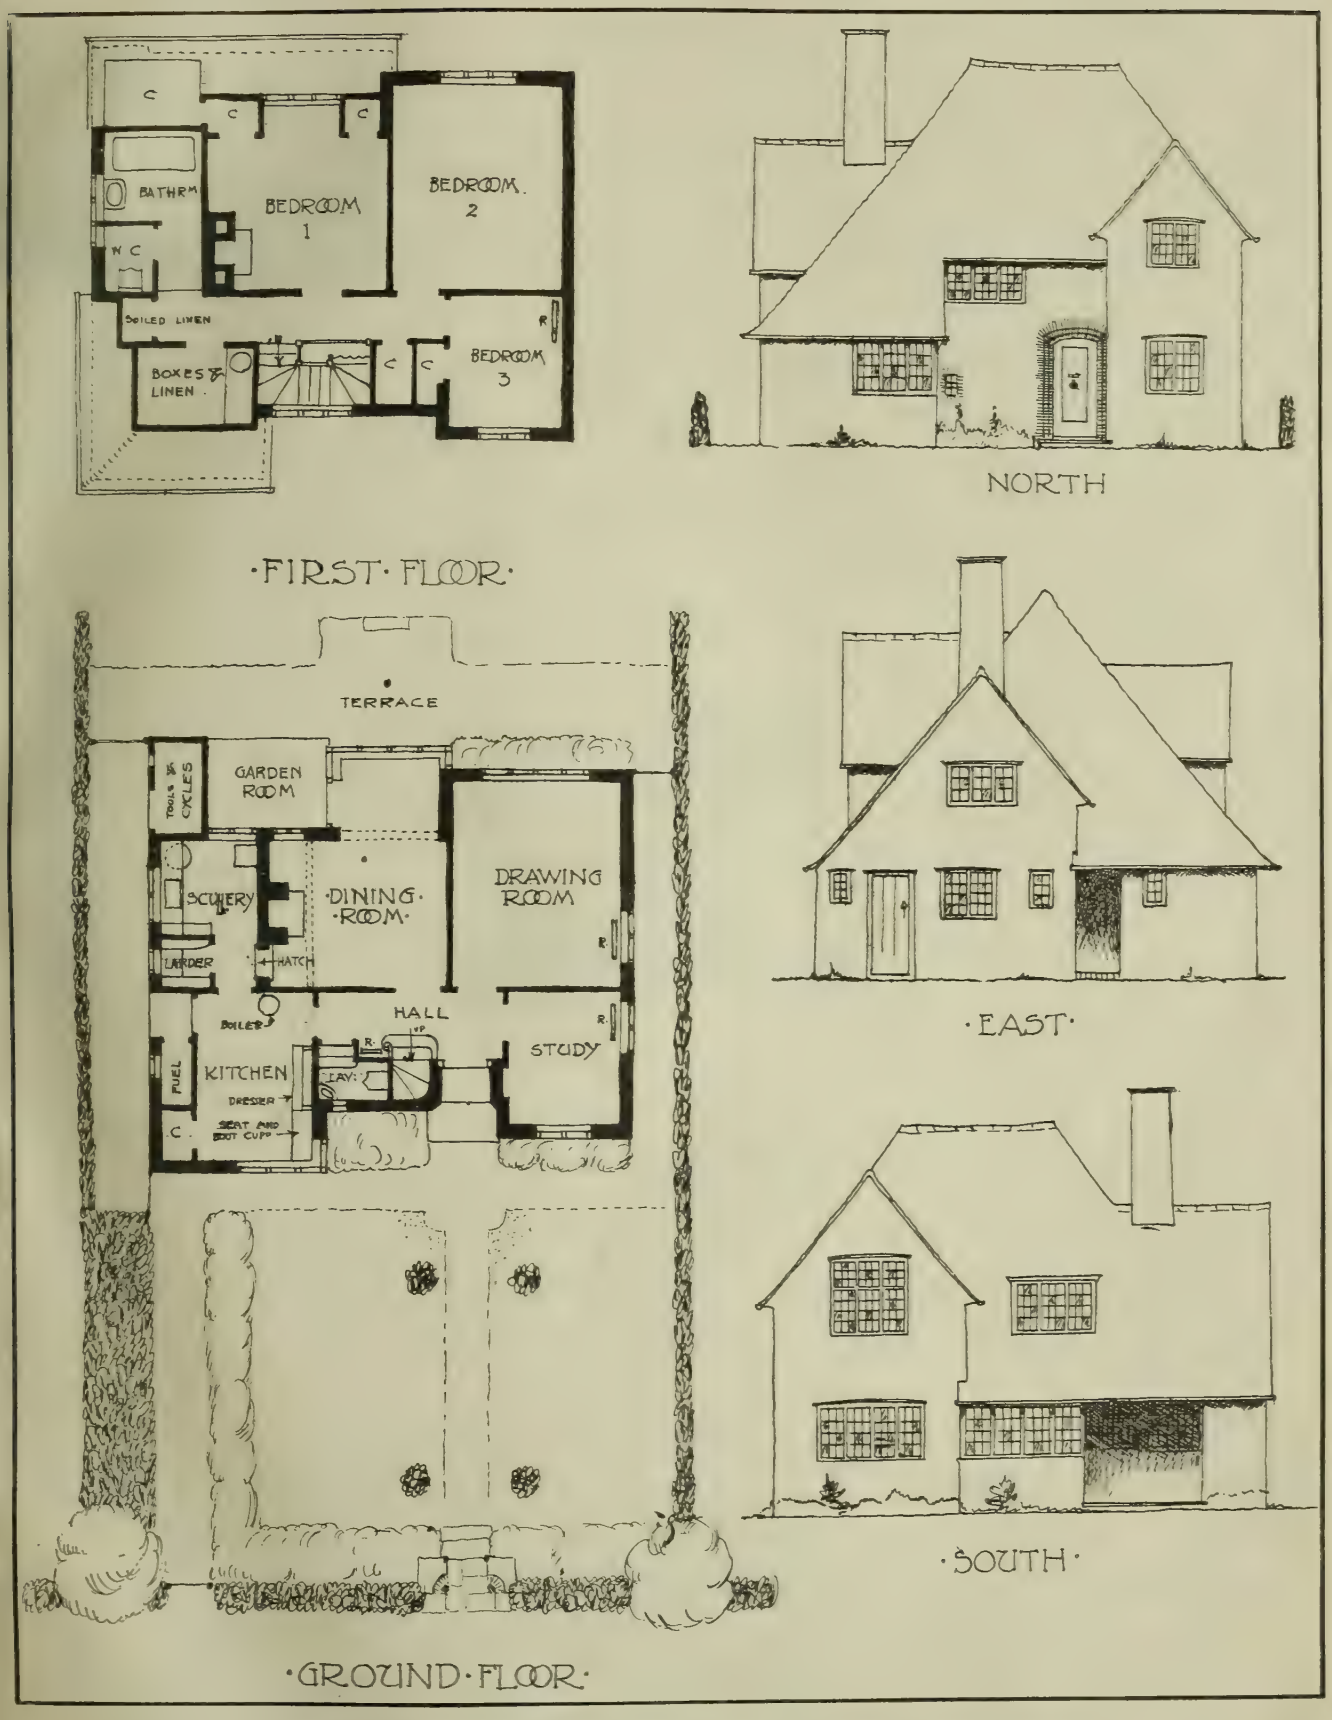
"Eastoft" Hale, Cheshire for G. Empson Esq.



F. P. Oakley & G. Sanville A.A. R.I.B.A.
Architects, 60 King Street, Manchester.

The site of this bungalow is situated on the Hale-road, and rises sharply from the road, falling again towards the south-west end. It was, therefore, impossible to arrange a formal court having the gates on the main axis line for the entrance; a further difficulty in the site was its narrow width and the necessity of having to set back from the side boundaries. In consequence only secondary rooms could be placed at the side, the entrance and garden fronts being reserved for the principal rooms. In planning the interior care was taken to keep the bedrooms, bathroom, &c., kitchen, and offices quite apart from the hall and living rooms.

The bungalow is built of 2½ in. common bricks and roofed with Delabole slates, the window frames being painted white. For the inside the finish is of the simplest description, the walls being plastered and distempered, and the floors boarded and wax polished. In the kitchen the floor is tiled with red tiles, and the walls have a dado of white Dutch tiles 4 ft. 6 in. high; this treatment has also been adopted in the bathroom and w.c., with the exception that a composition floor has been used instead of tiles.

The contractors for the work were Messrs. L. Brown & Sons, of Wilmslow, Cheshire, and the sub-contractors were:—Messrs. Setchell & Co., Deansgate, Manchester (slating); Messrs. Williams, Gamon & Co., Kaleyards, Chester (steel casements and lead glazing); Messrs. Shanks & Co., Deansgate, Manchester (sanitary fittings); Messrs. W. & R. Leggott, Bradford (ironmongery); Messrs. Williams & Co., Carr-street, Manchester (wall tiling); Messrs. E. Wood, Ltd., Station-buildings, Altrincham (electric lighting); Messrs. E. Hart & Son, Bank-street, Salford (wrot ironwork). The contractors for the garden were Messrs. Caldwell & Sons, The Nurseries, Knutsford. Messrs. Frank P. Oakley & Gerald Sanville, AA.R.I.B.A., are the architects.

House in South Hill-avenue, Harrow. MR. A. PERCIVAL STARKEY, Architect.

[This house has just been erected at Harrow with Buckinghamshire multi-coloured bricks, and roofed with hand-made sand-faced tiles. In the planning a good deal of consideration has been given to the question of saving labour as far as practicable. Two fireplaces only have been arranged, one up and one down, the warming of the house being mainly done by central heating, with an electric radiator in each of the rooms. The cooking is by gas. There is a serving hatch between the dining-room and lobby to scullery, beneath which is a small cupboard for china in daily use, and accessible from both sides; beneath that again are coal and log boxes, also accessible from both sides. Ample box room and cupboard space have been provided. The general contractors are Messrs. Smith & Pope. The electric light installation was by Messrs. Waring, Withers & Chadwick; the central heating and hot water domestic supply by Messrs. Potterton; Messrs. Geo. Wragge, Ltd., supplied the steel casements and leaded lights. The architect is Mr. A. Percival Starkey, Harrow.]

HOUSING WORK IN AUSTRIA.

By EWART G. CULPIN.

In Austria, with the stabilisation of the crown, which hardly varies from the figure of 320,000 to the pound, as against 20 pre-war, matters are approaching normality in some directions, although the old middle classes and those who existed upon rents and dividends appear to be absolutely ruined, and it has been nearly as bad for professional people. For those between the upper and nether millstones it is extermination or work.

In the shops and stores there is every evidence of stability, although there is also every evidence of the heaviness with which life is pressing upon the poorer classes and the lower-paid wage-earners. The average wages are about K. 300,000 to K. 350,000 a month, those in the building industry being K. 380,000, or about 25s. a week. Various items of food, fruit, etc., are cheap, but the generality of goods are practically identical with what one would pay in this country. In Germany prices alter from hour to hour, and in my own experience prices went up during a day tenfold, and shopping was a nightmare.

It must not be forgotten that Vienna, which was formerly the capital of a huge empire, is now the chief city of a small republic of about 6½ million people, and has a population out of all proportion to its ability to feed them. From five to ten per cent. of the population of the city is dependent upon relief for their existence, and as under the agreement imposed by the Commission of the League of Nations some fifty thousand more officials are now being discharged—including a huge number of teachers—these figures will be accentuated.

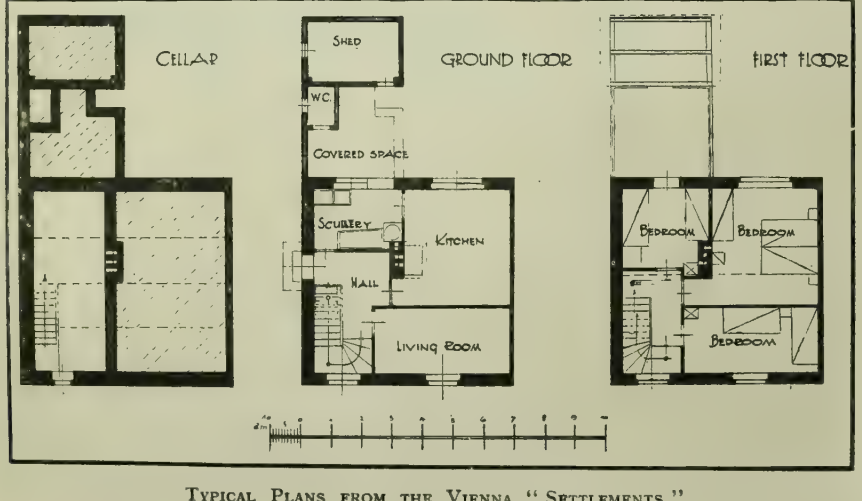
It may be as well to glance at the legislation affecting building and the building trades. As in this country, the difficulty of providing workmen's homes arises from the impossibility of building at such a price as will yield a rent which will give an economic return upon the capital invested. Under the rigid rent restriction Acts of March, 1923, rents are fixed at 150½ times that of July, 1914, which averaged 30 kronen a month. So that the weekly rent is now equal to about a penny! (This figure was given me by one of the chief officials of the city of Vienna. Another official, however, told me that the cost of rent had gone up three hundred times, while the cost of building had increased fifteen thousand times. For the purposes of this article it matters little whether the rent is a penny or twopence a week.) This, I believe, constitutes a record of rent restriction. There are some variations for repairs, but these appear to be so stringent that there is no possibility of the landlord getting more than his thousand crowns or so. A landlord, therefore, with twenty houses, which previously brought him in the equivalent of about £7 10s. a week, now has less than 2s.! As in this country, there is no rent restriction for new houses, but nobody builds, despite a system of subsidies, because nobody can afford to pay the rent demanded.

In Vienna there are said to be 34,000 people wanting houses, whose needs are never likely to be satisfied. The municipality is building about 2,000 apartments, consisting of a room and kitchen, at an average cost of ninety million crowns, or about £300. To provide a part of this money a building tax is levied upon all old buildings, based upon the rental value of the premises. All those with a rental of K. 3,000 pay a building tax of 100 per cent., and for each K. 3,000 another 100 per cent. is levied, so that the figure goes up to 3,000 per cent. of the rental value.

Practically the whole of the new housing work in Austria is being done through the "settlement" schemes, which, to a large extent, owe their existence to the work of the Society of Friends, and the desire of

All Houses in Austria have Double Casement Windows as a Protection against Winter Weather.

that body to give their relief in some shape which would have permanent results, and actually help people to help themselves instead of merely pauperising them. The great need of Austria after the war was for food and houses. The new Austria is so carved up that 95 per cent. of all the country requires has to be imported, and the prices which are demanded are beyond the resources of the ordinary folk to pay. Therefore the Quakers decided to settle the people on the land, build them a modest home, little more than a hut, and let them raise food for their consumption and for trade. Vienna possesses an enormous quantity of land in its town forest, the admiration of many English municipal councillors who have visited the city; timber exists in unlimited amount, and the capital has been provided by the Government, by the town, and by the settlers themselves in co-operative effort.



One of the Isolated Buildings. Others may be seen on the Hill-side behind, just below the Forest.

The city has now taken up the matter in earnest, and is doing much good work, always in co-operation with the Friends' Relief Mission, whose endeavours are most warmly acknowledged everywhere, and, indeed, the public gratitude is sometimes recorded upon tablets inserted in halls and other buildings with which they have been connected. At the head of the city of Vienna settlement work is Dr. Hans Kampffmeyer, well known to English housing reformers as a strenuous worker in the garden city movement and a prominent figure in all international housing conferences.

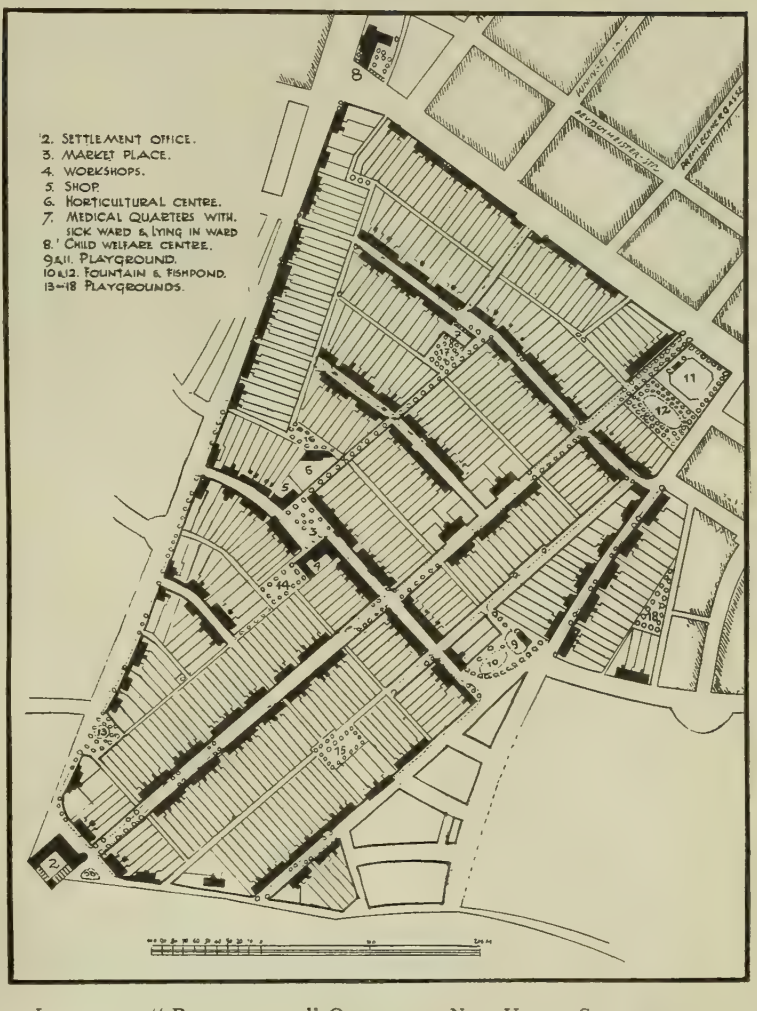
With Dr. Kampffmeyer I visited a number of the settlements, and inspected both the housing and the smallholdings, and attended a flower, fruit, and produce exhibition on one of the settlements. Here were displayed not only the customary articles, but poultry, rabbits, goats, fruit essences, honey, drugs distilled from crops, and so on, all grown on the settlement, which had no existence two years ago, and grown and reared by men and women who had never turned the soil previously and never imagined they would live in a house of their own.

The settlements are springing up in every direction in the outer environs of Vienna, and other organisations are following the lead of the Society of Friends. There are at present about fifty of these settlements, some large and some smaller, but all contributing to the vital necessity of the city and the country—the production of food—proving that it is possible, even within the diminished borders, to support a healthy population. Attached to the settlements are central farms which are co-operatively managed, and there are also co-operative workshops, where thriving industries are becoming established, and where the joinery, household utensils, and furniture for the settlers are made at a lower rate than they can be purchased outside.

The whole system is throughout co-operative in basis. To obtain the Government assistance the management must be by a public utility society on a co-partnership basis and everything is done to ensure proper and easy working of these societies. There is a central association, which is recognised by the Government, and this body not only assists in formation and management, but gives practical assistance all the way through. The Government has representatives on this association, and everywhere it is recognised that it is in this modification of garden city principles that the chief hope of the regeneration of Austria lies. And as the official aspect is friendly towards the settlements and the settlers, so the societies recognise gladly the

Typical Plans from the Vienna "Settlements."

help they received from the Government and the city authorities.



The settlement work started in 1921, and by last spring 600 houses had been built. The money allotted by the State and the city provides for the completion of 1,050 houses, all on a co-partnership basis. The State has voted K. 8,000,000,000 and the city K. 50,000,000,000, with an extra five milliards for experimental purposes. All the experimental work is done by a society formed by the central association, and known as the Gesiba, formed of the initials G.S.B., of the building co-partnership. It was found that the societies, and indeed the Government, were entirely unable to secure building materials at reasonable figures, and, as was the case in Belgium, a central purchasing agency was set up. All building materials are provided by it, and not only has it been able to get its own material cheaply, but the result has been greatly to reduce the demands of the trusts. Its efforts have been in the highest degree successful.

Land is provided by the town from the enormous area of the Wienerwald on low leasehold terms, and money from the State and town, and some from the Gesiba, with the help of the Society of Friends in addition. Unfortunately, funds are inadequate for the purpose, the sum allocated in last year's Budget having had to be cut out.

Land being secured, the Gesiba gets to work. If the Society has not its own architect it provides the necessary technical assistance for plans and lay-outs. All plans have to be approved by the City Settlements Department. In many instances the houses are very small and dotted about the holdings; in others, the houses are built in communities, with the land grouped round about; the photographs accompanying this article give examples of both. In addition to the actual settlements there are many colonies of smallholders, all of whom hope for a house of their own as time goes on. The official figures show that whereas in 1915 there were 3,000 of these, the figure has now grown to 70,000.

It should be explained that the money lent to the settlers is lent and not given, and it is a striking testimony to the abundant success of the scheme that it was possible for 25 per cent. of the Friends' Mission Loan to be returned last year out of the profits, and it is hoped that 50 per cent. will come back as a result of this year's harvest. The money thus liberated is being used in further loans and in stocking new settlers. The Friends themselves have established 400 families on the land, but their waiting list contains another 4,000!

I have mentioned the assistance given by the State and the city (which previously undertook two-fifths of the responsibility), and I was curious to find how the impoverished settlers found their contribution to a co-partnership. It appears that each settler, before getting a house, has, in addition to a small monetary payment, which in some cases is supplied on loan by the Friends, to give 2,000 hours of voluntary labour to the settlement, either as bricklayer, labourer, clerk, or what not, and as all classes are involved a new order of existence is being worked out. Labourers, brain workers, artisans, artists, are all involved and all needed, and it is reported that this voluntary labour idea has been abundantly justified.

LAY-OUT OF "ROSENHEUGEL," ONE OF THE NEW VIENNA SETTLEMENTS.

During the early part of September an exhibition of small houses, gardening and smallholding produce was held at the Vienna Rathaus. The square in front was occupied by full-size cottages, and in the hall was set out much of interest and assistance. Perhaps the chief centre of attraction was the *Kernhaus*, to which the authorities have pinned their faith for the moment. It does not come up to the standard of the Addison report, and lacks all the refinements which at one time one thought were to be incorporated into English working-class homes, but it is what its name implies—a kernel house, or a seed house, the beginnings of a house so planned that it can be put up by the exertions of a family—the plan adopted in Belgium in the devastated areas—and added to from time to time. The accompanying plans explain the idea, and the sketches of the interiors show how the space is utilised. It is intended that the building shall proceed in five stages, as follows:—

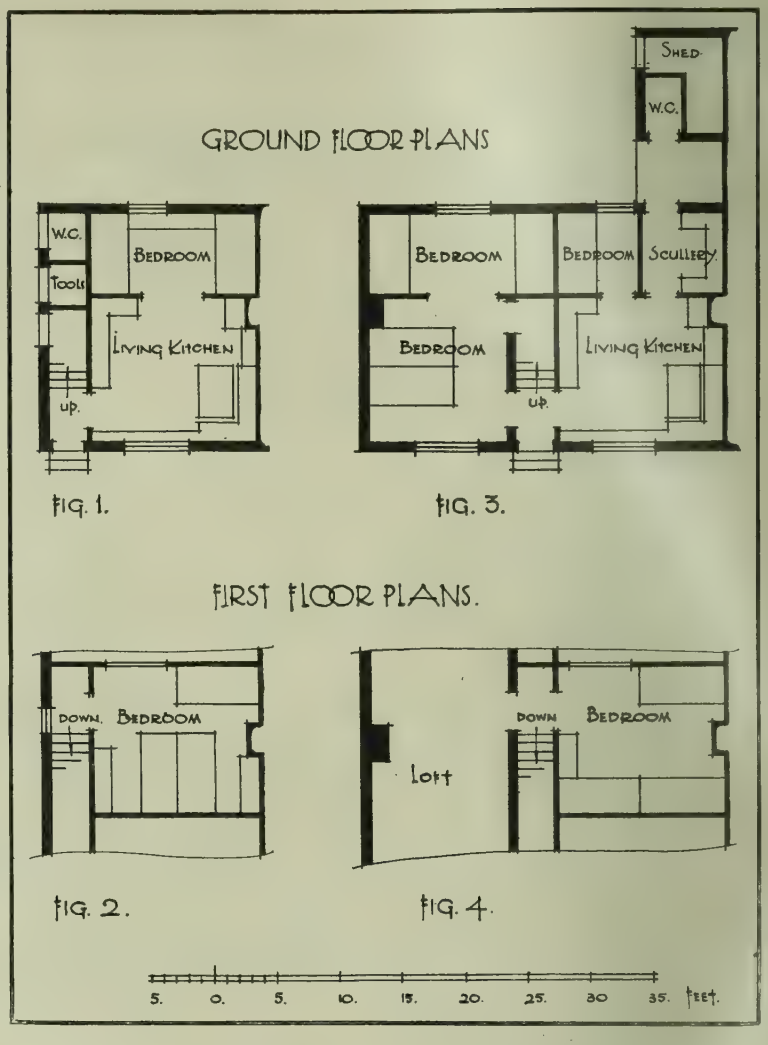
First stage (Fig. 1).—Construction of "kernel" house, covering a floor area of 290 sq. ft., including the provision of stairs to the loft, which may be omitted at this stage. It provides a kitchen-living-room with folding bed, a bedroom with two beds, closet, toolshed, and loft.

Second stage (Fig. 2) shows the transformation of the loft into an attic bedroom with three beds.

Third stage (Top of Fig. 3) shows the addition of outhouses.

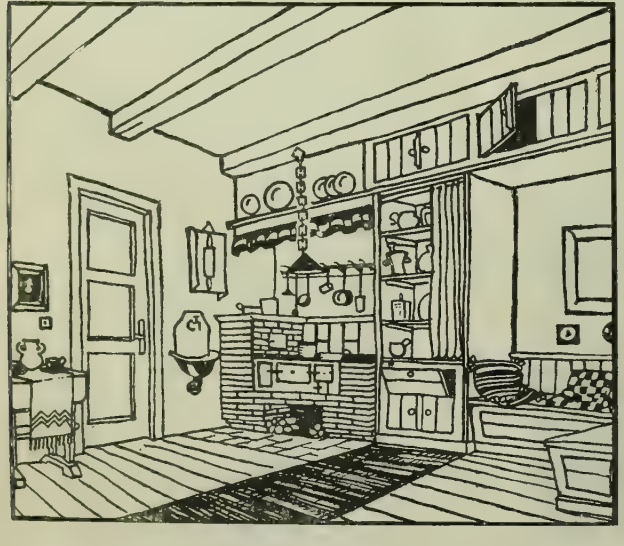
Fourth stage (Figs. 3 and 4).—Here two double bedrooms are added to the ground floor, with a loft over, and the double bedroom of the first stage is converted into a single bedroom and a scullery.

THE FIRST COTTAGES BUILT IN AUSTRIA AFTER THE WAR. PRACTICALLY EVERY HOUSE NOW BEING BUILT HAS THE APPROPRIATE WALL COVERED WITH TRELLIS WORK, UP WHICH FRUIT TREES ARE TRAINED.



VIENNA'S "KERNEL HOUSE." BEDROOM SHOWING BUILT-IN FURNITURE, IN WHICH BEDSTEADS ARE INCLUDED.

Fifth stage.—Where necessary, the new loft (left-hand portion of Fig. 4) can also be transformed into a second double-bed attic.



The completed house has thus developed into a complete settler's house of five rooms and a scullery.

The cost for this "kernel" house for the first stage is at present from twenty-two to thirty million crowns, according to whether it is detached or semi-detached, and as to what is done for a staircase. The free labour of the settler reduces this cost by about seven million crowns. The completed house costs about K. 50,000,000, of which K. 10,000,000 may be saved by settlers' work. In English equivalents these figures are £60 to £70 for the first stage, and £150 complete. The labour saving is from £22 to £31, which, on the wage basis given previously, is about equal to two-thirds the trade union rate. I was unable to find out the official attitude of the trade unions, or how the work was actually done, but it appears to work very smoothly.

Owing to the huge work of preparation for the exhibition it was not possible to obtain all the figures for the settlements, but at the Friends' Mission, which is the refuge of all the distressed and afflicted, Mrs. Bell, the head of the Mission, kindly gave me information of what had been the result of the work in their twenty-three settlements up to the end of 1922. There were large increases last year. The whole details are fascinatingly interesting for anybody concerned with real reconstruction as opposed to mere relief. There are 423 families housed, consisting of 1,681 people. The settlers gave 3,725,523 hours of voluntary labour, a good deal of which was on houses not then occupied. They raised 1,153½ tons of produce, 320,000 litres of milk, and 564,300 eggs. The central farms on 304½ acres raised 408 tons of crops. The co-operative industries carried on comprised needlework guilds, carpenters, lock-

THE EVOLUTION OF THE "KERNEL HOUSE" NOW BEING BUILT IN AUSTRIA.

INTERIOR OF "KERNEL HOUSE" IN THE FIRST STAGE, SHOWING THE COOKING CORNER OF THE LIVING ROOM, WITH ITS BUILT-IN FURNITURE.

smiths, painters, electricians, glaziers, shoemakers, founders, etc.

It was expected that during 1923, completing those houses nearly ready and new constructions, nearly 700 additional houses would be provided, in each of which would be another family. The figures given above, therefore, have to be multiplied by nearly three to get an idea of the position at the end of this year.

Out of the towns and in the villages of Austria there was much of charm, so that one was tempted to forget the stories of poverty in the towns. Quaint houses and wonderful little churches in out-of-the-way spots provided much of interest. Perhaps the most interesting of the buildings seen was the church at the big lunatic asylum, which seemed to stand alone in its decoration. Gold and silver and blue mosaic work constituted a wonderful setting to the altar, and the lining of marble, with the wonderful oakwork of pulpit and joinery, made a very unusual picture of internal beauty. In the heart of the country Nature still smiled, and seemed to enforce the lesson of the littleness of all these political and financial upheavals, and how puny is man and his efforts in contrast. The changeless mountains and eternal snows remain unruffled in their grandeur. The wondrous colouring of hillside and forest, the new floral treasures peeping out from crag and cranny, the plashing rivulet that soon becomes a torrent, the azure sky, the wine-laden air—these spoke peace and calm. And how the people seemed to appreciate them all! The townsfolk on tramping tour, each with a rucksack containing all he needed, men and girls with heavy boots and suitably clad, and with such complexions as only come from intimacy with Nature, were to be met everywhere. A never-to-be-forgotten tour was a trip along the Danube, with its scores of rugged castle ruins showing high up against the sky, almost always perched upon inaccessible peaks.

HOUSES IN HOFFERINGASSE. THEY EACH CONTAIN LIVING ROOM, KITCHEN, SCULLERY, DOMESTIC OFFICES, AND THREE BEDROOMS. THEY ARE BUILT NINE TO THE ACRE, EXCLUDING ROADS.

The Plumbers' Company.

A short history of the Worshipful Company of Plumbers has recently been written by Dr. Waldo. The first official record of the craft is found in the Ordinances framed by the Guild of Plumbers, and approved by the Court of Aldermen in 1365, in the time of Edward III. From the earliest days, he says, the responsibility of the plumber has been emphasised in the frequent exhortations extended to him to perform his work "well and truly," and in the numerous penalties that awaited any shortcoming in that direction. The Company have pledged themselves to the policy of compulsory registration, if obtainable, on lines similar to those adopted in the Act for the Registration of Midwives. Dr. Waldo was, in 1921, Master of the Worshipful Company.

Progress Views at the British Empire Exhibition, Wembley.

MESSRS. J. W. SIMPSON & MAXWELL AYRTON, FF.R.I.B.A., Architects.

ETON WALL PAINTINGS.

DR. MONTAGUE R. JAMES lectured recently on this subject at the South Kensington Museum. In the course of his remarks he said that they knew that the paintings were a series of seven illustrating the Miracle of the Virgin, and of figures of saints. They were originally in two rows covering the whole wall space of the three western bays of the chapel. Not everyone had seen the paintings themselves, but Mr. Tristram's copies gave an excellent idea of the style and scheme of colour.

The lecturer recapitulated the history of the paintings, and said they heard of them in 1479, when the painters working in the church had three-and-a-half dozen candles allowed them. In 1500 the college barber was paid 6s. 8d. for wiping out the "imagery" work on the walls. This meant whitewashing, of which traces were perceptible on the existing paintings. At some time in the sixteenth or early seventeenth century, some scheme of decoration in the classical manner was carried out, which had not left any trace he could detect in the accounts. It consisted of classical pilasters, fluted and ornamented at the base, painted at intervals over the old paintings. Trace of three such pilasters were to be seen on the north side and one on the south. At the same time some casual mutilation was caused by the erection of mural tablets. There had also been a perceptible amount of wilful scratching, which he imagined had been done when the paintings were still fully visible.

The lecturer said he had been asked to discuss what relation the paintings bore to stained glass, in which they were specially interested, and to other forms of art used at the time. In general lay-out they could be said to remind them of stained glass pictures. The scenes were set in an architectural frame which simulated stonework. Some of the scenes themselves, especially those which had the darkest background, reminded them of bas-relief. Others, especially those for the south wall, recalled, accidentally perhaps, but strongly, faded tapestries.

The sculpture illusion, so to call it, was equally perceptible in the slightly later and distinctly inferior series of paintings in the Lady Chapel at Winchester, in which most of the Eton subjects recurred.

The lecturer further said that the specimens gave some idea as to the relation between the wall-paintings and the book illustration of the time. It was obvious, he thought, that most of the paintings could be reduced without injury to the scale of the miniature. It was possibly true that if he told them that the miniatures, as they saw them enlarged on the screen, were copies of wall paintings, they would not find it surprising.

Therefore, he thought that the paintings had affinities with sculpture and book illustration, and perhaps tapestry.

In the discussion that followed, Professor Lethaby spoke of the great beauty of the paintings, and admitted that he had heard for the first time from the lecturer the suggestion that they aimed at imitating sculpture, a suggestion with which he agreed. He referred to the recent discovery in Westminster Abbey of some paintings which would also seem to simulate sculptured work.

Mr. Anning Bell followed, and said he hesitated to express an opinion as to the nationality of the artists, but thought their work showed distinct Flemish influence. He was curious to know in what medium the pictures were painted, and suggested that the main outlines were probably traced, as in the case of a wall painting of about 1510 or 1520, parts of which remained in Carpenters' Hall, London.

Mr. Tristram, whose copies of some of the paintings were exhibited, explained that his drawings were half size.

Sir Cecil Harcourt Smith spoke of the aims of the British Society of Master Glasspainters, and the necessity of securing records of existing old stained glass. The museum had many, but the Society wished to acquire complete records of old stained glass in this country, and to be the central depository, as it were, of such information. He asked all those who could help in this matter by reports to the Society to do so. He referred to a suggestion made recently that the Eton paintings and the design for the Fairford windows were by the same hand.

Dr. James, in replying, said he did not consider the Fairford theory correct.

The meeting closed with a unanimous vote of thanks to Dr. James and to Sir Cecil Smith for extending the hospitality of the Museum to the Society.

A YEAR BOOK FOR THE CONCRETE INDUSTRY.

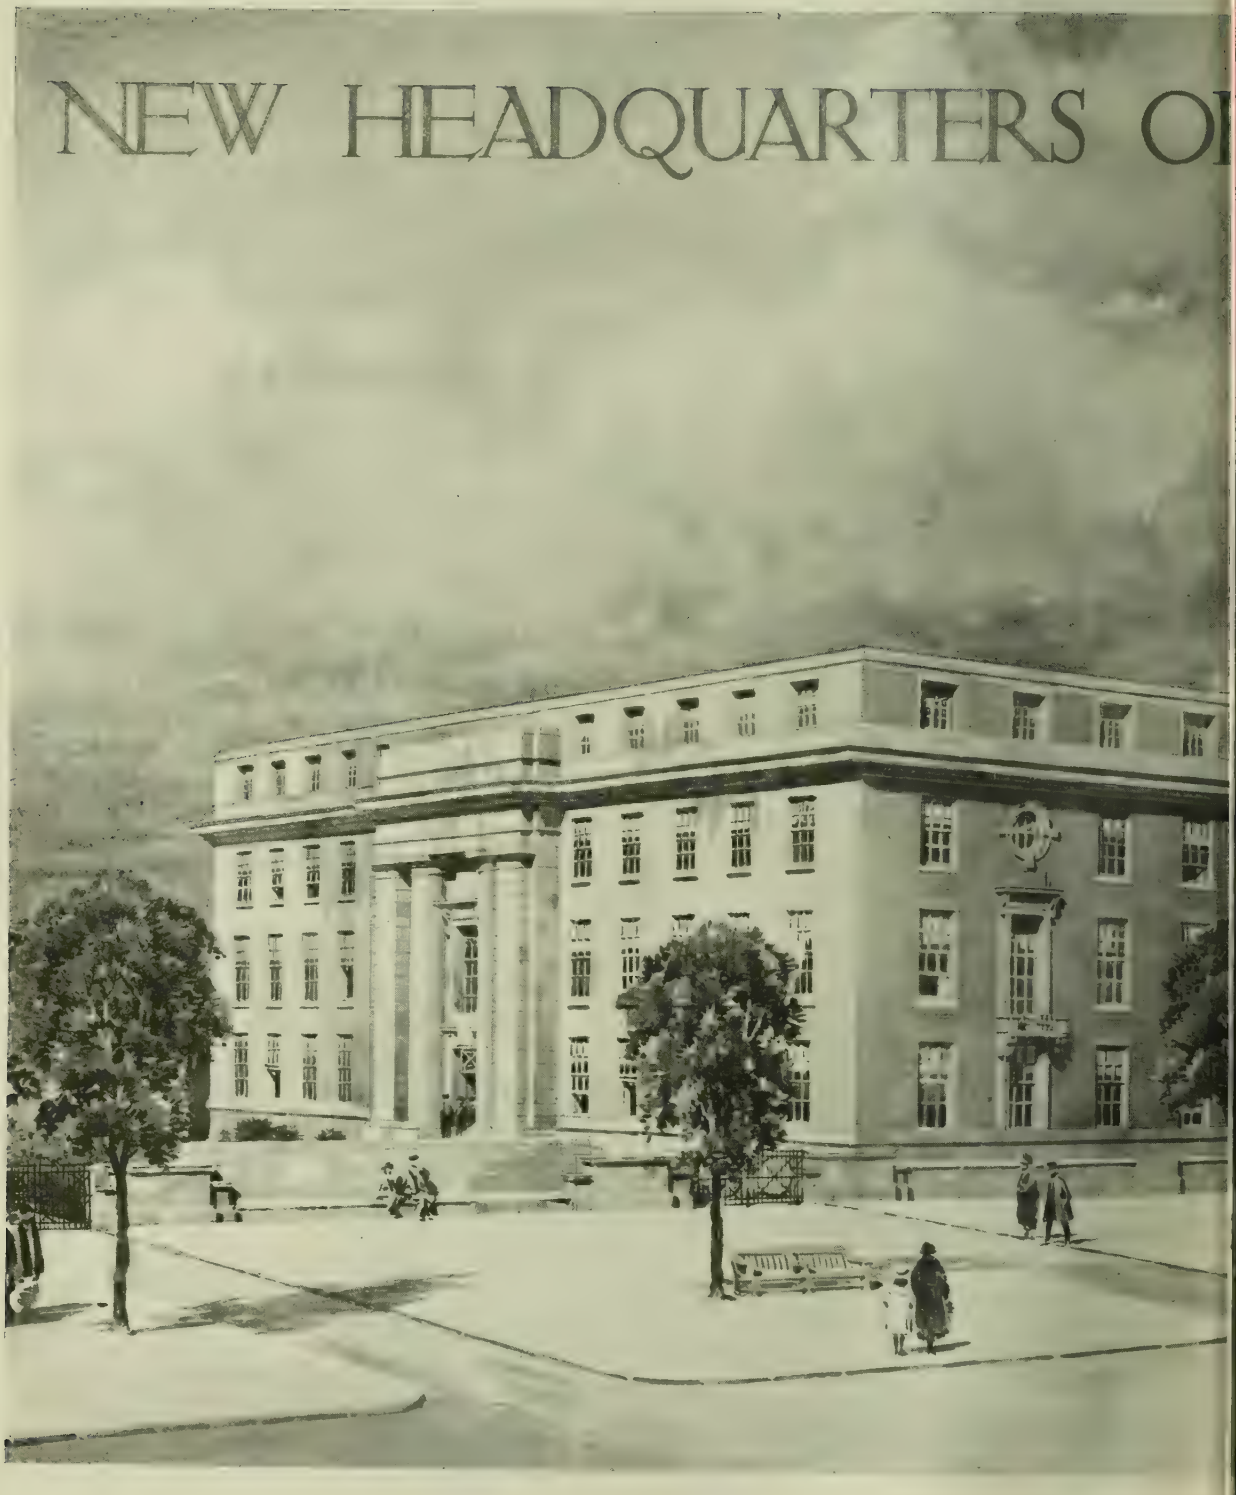
AMONG the important industries of the country the concrete industry has hitherto stood alone in having neither a handbook nor a directory prepared specially for its use, and it is to fill this gap that the "Concrete Year Book, 1924," edited by Oscar Faber, O.B.E., D.Sc., and H. L. Childe, has been prepared. The book includes (1) a Handbook in which much useful information is given on practical applications of concrete and reinforced concrete, (2) a Directory, and (3) a Catalogue of the industry. In the Handbook section the Editors have endeavoured to present methods essential for the production of the best and, at the same time, the cheapest concrete in a form which will be readily understood by everyone connected with the industry. The book throughout is written in simple language, and by following the principles and rules given anyone should be able to make a good concrete at no more cost than a poor one. Chapters are given on proportioning and grading aggregates to secure the best results, concreting in cold weather, memoranda of use in concrete work, and standard specifications for various types of floors, surface treatments, concrete roads, &c., and a series of tables for reinforced concrete design. The Directory section has been classified for ease of reference under different headings, and a departure from giving only names and addresses is made by including a full list of the manufactures and products of each firm. The Catalogue section is included to enable the users of the book to see fuller particulars of the products of different firms without the delay occasioned by writing for catalogues. The book is published at No. 4, Catherine-street, Aldwych, W.C. 2, price 2s. 6d. net (by post 3s.).

EXHIBITION NOTES.

THE LEICESTER GALLERIES.

In reply to the objection that he had seen nothing like Turner's picture in Nature, Ruskin is reported to have replied: "Don't you wish you could?" It is obvious that some people might say "No"; but, directed by moral comment and criticism, the general public would, perhaps, hardly dare to say "No." But if they were asked whether they could wish to be able to see "things" like those depicted by Van Gogh, and shown in the Leicester Galleries, we believe the public would have the courage to say "No." Whistler was accused of throwing a paint pot in the face of the public, but was he ever so daring as modern painters; and was not there always some enchantment about his hue and colour?

ROAD MAKING.



A LECTURE on road making was given at the College of Estate Management, recently, by Col. C. H. Bressey, O.B.E., of the Ministry of Transport. The lecturer described the statutory powers under which highway authorities could construct roads; few roads were, however, made by local authorities prior to the war, practically all construction being done by owners developing estates. The growing needs of modern traffic and the problem of dealing with unemployment had brought about a need of new construction, and the limited powers of the public authorities had been greatly increased by the Development and Road Improvement Funds Act, 1909, and the Unemployment Relief Works Act, 1918. He described the new construction now in progress and in view in the London area, and illustrated this by means of maps and drawings. He emphasised the need of an ample width between hedges, so as to provide for future widening at a minimum of cost, and to enable sewers and mains to be laid in the grass verges when they were needed. The extra cost involved by the purchase of this extra land was not great, but he admitted that the maintenance of the roadside wastes might be a problem for the highway authorities. The Liverpool to Manchester new road was also illustrated. This was 150 ft. between hedges and contained two 30 ft. carriageways and a separate tramway track on sleepers in grass. Many County Councils were adopting 60 ft. for the width of important roads between towns through populated country, this being made up of a 30 ft. carriageway with a 7 ft. verge and 8 ft. footpath on each side.

THE BUILDING TRADE.

ESTIMATING FOR SMALL BUILDERS.—XI.

By J. H. BARNS, F.I.O.B.

PLASTERER.

THERE are very many kinds of materials used for plastering to walls and ceilings, and the cheapest and a very satisfactory method is the ordinary lime and hair plastering. In this case, it is usual to mix the lime in a tub and run it through a sieve; add the hair (which is usually cow hair), and thoroughly mix the material, and let it rest for about a month to thoroughly cool down. The proportion of sand to mix with the plastering will depend on the specification, probably two parts sand to one part of lime, or three and one are the most usual.

The first two coats would be composed of the material mixed in the proportion of say, three and one, and the last coat would be the setting stuff, which would be mainly composed of lime and called "putty." The amount of hair used will depend upon the description in the specification, which is usually 1 lb. hair to 3 ft. cube of sand. Hair costs 16s. to 20s. per cwt., according to length of hair.

Some kinds of vegetable grasses are sometimes used for this purpose, but they are not in general vogue.

The quantity of lime required will in a measure depend upon the amount of core or insoluble material present in the lime. Lime is a very inconvenient material to store, as it rapidly deteriorates, but when run into putty it will remain usable for a very long period. In cold weather it is economical to gauge a small portion of plaster with the setting coat, as it causes the material to go off more quickly and thus assists the free working and economical completion of the work. If ordinary lime and hair plastering is done well, it is probably one of the best of all plastering materials. When lime is run into putty it rather increases in bulk.

A comparatively recent introduction is "Calime," which is a pre-hydrated lime supplied in powder form. This seems to possess many good qualities, and probably the chief advantage to the small builder is the fact that it saves all the sloppy mess of running putty, as a little powdered lime can be taken on to the job in a sack and there mixed with the necessary water as required.

A rough and ready test of the class of workmanship in plastering is to put a straight-edge or plumb rule against it. The quantity of materials required will depend upon the thickness of the plastering. If the plastering were 1 in. thick it would, of course, equal one-thirty-sixth cubic yard for each yard super, and for lesser thicknesses in proportion. Allowance should be made for diminution in bulk similar to that mentioned for concrete, &c., where an allowance is necessary for mixing and ramming, but in the case of plastering the diminution in bulk will be consequent upon mixing and consolidation by floating. Three-quarters-of-an-in. thick will be sufficient for render, float and set, but this may be governed by the thickness of grounds or linings to walls. If the materials have to be hoisted to the top of a high building this will increase the cost of labour.

The irregularities of the brickwork may either increase or decrease the quantity of material required for plastering, but as a rule unless the brickwork is well built with square bricks, such as Flettons, the irregularities in the brickwork will increase the quantity of materials required by 10 per cent. The waste of material due to droppings is about 5 per cent.

It is sometimes specified where the brickwork is to be erected in Flettons that the internal walls which have to be plastered must be built of grooved Flettons, and it would be a convenient way to price the additional cost of these bricks in the plastering item. The additional cost of grooved Flettons is about 2s. per thousand, or about 1¼d. per yard. The groove in the Flettons would require more plastering material, and probably 2½ per cent. would be sufficient.

Example:—

Materials for 100 yards super of render, float and set (3 and 1).	£	s.	d.
2 yds. sand, 14s. per yd.	1	8	0
1¾ or 2 yds. lime, 25s. 6d. per yd., say	2	4	7½
18 lbs. hair, 20s. cwt.		3	3
Use of 14 sacks, 3d. each		3	6
For 100 yds. super	3	19	4½
For 1 yd. super			9½

To which must be added the additional cost (if any) due to factors mentioned above.

The cost of labour for render, float and set would vary from 1s. 2d. to 1s. 8d. per yard super, and this would include for the labour in erecting the usual trestle (split head) scaffold, which would be sufficient for ceilings up to 12 ft. high. For heights over this it is usual to erect scaffold with poles, &c., the extra cost of which is worth from ½d. to 2d. per yard, or more, in accordance with the height and length of time required.

Example:—

	s.	d.
— Yds. super render, float, and set.		
Materials		10
Labour	1	6
Use of scaffolding, say		1
	2	5
Profits and oncosts, 15 per cent. ..		4½
	2	9½

RENDER FLOAT AND SET IN NARROW FACES.

This is for plastering to isolated faces and it is hardly possible to give a price for this as the cost of plastering a strip 4 in. wide would be about the same as for a similar strip 6 in. wide. Further there is very little of this item in the average building, and 50 per cent. added to the labour stated above should be ample.

RENDER AND SET.

This is done in cheap kinds of work. The pricking up and floating are done in one coat, and the setting completes the operation. The work would finish about ¼ in. thick. There is accordingly less labour and material.

Example:—

	s.	d.
Materials		8
Labour	1	2
Scaffolding, say		1
	1	11
Profit and oncosts, 15 per cent.		3½
	2	2½

— Ft. run labour arris would cost about 2d. per ft.

— Ft. run labour quirk. This might be described as a slight chamfer on the plastering up against a wood lining or other finishing, and is worth about 1½d. per ft.

LATH, PLASTER, FLOAT AND SET.

It would cost about 5 per cent. more for the labour and 10 per cent. on materials for plaster ing on lath work, to which must be added the cost of lathing.

Example:—

— Yds. super lathing with sawn lath plastering, floating and setting to ceilings.

	s.	d.
1 yd. sawn lathing fixed ..	1	0
1 yd. plastering materials ..		11
Labour	1	7
Scaffolding, say		1
	3	7
Profit and oncosts, 15 per cent.		6½
	4	1½

— Yds. super render and float in Portland cement and sand mixed in the proportion 1 to 3.

Materials.	£	s.	d.
1 1–20 tons cement, at 60s... ..	3	3	0
Use of 12 sacks, at 3d.		3	0
3 yds. sand, at 14s.	2	2	0
	£5	8	0
Add for diminution in bulk, &c., 15 per cent.		16	2½
	3)£6	4	2½
Cost per yd. cube	£2	1	5
" " super 1 in. thick ..		1	2
" " " ¾ in. " ..			10
" " " ⅝ in. " ..			9
Materials for above, say, ¼ in. thick..			10
Labour, 1s. 6d. to 2s. per yd., say,		1	9
		2	7
Profit and oncosts, 15 per cent. ..			4½
		2	11½

— Yds. super screed to floors ¾ in. thick in Portland cement mixed in the proportion of 3 and 1.

	s.	d.
Materials		10
Labour, 1s. 3d. to 1s. 9d., say ..	1	6
	2	4
Profit and oncosts, 15 per cent. ..		4½
	2	8½

— Yds. super screed to floors 1 in. thick, &c., all as last.

	s.	d.
Materials	1	2
Labour, 1s. 4d. to 1s. 10d., say ..	1	7
	2	9
Profit and oncosts		5
	3	2

KEENE'S CEMENT.

There are three different kinds of Keene's cement, viz., pink, white and fine, and the prices are about 110s., 115s., and 185s. per ton respectively, sacks charged at 1s. 9d. each, and credited at 1s. 6d. each.

The quality of the cement varies considerably, as some are much freer working than others.

An easy working cement will go on the cement ground like butter, but a difficult working cement would need a plasterer with a literary touch to do full justice to it—the cement seems to go on in waves and would probably cost 25 per cent. additional for labour. Like many other things, the cheapest cement is not necessarily the most economical. It is not usual to buy Keene's cement in larger quantities than can be speedily consumed, as it deteriorates if kept in stock. The retail prices charged for small quantities are much higher than those quoted above, being about 7s. per bushel, cartage extra. Keene's cement is usually finished on a Portland-cement rendering as backing, thus forming probably the best wall plastering. It is capable of very high finish by trowelling, &c., and can be faced up to imitate marble.

Sometimes Keene's cement plain face is executed on a backing of Keene's cement and

sand. Keene's cement is usually treated when wet with a coat of paint, which is usually measured separately.

Yds. sup. Keene's cement plain face on Portland-cement backing :—

Materials for ⅝ in. backing Keene's cement, 1 bushel to 7 yds. sup.	1s. 0d.	9d. per yd. sup. ,,
	1s. 9d.	
Labour, say	2s. 0d.	,,
	3s. 9d.	,,
Profit and oncosts, 15 per cent	7d.	,,
	4s. 4d.	,,

The labour for similar work in narrow widths would cost about 50 per cent. more :—

—Ft. run Keene's cement (angle & arris)—(usually about 4 in. girt).

Materials	1½d.
Labour, say	3d.
	4½d.
Profit and oncosts, 15 per c.	1d.
	5½d.

Labour to slightly rounded angle (being run with a mold), would cost about the same as the square angle :—

SIRAPITE.

Will take to cover 120 yds. super. about—

	£	s.	d.
2 yds. sand, at 14s. per ton	1	8	0
15 cwt. coarse Sirapite, at 70s. per ton	2	12	6
5 cwt. fine ditto, at 78s. per ton	0	19	6
Use of sacks	0	2	6
For 120 yds. super.	£5	2	6
For 1 yd. super. for materials, say		10¼d.	

Labour is worth a little more, say 10 per cent., than ordinary render float and set.

Sirapite is frequently used as the work can be followed on quickly.

It is usually finished to a less thickness than common plastering.

A little lime putty is sometimes used in the finishing coat. Care must be taken in using this and other patent plasters, as if any small particles of these cements get mixed with concrete or mortar it will expand and blow off the face.

PLASTER MOULDED CORNICE.

The cost will vary considerably as more material will be required for a projecting cornice than for one worked to a coved detail.

The labour for 6 in. and upwards in girt would cost about 1s. 8d. per foot super and for smaller mouldings add 25 to 50 per cent. for labour.

Example :—

— Ft. super plaster moulded cornice.

	s.	d.
Lime, putty and plaster, say		4
Labour (including proportion cost of zinc mould and horsing), 1s. 4d. 2s. per ft. super, say	1	8
	2	0
Profit and oncosts, 15 per cent. ..		3½
	2	3½

Therefore—	Per ft. run. s.	d.
12 in. plaster moulded cornice.. ..	2	3½
9 in. plaster moulded cornice.. ..	1	8
6 in. plaster moulded cornice.. ..	1	1½

Mitres priced as 1 ft. run.
Stopped ends as ½ ft. run.
Returned mitred ends as 1½ ft. run.

Generally one-half of the mitre can be run with the rule and the other worked in afterwards.

SMALL AREAS OR REPAIRS TO PLASTERING.

These are mostly charged for as day work and cannot be measured and valued at anything like the rates before mentioned.

JOINTLESS FLOORING.

Jointless flooring is manufactured from a variety of materials consisting of a filler and cement. The filler is either asbestos, cork, or wood flour. One of these fillers is mixed with magnesium chloride and magnesium cement and colouring matter, and laid as floor.

If laid in one coat work and wax polished the cost would be 5s. 3d. per yard for 500 yards and upwards. For lesser quantities the price would be higher.

If laid in two-coat work about ¾ in. thick, the price would be 1s. 3d. per yard more, or 6s. 6d. per yard for 500 yards and up.

In two-coat work the looser material is at the bottom and the closer material at the top.

It is considered that if jointless flooring is laid on concrete, two-coat work will be required, because the bottom layer must be in a measure resilient to take up vibration and forms a cushion between the sub-floor and the hard-wearing surface of the jointless floor.

The skirtings are usually worked as a cove. The price would be, for 2 in., about 4d. ; 3 in., 5d. ; 4 in., 6d. per ft. run.

LAW REPORT.

By-laws Prosecution.

THREE cases in regard to local building by-laws occupied the whole day at the sitting of the Wimbledon Justices on November 15, when Mr. John Sydney Brocklesby, architect, of Kingston-road, Merton, Surrey, was summoned by the Merton and Morden Urban Council for three contraventions of the Council's by-laws during the erection of a house, "Flint Barn," Mostyn-road, Merton.

Mr. E. J. Naldrett, instructed by Mr. C. J. Mountifield (Clerk to the Council), appeared for the prosecution, and Mr. W. E. Watson, F.R.I.B.A., instructed by Messrs. Wilde, Wigston & Sapte, was counsel for the defence.

The first summons raised the question of whether pipes of No. 2 quality could be used for soil drainage purposes. The by-law stated : "Every person . . . shall, in the construction of every drain of such building intended to be used for conveying sewage use good sound pipes formed of glazed stoneware, heavy cast iron, or equally suitable material."

Mr. Jerram, Surveyor to the Council, stated he found defendant making use of No. 2 quality, or black band pipes, in part of the soil drains. He wrote to defendant stating that 1st quality pipes only must be used. He had not had a previous experience of black band pipes being used for soil drains. In cross-examination he said it was about 1912 that firms began to indicate 2nd quality pipes by putting a black band on them. The difference in price between the two classes of pipes was about 15 per cent.

Mr. Watson : Before the black band was used you might have had many 2nd quality pipes used ?—I cannot say that.

Mr. R. Marsden, surveyor's assistant, corroborated, adding that some 1st quality pipes were used.

Messrs. Greives, Jeffs & Mather, surveyors to the surrounding authorities, deposed that their Councils acted under similar by-laws and would not allow 2nd quality pipes to be used for soil drains.

Mr. C. A. Freemantle, of Messrs. Doultons, Ltd., attended on subpœna, and stated that black bands were put on pipes first in 1912, in order to denote that they had not come out of the furnace in such a perfect condition as No. 1 quality pipes.

Mr. Wm. Golding, defendant's foreman, who was called for the defence, said he had never before had any complaints as to the pipes he had put in for Mr. Brocklesby. He selected the pipes used from a large stock, and, as instructed only used the very best, and tested each one. He would not say all had a good glaze ; some might be a little dull.

Mr. R. J. Thomson, architect, said he had inspected and tested the drain and it was perfectly sound.

Mr. W. L. Davidge, formerly housing commissioner for the Greater London area, said he had that week submitted the drain to a twenty-five minutes water test and was satisfied that good sound pipes had been used. In cross-examination, he agreed that it was more satisfactory to use 1st quality pipes, but he had no hesitation in saying that in this case the drain had been constructed in compliance with the by-laws.

Mr. Watson submitted that the sole point to be decided was, not whether any of the pipes were with or without black bands, but whether the pipes used were "good sound pipes formed of glazed stoneware." He further intimated that his client had volunteered to submit this matter to the arbitration of the Ministry of Health, in furtherance to the findings of the Departmental Committee of Building By-laws, published in 1918.

The Justices, after private consultation, stated : "We have come to the conclusion that the Council has not established its case that this drain is not made of good sound pipes of glazed stoneware."

The second summons was under a by-law stating : "He (person erecting a new building) shall cause such floor to be properly and sufficiently supported. In the case of a framed floor or of a floor formed with beams at short distances apart, and covered with battens, deals or planks, without joists, the several timbers of such floor shall be of such size or strength as may be adequate to secure due stability." Here it was contended that the timber used (elm) was not of sufficient strength, the joists being laid so that the weight was taken on the narrower dimension of the timbers. The result was that the floor (bedroom) sagged in the centre and the furniture rocked. For the defence it was denied that the results alleged existed, and evidence was given of eight men marking time on the middle joist. An invitation was given to the Justices to view the building, but they declined on the ground that they must decide according to the evidence put before them, and not according to their own opinion of the structure. A number of expert witnesses was called by both sides as to whether the erection was substantial or not.

The Justices said it was difficult for them to decide as the evidence was most contradictory, but in their opinion the Council had got the best in this case, and the Bench must decide in its favour. A fine of 40s. was imposed.

The third summons related to the plugging between the elm boards of the ground floor. The by-law stated : ". . . Shall cause the boards, planks or wood blocks to be properly tarred or creosoted on the underside or otherwise similarly treated, or to be laid on a sufficient thickness of mineral bitumen or similar material. He shall cause such boards, planks or wood blocks to be so laid and jointed as effectually to prevent any moisture from penetrating between the joints and between the underside of such boards, planks or wood blocks and the surface of the concrete or similar foundation. He shall cause every block or plug of wood used in the construction of such floor and laid in the concrete or other similar foundation to be properly tarred or creosoted, or otherwise similarly treated." For the Council it was contended that the planks of the floor were not plugged, that there were openings through which water such as would be used in scrubbing the floor might soak. For the defence there was in court a large model showing the entire section of the floor, and the method adopted to prevent damp rising. The Council did not contend that the danger was from damp rising but from damp going down between the floor-boards.

The bench suggested that the Council might see its way to withdraw this third summons, but Mr. Naldrett said he was without any such authority and must ask for the decision of the Bench.

Mr. Watson intimated that his client also pressed for a judicial decision.

By agreement each side consented to call only one witness, and the Justices, without retiring, decided to convict, inflicting a fine of 20s.

The question of costs in all three cases had been deferred until the three summonses had been heard. Their worships ordered that each side should pay its own costs. Mr. Watson then intimated that in respect of the last two summonses his client would appeal.

COVENANTS AGAINST SUB-LETTING.

IN our Legal Section, December 28, 1923, we noted a case, Terrell *v.* Chatterton (1923, A.C. 578), in which the House of Lords had held that there had been a breach of covenant not to assign or sublet the premises without the consent of the landlord where two assignments or sublettings had taken place, the one with consent but the second without consent, because the effect of the two transactions had been that the defendant had parted with the whole of the premises.

These covenants have to be interpreted strictly, and a decision of the Court of Appeal, delivered since the above decision of the House of Lords, in the case Roberts *v.* Enlayde, Ltd. (*Weekly Notes*, December 15, 1923), will serve to illustrate this.

In 1913 the plaintiff, Miss Roberts, had demised to one Burton certain land, with the factory, sheds, and buildings thereon, for a term of 48½ years, and by the lease Burton had covenanted that he, his executors, administrators, and assigns would not "assign, demise, underlet, or otherwise part with the possession of the said premises (otherwise than by will) for all or any part of the term hereby granted, without the consent in writing of the lessor, her executors, etc., first had and obtained," but there was a proviso that this clause should not apply to any underletting of the said premises or any part thereof for a term not exceeding three years.

Burton had assigned this lease with the plaintiff's consent to the defendants in this action in 1915, and on August 13, 1921, the defendants had sublet part of the premises—that is to say, a cottage, shed, and yard—to one Turnpenny, on a weekly tenancy without the lessor's consent, and subsequently had underlet the whole of the remainder of the premises to a firm, Woolnough, Ltd., for 21 years from December 25, 1920, also without consent.

The action was to recover possession for breach of covenant, and the Court below, on the authority of the decision in Terrell *v.* Chatterton, had held the claim succeeded, but the Court of Appeal have now set aside this judgment, holding that the subletting to Woolnough, Ltd., was not a breach of the covenant because it was not a subletting of the whole of the premises (see the cases cited to that effect in our note to Terrell *v.* Chatterton, December 28), and the subletting to Turnpenny was not a breach because, being for a term less than for three years, it came within the proviso in the lease excepting it from the covenant, and thus, although the sublettings did in fact constitute a subletting of the whole of the premises, the case was distinguished from Terrell *v.* Chatterton.

The judge in the Court below had held that the case was analogous to Chatterton's case, because there part of the subletting was lawful, being made with consent, whilst here the same reasoning applied to the subletting for less than three years—at least, that is how we understand the short note of the case at present available; it must be said that the distinction between the two cases appears a very narrow one, but perhaps when the case is fully reported in the *Law Reports* the distinction may be clearer. All that we can suggest at present is that in the case we are considering, by the proviso a lawful subletting *of part* of the premises was permitted, whereas in Chatterton's case the covenant applied to the premises as a whole, and therefore in that case the two separate sublettings resulted in a letting of the whole premises in breach of that covenant, whereas here one subletting was expressly permitted by the covenant, and the second subletting was the only one which could be questioned, and under the cases we have referred to a subletting of part of the premises is not a breach of covenant not to sublet unless it is specially prohibited by the covenant.

RATES OF WAGES IN THE BUILDING TRADE.

The following are the rates of wages in the building trade in England and Wales. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

	Masons.	Bricklayers.	C'p'ters. Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Labourers.

For rates of wages in the Building Trade in Scotland, see page 33.

CONTRACTS, COMPETITIONS, &c.

For some contracts still open, but not included in this List, see previous issues. Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, &c., may be obtained.

BUILDING AND PAINTING.

★JANUARY 5.—**Coulsdon and Purley.**—COTTAGES.—Erection of 52 cottages at Godstone-road, Kenley, for the Coulsdon and Purley Urban District Council. Mr. R. Chart, Surveyor to the Council, Council Offices, Purley. Deposit £5.

TRURO.—Plans passed by T.C.: Messrs. Walter Hicks & Co., rebuilding of "William IV" Inn, Kerwyn-street; Mr. W. Hitchens, house.

TURTON.—The D.C. are seeking sanction to borrow £9,000 to carry out improvements at the Eagley sewage works.

UCKFIELD.—Plans passed by U.D.C.: Mr. C. H. Pelham, six cottages, Vernon-road; Messrs. Powell & Co., cottage in Hampstead-road, for Mr. D. Beale.

WAKEFIELD.—The City Council are making application to the M.H. for sanction to borrow £20,000 for the purposes of providing houses for the constabulary.

WALLASEY.—Plans passed by T.C.: House, 5, Highacre-road, for Mr. D. Lyon; two houses, Radley-road, for Messrs. Jones & Glenn; three garages, 19, Rice-lane, for Mrs. E. Graham; cook-house, 399, Poulton-road, for Messrs. Hill & Co.; six lock-up garages, Grosvenor-road, for Mr. William Broster; 14 houses, St. George's Park, for Messrs. Tate, Pumford & Doughty; two houses, Monmouth-road, for Mr. A. Macdonald.

WARDLE.—The D.C. have purchased land in Birch-road required for widening purposes, which is to be carried out on the road beginning near Hesketh, continuing to Birch-hill Institution.

WATERGATE.—The Priestman Collieries, Ltd., have submitted to the Whickham U.D.C. a lay-out of approximately 33 acres, providing for 407 houses, or 12 to the acre; the site being bounded by Brown-lane and Washingwell-lane on the west and east, and by South Field Farm on the south. The difficulty in respect to the Watergate scheme was one of drainage, and also of access. The Council approved the new scheme conditionally. It was stated that about 1,000 houses in all would probably be built.

WATFORD.—Plans passed by T.C.: Detached house, Cambridge-crescent, for Mrs. Durrant; factory premises, Cassiobury Mills, St. Albans-road, for Petroflex Tubing Co.; eight houses, Whippendell-road, for Sun Engraving Co.; bungalow, Cedar-road, for Mr. W. Marshall; extension to north end of Ward Block, Vicarage-road, for Watford Board of Guardians; new classroom, "Gartlett," Clarendon-road, for the Misses Goadby; detached house, Bucks-avenue, for Mr. P. Figg; six dwelling-houses, Sandringham-road, for Miss L. M. Godman; five lock-up garages, Lower Derby-road, for Mr. A. Linley.

WEST RIDING OF YORKSHIRE.—The Standing Joint Committee is asking for sanction to expend £20,000 for the erection of houses for the police.

WHARFEDALE.—An estate at Hawkesworth, is to be opened out for building purposes. The estate has been sub-divided into plots of 1,000 super yds. each, and several of these have already passed into the hands of prospective builders.

WIGAN.—The B.C. confirmed a resolution passed approving of a scheme for developing the estate in Wigan-lane purchased from the executors of the late Mr. H. S. Woodcock, by erecting thereon a number of differently graded houses, the plots for the same being open to purchase by those desirous of owning their own houses. The sites at Ridyard-street, Pemberton, and at Bottling Wood were also under consideration.

WILLESDEN.—Plans passed by U.D.C.: Eight houses, Herbert-gardens, Harlesden, by Mr. A. Welford, for Messrs. Jermey & Son; 18 houses, Sneyd-road, Cricklewood, by Mr. W. J. King, for Mr. A. C. Derham; 7 houses, St. Michael's-road, Cricklewood, by Messrs. Done, Hunter & Co., for Mr. A. G. E. Barnes; 6 houses, Doyle-gardens and Herbert-gardens, Harlesden, for George Ball (Willesden), Ltd.

WINDLESHAM.—The U.D.C. have obtained the sanction of the M. of H. to the borrowing of a further sum of £11,120 for the purpose of completing the Bagshot, Lightwater and Windlesham sewerage and sewage disposal works. The consulting engineer for the scheme is Major T. J. Moss-Flower, chartered civil engineer.

WREXHAM.—Plans have been passed by the T.C. for 18 houses in Bryncabanau-road in three blocks, for General Lloyd; six houses in Rivulet-road, and three in Derby-road, for Messrs. T. Hughes & Co., Rivulet-road; and two houses in Barnfield, for Mr. T. Owen Jones. All these houses will be eligible for the Council's subsidy of £100 per house.

YEADON.—A lay-out plan of an estate at White Cross has been approved by the U.D.C., after having been prepared by Mr. Crabtree. It is proposed to develop the estate and erect semi-detached and bungalow type houses thereon; the estate comprises some 60 acres.

FIRES.

BURTON-ON-TRENT.—Damage to the extent of over £5,000 has been caused by a fire at the flour mills of Messrs. Cooper & Sons, at Acresford.

CHELTENHAM.—The premises of Messrs. F. W. Hinton & Sons, fruit merchants, have been destroyed by fire.

CWMCARN (MON).—The Working Men's Institute, Cwmcarn, has been completely destroyed by fire outbreak.

DARVEL.—A serious fire has occurred in the factory of Messrs. Cleland, Bros. & Co., lace manufacturers.

EDINBURGH.—Great damage has been done by fire to the biscuit factory of R. Middlemass & Son, 137, Causewayside.

FIRE AT LADIES' COLLEGE.—A big fire occurred at St. Elphin's Ladies' Training College, at Warrington, recently, the centre portion of the building being gutted, and damage caused to the extent of £20,000.

RUTHERGLEN.—A serious fire has occurred at the works of the Caledonian Pottery Co., Rutherglen.

WHITLEY BAY.—The Pavilion picture house and adjoining property has been destroyed by fire.

Fire.

On December 24 a serious fire broke out in the works of the Caledonian Pottery Company, Ltd., situated at Farmeloan-road, Rutherglen. The damage has not been estimated, but is believed to be nearly £20,000. Fully 100 workers will be thrown out of employment.

THE SCOTTISH BUILDER

NEW BUILDINGS IN SCOTLAND.

Glasgow.—VARIOUS.—John Emery & Son, contractors, 175, West George-street, to erect 33 two-story five-apartment terrace houses at Muirend-road, Muirend; James Watson, builder, 494, Crow-road, Jordanhill, to erect double villa at Cornwall-avenue, Victoria Park, Partick; John Arbuckle, 147, Howard-street, to erect a house at Langlands-road, Newlands; Corporation Electricity Department, to erect an electricity sub-station at Burgher-street, Parkhead; Corporation Parks Department, to erect a bowling and tennis pavilion at Auldhouse Park; William Findlay, 56, Laverock-street, Springburn, to build a bungalow at Auchinairn-road.

Aberdeen.—HALL.—Lord and Lady Cowdray have given £20,000 for the proposed Cowdray Hall and Art Museum. A start has been made with the work, which involves the extension of the gallery and provision of a war memorial court at a total estimated cost of £60,000.

Cathcart.—HOUSES.—The Upper District Committee of the Renfrewshire County Council have passed plans for the following:—40 houses at Ormonde-avenue, Muirend, for John Dicke & Sons, builders, and 30 cottages at Netherlee, for A. Mitchell & Sons, Ltd., builders.

Clarkston.—HOUSES.—The following plans have been passed by the Upper District Committee of the Renfrewshire C.C.:—Bungalow, Carolside-avenue, Clarkston, for Mr. J. McCallum, builder; cottage, Kilmarnock-road, Newton Mearns, for Mr. R. Carswell, Eaglesham; and bungalow at Southfield-avenue, Potterhill, Paisley, for Mr. D. Ralph.

Errol.—POLICE STATION.—The Perth C.C. proposes to erect a police station at Errol.

Saltcoats.—HOUSES.—The T.C. has conditionally approved plans for six flats at Ardrossan-road, and an office and house at Springvale-place, for the Ayrshire C.C.

Giffnock.—BUNGALOWS.—The Upper District Committee of the Renfrewshire C.C. has passed the following plans:—Bungalow at Busby-road, for the Southern Building Co., 480, Pollokshaws-road, Glasgow; two bungalows, Percy-drive, for Mr. Philip Thomasson, builder, Motherwell; and bungalow on the Davieland Estate, for Mr. J. Mackie, Pollokshields.

Edinburgh.—VARIOUS.—The Finance Committee of the Edinburgh Provincial Committee for the Training of Teachers has agreed to ask the Housing Committee to make a recommendation in favour of the provision of additional hostel accommodation at Craigmillar Park for women students.—The Dean of Guild Court has passed the following plans:—Mrs. M. Donald, villa at Queensferry-road, Davidson's Mains; A. Forbes, two bungalows at Drylaw-avenue, Blackhall; A. S. Gray, villa at Woodhall-road and Fernlie-avenue, Colinton; T. Scoon, bungalow at Dovecot-road, Corstorphine; D. Shepherd, house at Saughton-road, Corstorphine; Wood's Bottle Works, workshops at Barleyfield-road, Portobello; and S. Keppie, jun., two houses and garage at Lasswade-road, Liberton.

Gamrie.—Mr. Charles Fordyce has offered £5,000 in aid of a nursing scheme for the parish. Mr. Fordyce suggested the erection of a small cottage hospital at an estimated expenditure of £4,000, and the investment of £1,000 for endowment purposes.

JANUARY 4.—**Brechin.**—HOUSES.—Erection of four four-apartment houses, type B1, to be erected at Trinity-road, Brechin, for T.C. All particulars from Mr. D. W. Galloway, architect, 2, Market-street, Brechin. Deposit £1 1s.

JANUARY 22.—**Edinburgh.**—HOUSES.—The Board of Agriculture for Scotland intimates that tenders have to be invited by smallholders for various works in connection with erection of two houses, one house on Kerrycrusach Farm, County of Bute, 2¼ miles from Rothesay; the other on Goltans Farm, County of Bute, 2 miles from Rothesay. Plans at Employment Exchange, Rothesay. All particulars from Chief Surveyor to the Board. Deposit £1 1s.

Gospel Pictures in Mosaics.

A series of mosaics has been dedicated at St. Columba's Church of Scotland, Pont-street, London, by the minister, Dr. Fleming. The mosaics are the anonymous gift of "a loyal member of the congregation, to the glory of God and in grateful memory of a beloved mother and sister."

The mosaics occupy seven Gothic panels, which extend completely across the back of the chancel. Six of them depict the life of Christ on earth, the subjects being the Nativity, the Baptism, the Agony, the Crucifixion, the Resurrection, and the Ascension. The seventh represents the Descent of the Holy Spirit.

Housing Progress in Scotland.

The following figures show the progress that has been made in State-aided housing schemes in Scotland to November 30, 1923:—

Permanent houses completed ..	20,123
Temporary houses completed.. ..	665
Reconstructed houses completed ..	101
Houses completed under the private subsidy scheme	2,314
	23,203

There are 2,930 houses at present under construction in connection with housing schemes carried out by local authorities and public utility societies.

The total amount paid by the Scottish Board of Health in respect of the 2,314 houses completed under the private subsidy scheme is £549,126 13s. 4d.

Glasgow Theatre.

There is a prospect of a definite step being taken in the near future to provide for the erection in the city of an up-to-date hall capable of seating about 1,200 for dramatic productions primarily. The hall, it is contemplated, should be adaptable for chamber concerts and musical recitals. The question of the provision of a larger hall for grand opera and concert purposes is still under consideration.

BUILDING TRADE WAGES IN SCOTLAND.*

THE following are the present rates of wages in the building trade in the principal towns of Scotland. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

	Masons.	Bricklayers.	Carpenters, Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Brick-layers' Labourers.	Masons' Labourers.	Plasterers' Labourers.
Aberdeen	1/7	1/8	1/7	1/8	1/7	1/7	1/4½	1/-		
Airdrie	1/7	1/7	1/7	1/8	1/7	1/7	1/6½	1/2½		
Alexandria	1/7	1/7	1/7	1/8	1/7	1/7	1/6½	1/2		
Arbroath	1/7	1/6	1/6	1/7	1/6	1/6	1/5	1/1		
Ayr	1/7	1/7	1/7	1/8	1/7	1/7	1/6½	1/2½

* These prices apply to *new buildings only*. They cover superintendence by foreman and carry a profit of 10 % on the prime cost without establishment charges. A percentage of 1½ should be added for Employers' Liability and National Health and Unemployment Acts and from 1s. 6d. per £100 for Fire Insurance. The whole of the information given on this page is copyright.

PATENTS.*

APPLICATIONS PUBLISHED.*

204,144.—S. F. Sutherland: Collapsible folding boxes.

204,178.—T. Hulse: Means for securing door-knobs to their spindles.

204,210.—C. G. Mitchell: Wall ventilators.

204,224.—G. Jaeger: Water-tanks for concrete-mixing machines.

204,225.—Twyfords, Ltd., and J. T. Webster: Lavatory basins and sinks.

204,233.—C. T. S. Hammond: Fires, fireplaces, stoves, and ranges.

204,235.—B. I. Hellyer and R. H. Hellyer: Flushing cisterns.

204,256.—J. Winks: Preparation for disinfecting and restoring the surface of stone or plaster made as an imitation of stone.

204,263.—J. E. Abrams: Building-blocks.

204,269.—W. L. Ross: Portable buildings.

204,275.—W. H. Miller: Tools or appliances for scraping plaster work.

183,477.—G. M. Gouyaud: Method of constructing arches of reinforced concrete without using any moulds, arched falseworks or scaffoldings.

195,952.—J. L. L. A. A. Moulet: Pipe coupling.

200,031.—M. Palanti: Blocks for building and general construction purposes.

200,077.—J. Bonnet: Automatically-operated jack for use in underpinning.

202,324.—P. Liese: Grid windows.

204,785.—G. H. Cliff: Combined convertible ladder and step-ladder.

204,791.—E. R. Calthrop: Machines for manufacturing compound veneer or plywood.

204,828.—I. Bloomenfeld: Chest of drawers.

204,894.—J. E. Kennedy: Crushing apparatus.

204,896.—H. Baker: Wire fencing.

204,935.—C. F. Bennett: Ovens or kilns for firing pottery and other ware.

204,940.—J. A. Webberley and J. Adams & Son, Ltd.: Door springs.

204,944.—G. D. Hepburn and Butters Bros. & Co.: Derrick cranes.

204,947.—S. J. Cadwell: Means for opening and closing fanlights, greenhouse, and other hinged windows.

204,971.—W. Bachmann: Carpenters' and like joints.

204,987.—J. Heys: Devices for opening box-lids.

204,989.—Grigg Motor & Engineering Co., Ltd. (H. Grigg and H. Grigg): Folding stools.

204,999.—Anker Heegaard Aktieselskabet (A. Paulsen and J. P. Moller): Fire-places.

205,019.—K. F. Krauter: Building of floors.

205,149.—S. Woodall: Method of construction in crates, boxes, and the like, to render them collapsible and self-fitting.

205,151.—H. A. Lamplugh: Seats.

205,158.—C. F. Rainsford: Boxes, packing-cases, and the like.

205,172.—D. De Nagy: Jigging or shaking machines for moulds, particularly applicable to moulds for moulding concrete blocks, slabs, and tiles.

205,204.—E. Law: Concrete wall construction.

205,221.—G. H. S. Carter: Perforated bricks or gratings used for ventilating buildings.

205,235.—M. Jones: Single sash window-holder.

205,262.—H. O. Weller: Rain- and water-proof distempers and water paints.

205,263.—J. A. Davidson: Manufacture of concrete pipes.

205,272.—J. A. Husbands and H. A. Brett: Disinfecting apparatus for use in flushing cisterns.

205,305.—A. G. Sadler: Construction of theatre chairs.

205,337.—Parker, Winder & Achurch, Ltd., and J. A. Wood: Casement hinges.

205,338.—J. Christie and A. R. Lang: Form for moulding concrete structures.

* All these applications are now in the stage in which opposition to the grant of Patents upon them may be made.

Wort & Way, Salisbury	16,897	0	0
Collins & Son, Salisbury	16,700	0	0
Building & Public Works Construction Co., Ltd., Swindon	15,899	0	0
*Porter, Jenkins & Williams, Salisbury	16,300	0	0

SOUTH STAFFORDSHIRE.—Construction of reinforced concrete filtration and sedimentation tanks in Birmingham district for the South Staffordshire Water Works Co.:—

*Grays Ferro-Concrete Co., Glasgow £23,249

STIRLING.—Erection of houses on south side of Broad-street, for the T.C.:—

*Gardners, Stirling £2,624

STRETFORD.—For provision of two shale tennis courts, each at Longford, Victoria and Gorse Hill Parks, for the U.D.C.:—

*G. Clarke & Son £499

Wireless Station.

Messrs. Chessums, Ltd., Imperial Works, Portland-road, N.15, are erecting, near Rugby, a Post Office Wireless Station for H.M.O.W., under the superintending architect, in connection with the Wireless Imperial Chain.

Reinforced Concrete.

Messrs. Saxild & Partners, reinforced concrete specialists, of No. 2, Central Buildings, Westminster, S.W.1, have issued a new catalogue, in which are illustrated a number of interesting reinforced concrete structures which they have carried out, including jetties and quay walls, slipways, foundations, bridges, breakwaters, power stations, grain silos, oil storage depots, seaplane hangars, workshops, factories' granaries, office buildings, &c. The interest of the catalogue (which comprises 64 pp.) is enhanced by the inclusion of plans and sections of many of the buildings, which show the application of several methods of design not generally adopted in this country.

THE BUILDER

A JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR.

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

VOL. CXXVI.—No. 4223. JANUARY 11, 1924.

STATE CRAFT AND BUILDING CRAFT.

ARCHITECTURE, as we know, is a flower that grows on the surface of civilisation. It is, perhaps, a by-product rather than a product. At the risk of being accused of calling it a weed instead of a garden plant, we might assure ourselves that its free growth is spontaneous rather than forced; that a fine civilisation gives off fine architecture not as the product of effort but as the inevitable and healthy result of activities which, in the main, are directed to other ends. After all, we recognise that there are in the world of natural beauty wild plants as beautiful as the trained; so let us call it a by-product, realising that wild or cultured—spontaneous or trained—the flower owes its life and its beauty to the soil.

And for architecture the soil is civilisation, the life of ordered society, the State. How strange is this reflection at a time like the present! How much more solid in those last days of 1923 seemed the purpose, the progress, and the performance of architecture than that vortex of upheaval which has been racking the bases of our State. These disturbances are, it may be, much more apparent than real. There may be—we believe there is—that in the unwritten constitution of England and in its traditions of government which rises above and is anchored beneath all battles of party against party. It is happier to believe in and to trust this hidden and majestic force than to analyse it, for there is in the minds of those who think deeply of such matters a lurking fear lest this hidden deity, if hunted home and revealed, should prove to be nothing more than the deeply reverenced law that under a competent chairman fifty-one men can rule the destinies of any hundred of which they form a part. The fact, of course, is that all civilisations are games played under fixed rules. We say "games" not as implying anything childish or frivolous, for there is nothing less frivolous or childish in this world than British cricket. The laws of any State—that is, the constitutional laws—which may be no more than unwritten customs, are the framework of that implied contract between citizen and citizen which—unless cancelled by revolution, makes the State a State. And even revolution, its object once achieved, has a tendency to build its new structure, if it builds at all, on the old foundations and around the old framework. These traditional bonds are the laws of the game to which as citizens, anxious to keep our country free from civil tumult, we owe, and rightly owe, the homage of patriots. This is why a strain on those rules however apparently ridiculous is indeed no laughing matter.

This is no political journal: we are not talking politics; we are merely gazing, as every man and every architect must gaze, on the unusual spectacle of an unusual fact. It is experiences such as this which make us wonder at the strange inadequacy of the constitutional machine and make us further, while wondering, admire. For indeed we can trust, for all our amazement, and in our trust we can realise that England's strange elastic strength is equal to every emergency. Sooner or later, probably very soon, the crisis of threefold division will resolve itself into the old accustomed fight of one against one—a fight which is all the friendlier because of its antiquity. England then will settle down to plainer issues.

Meanwhile, the great cranes swing the great blocks from street level to sky line, and architecture, crippled though she is by the astounding phenomenon of a grim shortage of men, which stalks through the land arm in arm with hideous unemployment, architecture, the ancient and sublime, goes on her majestic way. But she goes in fear; for if the State is crippled she falls. If the fair field of her growth is sterilised she fades.

How little people think on the nature of civilisation. The sound man broods little on the nature of health, and citizens in the sound commonwealth give little heed to the conditions out of which a commonwealth is built.

The wisest folk will often think and utter the strangest thoughts about the nature of social existence and social growth. For example, war—the strife between nation and nation—has been sometimes spoken of as a relapse into barbarism. War is a horrible and detestable thing; but the more horrible it is and the more detestable the less can we afford to overlook the undoubted fact that so far from its being a return to man's state before civilisation, it is in fact with all its vileness a product of a very high order of State culture. Personal attack by man against man, individual against individual, may be, it is true, a return to savagery, but war itself, unless manœuvred by irresponsible autocrats, is the action of a civilisation not indeed primitive, but so organised and developed that its citizens prefer to undergo the risk of the gravest personal injuries rather than jeopardise the State to which they owe a sacred allegiance. That war will be in the near future superseded in practical world politics by reasonable international arrangements for the settlement of disputes is the earnest wish and prayer of more thoughtful statesmen; but those who condemn it as an evidence of insufficient civilisation misunderstand not only the facts of history but the logic of State-growth.

But to return to architecture and the realm. Which is the more important to humanity, the art of architecture or the craft of State management? The latter, obviously, for without an ordered State an architectural life would be impossible. But how bewildering is the thought that the preparation for State control in our rulers is infinitely slighter than the pains bestowed on the training of a young architect; and how entirely absent in the case of England's controllers are the safeguards with which we preserve architecture from the danger of untrained practitioners. We need a Socrates who, by homely questions and trenchant answers, should reveal the absurdity of the actual condition.

It is sometimes said that the great safeguard of England's rule lies in the permanent officials of the government offices; in other words, that no matter who come and go as nominal rulers, their actions can only take effect through trained professional administrators. This line of comfort may perhaps be sound. An architect friend of ours once saw in this a parallel. Ministers of the Crown are, he said, in the same position towards statecraft as are clients towards architecture. Architects, he said, are set in motion by clients, persons who may or may not have architectural taste. It rests with the guardians of the art to see that client's orders never result in outrages against its canons. The parallel may be sound. Who knows?

With these thoughts we go forth into the New Year, if full of anxiety, at least full of hope, for without hope neither architecture nor statesmanship can succeed. And we trust that our readers, be they architects or voters, or both, will find in the coming twelve months the rewards of sound statesmanship and pure art; that the soil in which our craft alone can flourish may be well tilled and produce not only the flowers of architecture, but those still greater fruits, "peace and happiness, truth and justice, religion and piety."

NOTES.

R.S.A. Architectural President.

Another indication that architecture is coming more into its own may be found in the election of Mr. George Washington Browne to the Presidentship of the Royal Scottish Academy. Nobody can possibly wish to dethrone the art of painting pictures from its great position in the life of the world, for it has had a valuable interest as an educational refinement, but the function of architectural art so combines all other arts, both on the practical and artistic sides, that architects may be pardoned if they consider an architect as peculiarly fitted for such an office as president of a painting body. Mr. Washington Browne has long since won his spurs as a particularly able architect and he has outstanding merit as an artist. We congratulate him and also the Academy on his election.

Individuality.

We often wonder how much or how little the average man realises the value of individuality. Yet it would be a terrible world if we were all cut out to an exact pattern, and if we consider it we shall find that it is less the nearness to perfection which we learn to regard in an individual than the little lapses from the perfect form, or action, or thought. We even come to like the individuality of a trick or halt in speech or movement. Therefore it would seem that individuality is a value in life which we all appreciate. And when we leave our own country we feel one of the outstanding interests is of other lands and peoples.* It is well, therefore, to remember that our British characteristics, which have grown into being through our climate, environment, and habits, have a definite value which it may not be wise to eliminate.

*In this issue we commence a series of articles by Mr. Theodore Fyfe on the value of travel.

English Architecture.

The above note leads us to some remarks on Major Corlette's admirable paper on "English Architecture," which he read before the Manchester Society of Architects—in which he dwells on the value of our national characteristics. As to how far it is well to try to alter our national character and mould it into an international type there may be varying opinions, but if variety is one of the undoubted charms of life it may be well to preserve as far as possible our national characteristics as well as those of a more specially individual character. There surely can be no two opinions as to what our average modern architecture is reflecting of any peculiarly British feeling; there is little enough to be found. Yet the development of Gothic art found a ready response amongst the British people, and beautiful and wonderful as French Gothic is at its best we all know that the specially British characteristics brought qualities to Gothic art which gave it a world-wide distinction. Now, since our national individuality seems to have found little or no expression since about Sir Christopher Wren's time, we have been floundering along midst copyism and revival until we have reached all sorts of modern eclecticism which is practically devoid of any national individuality. When order and character have evolved out of the present chaos will it show our well-defined English characteristics?

English Character.

What is English architecture? We are glad that Major Corlette took English architecture as the subject of his address, and we hope what he had to say will bear some fruit. After our fifty years' trial in this country to infuse fresh interest in our modern work by revivals of every known style, both English and foreign, we have been settled down for a time into a general adoption of a muddled sort of Renaissance which is perhaps as little English as it can well be. We quote the following from Major Corlette:—"The Italian revival in Italy was a revival of a native and a Latin tradition. The introduction first of Italian detail and decoration and then of Italian, and, later, of Greek, form as well as detail into England and other northern countries was not revival. It was not a return to but it was a destruction of, and a break from, English tradition. And however much we may have learnt, and may still learn, from the many beauties of detail and of form Italian work possesses, it will never become a truly national tradition acceptable to and welcomed by a Gothic race. It does not appeal to their native instincts or to their inborn feeling. It is a culture, a southern plant in a northern soil. And it will never really thrive without a large variation and free handling that may make it conform to native ideas and national needs."

Oneself.

We would appeal to all our architectural students who really love their art to be true to their instincts and seek to do what they can find pleasure in the doing. We do not for a moment suggest they should ignore the value of study and comparison; it is possible that the more they know about the world-wide refinements of architectural art the better equipped they will be, but they should refuse to be entangled in the meshes of an art that may be dead to them, but follow that admirable advice to be true to themselves. Our architecture cannot be good unless we understand the values of sound construction, fine proportion, and beautiful detail, and these may be obtained in any school and any style, but the vital matter lies in the designer who, because he has something in him worthy of expression, refuses merely to follow the lead of others, whether they be school or university professors or anyone who can pose or talk of art out of a dull and uninspiring mind.

Fellowship.

We all realise the value of the advice, "Man, know thyself," though we may much doubt whether the average man often achieves that knowledge. But do we realise as we ought the value of knowing our fellows? We have often thought that the "At Homes" at the Institute might have led to a further development of this excellent social function. If the bulk of the pleasant talk which architects had with each other on these occasions was less of architecture than anything else, was not a more happy feeling of fellowship promoted, and did it not help the realisation that even a fellow

Detail of Carving.
Cambridge University: School of Bio-Chemisty.
Sir Edwin Cooper, F.R.I.B.A., Architect.
(*See p.* 52.)

competitor in the realms of art might be a very good fellow and help to lighten a little the dark shadows that cross our lives and professions. We had an intimate talk with a young architect the other day which seemed to us to throw a flood of daylight about things which interested him most, such as the eternal competition question and the grotesque distribution of honours, and the varying degrees of efficiency amongst fellow architects—nice, straight talk with no obscurity of views.

The Disfigurement of London Buildings.

In reference to the letter which appeared on this subject in our issue of January 4, we have obtained the views of one or two well-known architects on the matter. Professor A. E. Richardson said that Mr. Belcher's Institute of Chartered Accountants was one of the most interesting examples of pre-war buildings in the City, and had the merit of expressing its character as an Institute. It seemed pitiful that the work of an artist should be disfigured by impertinent additions, which might remedy smoky chimneys, but spoiled the silhouette. People were very sensitive on these matters, and again their first impression of a building was from the skyline. There were other ways of curing a smoky chimney than by adopting cowls and tall-boys. Modern practice in the City aimed at the abolition of numbers of flues and the installation of a system of central heating; and it was to be hoped that the future would see a lessening of the number of chimney-pots. Finally, why not consult the architect?

Tidying up London.

Another architect expressed the view that the disfigurement of buildings was not confined to London alone. In fact, in Italy they had a saying that no one looked beyond the cornice line, because on the tops of beautiful palaces they had tanks, pipes and all sorts of excrescences. Unfortunately the particular disfigurement of the Institute of Chartered Accountants was not the only form of disfigurement that spoiled London buildings. At Aldwych, looking towards Bush House, there was a glaring disfigurement in the form of an electric light standard. Taking a wider view, the misplacement of call-boxes, sand-bins, and the erection of kiosks all had their deleterious effect. He suggested that there should be a competition for students in order to find out the best method of tidying up London. It would be a better training than working at monuments and palaces which had not the slightest chance of erection. It would enable them to handle the small, practical things with which architects had to deal.

The Jury System.

Is the system of arriving at a decision in a competition by allotting marks for certain qualities a sound one? In any case, when it comes to allotting marks for draughtsmanship the system gets out of hand. What draughtsmanship has to do with the award we fail to see, except that an architect who will not, or cannot, make a good representation of his design might, with certain assessors, lose some sympathetic consideration. The arguments which may be advanced on the various aspects of competitions seem endless. On the face of it we might fairly claim that the competitors themselves are the best judges and probably the really able competitors are, but in a contest where a hundred or more take part it is doubtful whether the majority would take a sound view.

Developments in Builders' Plant.

On another page we print the first of a series of articles under the general title of "Modern Builders' Machinery." These articles have been specially written for *The Builder*, their object being to discuss the great developments that have taken place in the plant available for the very varied requirements of the builder and contractor, and the results that are to be obtained by the use of it if judiciously selected and properly handled. The subject is of peculiar interest at the present day because, owing to the severe and protracted restrictions imposed on the building industry by the post-war policy of the Government, it is only now that that industry may be said to be able to revert to what we hope will be normal conditions. Hitherto, that is to say since 1914, there has been but little incentive or opportunity for the builder to give close attention to the advances made in this direction. In the frenzied construction that took place during the war, he

Silver Statuette, "Bhanavar."

By ALEXANDER FISHER.

could take only what he could get in the way of equipment, and since then and until recently it has been difficult for him to formulate a future policy of working, as he could not estimate with accuracy what was likely to be the permanent position of his industry or of himself.

Developments in Builders' Machinery.

DURING those ten years of abnormality the developments in builders' machinery have been very considerable, and it is our purpose to go fully into this question in these articles. There is a great deal of machinery available to-day which had not been dreamed of in the philosophy of the trade twenty, fifteen, and even ten years ago; and the whole routine of saw and cutter maintenance has been revolutionised. Thus, the big builder may more than double the output of his sawing and multiply that of his planing machines by four or five, as compared with pre-war practice, and without increasing his labour. He may virtually eliminate the hand-finishing of his woodwork, whether it is a question of scraping, sandpapering or polishing. He may plane his flooring after it is laid in position with as little effort, and as rapidly, as a gardener can mow a lawn; and he may even establish a sawmill inside a big building under construction and shift it from floor to floor as the work progresses with but little cost or inconvenience. While the man in a small way may not be able to avail himself of all the above advantages, he is proportionately a greater beneficiary under the modern developments than the larger builder. The machines now available for him have been greatly improved and, above all, simplified, and the advent of the electrical drive has widened his horizon immensely. This has rendered it possible for the builder of very small means to invoke the aid of machinery long before he would have been able to think of it when faced with the initial necessity of purchasing an engine, boiler and shafting, and of finding the labour, fuel and space for working them. All these and many other matters will be dealt with in this series of articles, and we invite those of our readers who are interested in this important subject to give their views and to raise any points on which they may desire either information or advice. Such communications should take the form of "Letters to the Editor," either for publication or not at his discretion.

Waterloo Bridge.

IT is rather wide of the mark to say that "the only person to bethink himself of Waterloo Bridge appears to have been Mr. H. V. Lanchester," for a good deal of thought has been bestowed upon it by others, and suggestions for duplicating have been made. But Mr. Lanchester's plan for a twin bridge crossing the river in an axial line from the west end of St. Clement Danes to the junction of Stamford street and Cornwall-road has points in its favour, both for convenience and appearance, and would for a time lessen one of our worst congestions of traffic. It surely is about time that the whole problem of cross-river traffic was seriously taken in hand. Piece-meal work, however good, is not a substitute for the broader issues. Mr. Lanchester's admirable drawings of the bridge in *Architecture* must lead to some pertinent and active consideration.

A Christmas Card.

THE Christmas Card is still with us, and one can hardly doubt its value as an easy and pleasant means of expressing one's kindly remembrance to each other, whilst it has provided an outlet for a good deal of genuine artistic skill and a somewhat valuable industry. The bulk of designs are poor enough, but many are quite delightful and admirably produced. We have designs of an architectural character published from time to time, and the newly-created home often makes a pleasant and appropriate subject of special interest. Of this kind we publish an example to-day of the recently completed Gatehouse for Mr. Reginald Hanbury, which performs the double function of a lodge and a guesthouse, making a picturesque roadside feature.

An Architectural Christmas Card, 1923: The Gatehouse, Foxbury, Woldingham.

PROBLEMS OF 1924.

IT is impossible to deal with the prospects before the building industry for the coming year without touching on political issues, and we, therefore, intend to examine impartially the probable trend of events in so far as they may affect building. The building industry, as a whole, is obviously dependent upon the state of trade, and this in turn is based upon confidence at home and abroad. No Government can fail to address itself first and foremost to the problem of a general European settlement, and if this could be found we should enter into a period of expanding activity that would quickly influence every industry, including our own. Lack of confidence is holding up a vast amount of work that would be released the moment stable conditions in Europe were secured, and from the pronouncements of responsible leaders we believe that the foreign policy of the new Government, whatever complexion it may be, will be wise and constructive, while the suggested personnel of the Reparations Commission in itself justifies hope.

If there is already, from various causes, a greater sense of confidence in respect to European affairs, there is undoubtedly a lack of faith at home, although trade normally is looking up and unemployment slowly decreasing. Nervousness concerning affairs at home is indicated by the fall of the pound sterling, a general interruption of new industrial enterprise, and the holding over of factory building. While the threats of the more irresponsible among Labour extremists are undoubtedly to blame for this minor panic, yet we consider that even more disastrous is the unpatriotic and foolish attitude of those reactionaries who gleefully regard the experiment of a Labour Government as a means of providing so much rope wherewith Labour may hang itself. We hope, and believe, that a Labour Government not only would refrain from hanging itself, but would on the contrary welcome the opportunity of proving that it was not a "class" Government but one dependent, as every Government must be, on the suffrage, goodwill, and confidence of the people as a whole. With Socialism, in so far as it implies State ownership and control, we have little in common, but that the wider social spirit which places public interest before private advantage will be stimulated by the present change we think probable, if not certain. The stumbling block will be finance, and the future danger the promise of tantalising legislation to catch votes.

The particular "Labour Government" with which we may now be confronted must, of course, be dependent upon outside co-operation in the House itself, and it will, therefore, be unable to carry through legislation of a contentious character; we are, therefore, not likely to find a further definite attempt at State housing; indeed, it is not probable that, were a Labour Government in full power, it would attempt a housing programme without making every endeavour to secure the active and willing participation of the house builder. The operation of the Housing Act of 1923 will almost certainly be extended, but with, it is to be hoped, important statutory limitations as to the density of houses eligible for the subsidy.

A Labour Government would start with the initial advantage that it would not be regarded with suspicion by the trade unions, and, consequently, it should be able to arrive at some satisfactory arrangement as to dilution, one that will remove the very real dread of future unemployment. Mr. Kirkwood has already definitely ranged himself on the side of dilution, and this, with an increase in skilled labour and a proper system of apprenticeship, are necessities. There are two aspects to the housing problem: that of housing the population generally, and that of slum clearance. As to the latter there can be no disputing that private enterprise is unable to cope with it, and we hope that our next Government, by wise and fearless handling, will succeed in substituting useful reconstructive work for the distribution of immense sums in doles, which are universally admitted to be both degrading and demoralising. We have continually emphasised the wickedness and waste involved in spending vast sums of money on building hospitals, asylums, and prisons to deal with the wreckage resulting from our failure to deal with slums.

The new Government might well interest itself in securing the country against a repetition of the erection of dark houses. This can only be done by amending the Public Health Act of 1875 and insisting upon the provision of adequate light to each room used for human habitation. It is not too much to say that had light been included as well as air in that Act, and had the provision of this necessity been enforced, our towns would be almost unrecognisable to-day, and the tables of diseases would have been materially lower for the past forty years. It would be the blindest folly for Conservative extremists to resist such an amendment, since it is the fear that private enterprise might revert to building the dark house that spurs so many to reject private enterprise altogether.

Granting a general stability, we ought this year to see a real increase in the provision of the "middle-class" house at an economic rent, but the "working-class" house is still bound to be dependent upon either a subsidy or a measure of philanthropy or both. A certain resentment is naturally engendered by the word "philanthropy," but this need, in fact, be no more than a recognition by the individual that he owes a duty to the community, and even the problem of the working-class house could be largely solved locally by the formation of public utility societies among people really interested who would be prepared to make some sacrifice to see unsatisfactory local conditions remedied. The sacrifice might take the form of giving land at a low price, of giving time or advice gratis, or of lending money at a low rate of interest. Such a demonstration of public conscience, if sufficiently widespread, might well remove the apparent necessity for direct State interference in a business which the State is not really capable of carrying out cheaply and efficiently, and would mean an immense saving to the national exchequer. But Labour itself must recognise that every citizen owes a duty as well as possesses "rights"; and the tendency of the local demagogue to snub or cold-shoulder the efforts of others on his behalf will, we hope, be discouraged by Labour leaders at headquarters.

One of the factors that has arrested building is the fear that at any moment labour and materials may be artificially diverted from so-called luxury building, and a further source of trouble is the constant interference by trade unions who attempt to dictate as to whose job it is to do this or that regardless of who, in fact, is capable of doing it; such an attitude embodies the negation of progress and reflects the "caste work" system of the Indian compound. Whereas the attitude towards luxury building is an affair of Labour policy generally, the personal interference is, as a rule, the result of small local tyrannies which must be seriously checked from headquarters if real labour grievances are to hold public sympathy.

It is to be hoped that during the coming year co-operation between architect and builder in small house design will be extended, and that a high standard generally will be maintained. Private enterprise is on trial, and if it should fail to justify itself by not producing the best work, even though it produces the greatest quantity, it will, without doubt, eventually go by the board. One can assert with confidence that we are unlikely to witness any lowering of standard in local authorities' schemes, and it will be in comparison with these that the results of private enterprise will be judged. While we have no fears of the work being carried out by the more enthusiastic members of the National Federation of House Builders, we, as champions of private enterprise, fully realise that it is by its least efficient result that the principle will be judged, and the National Federation will, we are sure, not fail to realise this.

In respect to larger houses, the servant shortage and the consequent necessity for eliminating unnecessary labour will continue to act as a stimulus to economical planning, and the extra trouble that this entails will be visible in the greater care bestowed upon the elevations. This factor, together with the ever present necessity for strict economy, will keep house design along the straight road of direct self-expression and will further wean the public taste from the unwholesome condiments of 20 years ago. It is fairly certain that house design, taken as a whole, will consolidate the gains it has secured during the past three years. Nor is architecture likely to be the only art to make a distinct advance; indeed, a curious result of the turn of the political wheel will almost certainly be seen in the greater State encouragement that will be given to all the arts, since the arts have in the past been available only to the rich, and labour cannot fail to do its utmost to democratise them. Such a change can only be beneficial, provided that it contents itself with interpreting the more enlightened public opinion. Up to the present, this country has taken a mild pride in the fact that the Government has been less than almost any other in fostering the arts or even recognising them in any shape or form.

It is significant that many of the most far-reaching Acts of Parliament have found their way to the Statute Book during the tenure of office of Coalition Governments, when Bills must be as non-contentious as possible. As proof of this, we have only to cite Women's Franchise, Daylight Saving, and the Irish Treaty. Now, whatever Government may be in power, we are certainly going to have a Coalition Parliament, however much the word may be avoided. It is not hard to find a measure that public feeling would welcome from almost every quarter, and that would indirectly profoundly affect both the erection and the life of our buildings; we refer to a Bill to deal seriously and comprehensively with the whole question of smoke and air pollution. The spade work has been done by the Departmental Committee on Smoke and Noxious Vapours Abatement appointed in 1920, and ample evidence has been collected elsewhere. An Act such as this would mark a step in the progress of our civilisation that would be remembered for generations longer than any of the more vote-catching party measures.

The coming year will be the first in which town-planning schemes will really seriously affect considerations of building, and those districts concerned will be the pioneers leading the way to a system that in twenty years' time should be almost universal. In regard to the movement towards higher buildings, the arguments adduced against any serious change seem to outweigh the considerations in their favour, at least in so far as the good of the public is concerned. The increasing attention devoted to architecture in the columns of the Press and elsewhere reflect a growing public interest and appreciation; a welcome sign being the disappearance of tens of thousands of monstrous signs that for years past have blighted our towns and country villages.

We cannot do better as a New Year's resolution than determine to take an active part in stimulating a public indignation against those evils with which we are surrounded, and thus get them set right by the only agency that can effect a permanent cure.

London Omnibus Garages.

On January 9 the L.G.O.C. will open up two new garages at Barking and Sutton, providing accommodation for over 200 'buses. The garages are part of the big development scheme which the Underground have for developing their motor-bus undertakings, and have been erected at a cost of £63,000. Garages are now being erected at Bromley, Romford, and Sidcup.

GENERAL NEWS.

Professional Announcements.

Mr. Sidney Toy, A.R.I.B.A., has removed his offices to 1, Cloisters, Temple, E.C.

After December 28, the address of Mr. Evelyn Hellicar, A.R.I.B.A., will be 43, Bedford-row, W.C.1. Telephone No. : Chancery 7093.

The business partnership hitherto carried on in the name of Kennard & Kennard will cease to exist on and after January 31. From that date the partners will practise independently. Mr. J. H. Kennard, F.R.I.B.A., at No. 12, Gray's Inn-square, London, W.C.1, and Mr. Laurence Kennard, F.S.I., at No. 31, John-street, Bedford-row, London, W.C.1.

Fire.

On January 7 one of the largest fires that has occurred for some time in London broke out at Concordia Wharf, Managers-street, Coldharbour. Damage was caused to the extent of about £200,000.

Hampton Court Bridge.

The Surrey County Council reported that the County Surveyors of Surrey and Middlesex had been instructed to make a joint report as to the possibility, and the cost, of adapting Hampton Court bridge to meet the requirements of modern traffic, and also as to the desirability and the cost of a new bridge and the necessary approaches.

North Wales University Science Buildings, Bangor.

We understand from Mr. Alan Munby, F.R.I.B.A., that the announcement made some weeks ago in the public press as to the contractors for the above work now requires correction. The tenders were submitted to the North Wales Heroes Memorial Council when the lowest, that of Messrs. Trollope & Colls, was accepted by formal resolution as was reported, but before formalities could be completed Messrs. Trollope & Colls withdrew, and the work has now been placed in the hands of Messrs. John Laing & Sons, of Carlisle.

Strand Widening.

In connection with the Strand widening scheme, the part of the works which incidentally involves the widening of the Wellington-street approach to Waterloo Bridge, has been commenced. The block of shops at the corner of Wellington-street and extending along the Strand to Savoy-street, is being demolished. The Strand frontage will therefore be put back to the Savoy building line, and the Wellington-street frontage to a line with Lancaster-place—the block of buildings at the bridge end of Wellington-street. Lancaster-place stands on ground belonging to the Duchy of Lancaster, and the offices of the Duchy are still there.

Cartoon Study for West Window for the Church of the Good Shepherd, Leeds. By Mr. Reginald Hallward.

COLLEGE OF ART STUDENTS' WORK.

There ought to be a large attendance at the exhibition of work by old students of the College of Art. The proportion of good work is so large, compared with ordinary exhibitions, that a good deal of pleasure may be found in it. The fact that much of this work may have been seen before does not detract from the value of it, for it is well that we should obtain a retrospective glance and see whether we have advanced quite so nicely as we think. There are, however, works included which have been only recently done. It would take much time and space to do justice to such an excellent exhibition, and, good as it is, it might possibly have been much larger. The water-colour section is especially interesting, and sculpture is also well represented. An admirable collection of etchings and drawings include such things as the exquisite "Morning Haze," by Sir Frank Short, an admirable etching of St. Etienne by Walter M. Keesey, a beautiful plate of "College-street, York," by A. Michael Fletcher, and the "Street of the Forgotten Name," by Fred Richards. A commentary on Fame is afforded by a reference to the silent ones in the Foreword. This says: "Of the great silent army of designers and art workers who have been trained at South Kensington the world hears nothing. They are, so far as the public is concerned, the nameless ones. After having left the College what became of them, where they went, in what factories or offices they were employed, has been almost impossible to discover. Yet their works are more widely displayed than those of any other section of artists. For they, in the design of furniture, textiles, embroideries, pottery, glass, and kindred works, beautify the homes of England, and the near and far-flung countries of the Empire. But here in this Exhibition they are scantily represented for the reasons given above." The exhibition remains open until January 26.

MEETINGS.

Friday, *January* 11.

London Society.—Sir T. Chambers on "Satellite Towns." 18, John-street, W.C. 2. 5 p.m.

Monday, *January* 14.

Architectural Association.—Lecture by Professor A. E. Richardson. 7 p.m.

National Association of Master Plasterers.—Dinner. Holborn Restaurant, W.C. 1. 6.30 p.m.

Tuesday, *January* 15.

Electrical Contractors' Association.—Dinner. At Hotel Cecil. 6.30 p.m.

Wednesday, *January* 16.

L.C.C. Central School of Arts and Crafts.—Sir Banister Fletcher on "Roman Architecture." 6 p.m.

Institute of British Decorators.—Mr. W. W. Davidson on "Stencils and Their Use." At Leeds. 7.30 p.m.

Thursday, *January* 17.

Society of Antiquaries.—Mr. C. L. Kingsford, on "A London Merchant's House and Its Owners." At Burlington House, W. 1.

Edinburgh Architectural Association.—Professor Hughes on "The Grand Manner in Architecture." At 15, Rutland-square. 8 p.m.

Institution of Electrical Engineers.—Mr. B. Marryat on "Electric Passenger Lifts." 6 p.m.

COMPETITION NEWS

Cairo.

The conditions of the Cairo Law Courts Competition are not in accordance with the regulations of the R.I.B.A., and Members are advised not to take part in it.

Other Competitions.

For other competitions still open, see our last issue.

CORRESPONDENCE.

Menai Suspension Bridge.

SIR,—Are not the two County Councils concerned too precipitate in adopting the Government's proposal to replace Telford's graceful structure by a ferro-concrete bridge, subject only to a prior examination of its design ?

We know the weakness of Telford's bridge in respect of :—

(1) Insufficient consideration of wind pressure.

(2) Localisation of weight of traffic.

(3) Consequent crystallisation.

All of which can be removed by :—

(1) Light lattice girders distributing the weight on to many, instead of, as now, on to but a few of the suspension rods.

(2) By a system of cross diagonal bracing in, or under, the floor, and to the chains.

(3) By annealing.

I suggest that accurate drawings of the present bridge, together with a report of its condition and statement of the new requirements, be prepared, from which tenders for a conservative strengthening be obtained before, if at all, proceeding with the Government's drastic proposal.

Objects of beauty are too little considered.

Might not both Councils unite to stop that vandalism, the destruction of Penmaenmawr Mountain ?

Had not our principal of fifty years ago intervened the beautiful oak roof of Conway Church would have been destroyed and been replaced by an acutely pointed one of common deal.

Manchester. A. H. STOTT.

R.I.B.A. (Alfred Bossom) Travelling Studentship.

SIR,—With reference to the notice headed "R.I.B.A." on page 4 of your issue for January 4, 1924, I shall be glad if you will make it clear in your next issue that admission to the competition for the Studentship is not confined to those students of the Recognised Schools of Architecture which enjoy exemption from the R.I.B.A. Final Examination, who, after passing through the School courses, have attained the Associateship of the R.I.B.A. In addition to those students, Associates R.I.B.A. who have attended certain other schools admitted to the competition by the Board of Architectural Education, and Associates who have obtained their Associateship without attending any School of Architecture, will be eligible for admission to the competition.

May I draw your attention to the fact that the correct titles for the Studentship and Scholarships mentioned in the same paragraph are "The R.I.B.A. (Alfred Bossom) Travelling Studentship," and "The R.I.B.A. (Archibald Dawnay) Scholarships ?"

EVERARD J. HAYNES,
Secretary to the Board.

"The Disfigurement of Buildings."

SIR,—The interesting picture illustrating the letter of Mr. E. O. Parsons fairly well depicts what we see every day on the building skyline in our large cities and towns. The poor, harmless chimney might have been kept out of the landscape. It must surely have been built before the days of radiators or hot air, and have tormented some poor thin-blooded clerk person, or perhaps smoked him out, and been crowned for its sins with a zinc or metal "lum" or cowl, put on to save it from the savage and no doubt righteously angry swoop of wind from the brows of the indignant cupola. However, there is a point I would like to refer to about high and large buildings in narrow streets. Do architects or building committees ever consider for one single moment that the placing of towers, minarets and huge masses of sculptured stone above the line of projecting cornice and in beyond the façade of the building is a waste of time, money and talent, and that the average passer-by seldom ever notes them any more than he does the atrocious chimney pots, things of utility which may once in a while raise the bile of the idealist ? What about other atrocities which mar our streets—sky signs, structural ironwork, shop fronts apparently resting on sheet glass and a few bricks, with huge masses ornate but sometimes—mostly sometimes—otherwise, of stone, marble, &c., all massed indiscriminately together, false in design and taste ?

The only word that I, as a reader, can coin for such a spirit is "Bungleism," or ignorant toleration. Some of our business men need to be awakened up and told bluntly by the profession that such things can't be done as they are a crime and a sin, because they are vicious and false in principle. Just as a minister or clergyman can condemn a lie for what it is, so should our leaders in architectural thought condemn it. J. H. EDWARDS.

Architects' and Builders' Inquiry Bureau.

For "The Architects' and Builders' Inquiry Bureau," see p. 70.

Charlatans and Pests.

SIR,—The letter in your issue of December 28, 1923, is so irrational that I don't dare to assume that the writer is a mere man. I have glanced through the correspondence and gather that it was directed against charlatans, or "quacks" and pests, i.e., "anything destructive or troublesome." Ladies "who have designed houses for themselves all over the country" cannot be described as quacks *if* they designed them, though I daresay that the architects they commissioned "just to put their ideas into shape" (a phrase most of us have frequently been tortured by) might possibly have found them troublesome.

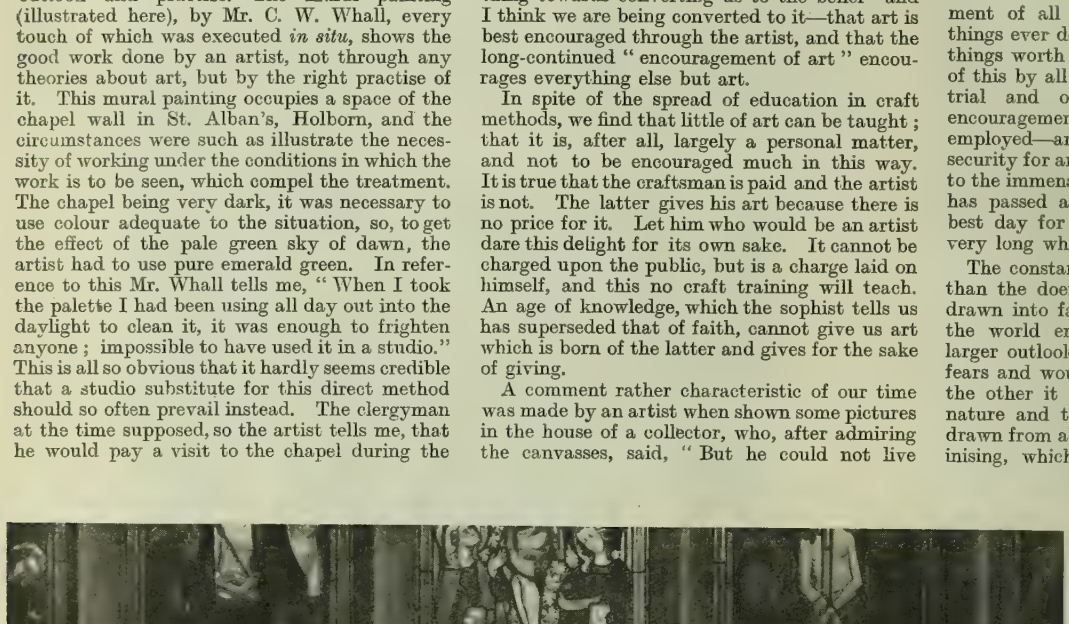
The objectionable quack is the man devoid of architectural training, and so ineligible for membership in any Architectural Society, who poses as an architect, charges fees for his faulty designs or for designs that he has misappropriated and imposes on an unsuspicious public. That he is also a pest goes without saying.

It is a trite truism to say that some doctors are better than others ; the point is that no doctor is allowed to experiment on patients until he has at least been taught his job.

With architecture this is not so, and the qualified man is bound to a standard of practice which the uneducated pirate ignores—except as a means of obtaining payment for his inadequate services. In this way the man who tacks "architect" to his other business descriptions becomes both troublesome and destructive.

Why should these quacks and pests be allowed to murder imaginative art and offend taste at every turn with their horrid experiments ? Not only men, but many women, are toiling away to graduate in a difficult profession and I venture to say that our lady architects will be equally vehement with the men in the war on quacks and pests. "INSECTICIDE."

PRINCIPLES OF MURAL PAINTING AND STAINED GLASS.



BY REGINALD HALLWARD.

ONE era succeeds to another. The ideals of one time have their period and pass, to make way for the new time which has superseded them. The emphasis changes its place, and what was first is no longer so. The difficulty always in understanding art is that so little can be taught. It is useless to gird at the commercialising of it under industrialism while we have so little understanding of its nature, and the record of three windows a week, attributed to a well-known firm of glass window manufacturers, suggests nothing to us. And it is much the same in regard to mural painting. Here and there the genuine impulse is seen quietly finding expression amid alien influences, quite contradicting all the sentimental talk about "encouragement of art," which ever finds its truest encouragement in the artist's own fidelity of outlook and practise. The mural painting (illustrated here), by Mr. C. W. Whall, every touch of which was executed *in situ*, shows the good work done by an artist, not through any theories about art, but by the right practise of it. This mural painting occupies a space of the chapel wall in St. Alban's, Holborn, and the circumstances were such as illustrate the necessity of working under the conditions in which the work is to be seen, which compel the treatment. The chapel being very dark, it was necessary to use colour adequate to the situation, so, to get the effect of the pale green sky of dawn, the artist had to use pure emerald green. In reference to this Mr. Whall tells me, "When I took the palette I had been using all day out into the daylight to clean it, it was enough to frighten anyone; impossible to have used it in a studio." This is all so obvious that it hardly seems credible that a studio substitute for this direct method should so often prevail instead. The clergyman at the time supposed, so the artist tells me, that he would pay a visit to the chapel during the progress of the work, and was quite surprised when told that he intended to paint the thing himself. How often has my own public work brought the same experience. It seems to some so much more gentlemanly to get it done by assistants, while the employer looks in once or twice in black coat and seals, "watching it go." The artist is primarily a worker, not an employer, a craftsman, not a director, and our values derived from the counting house lead us astray. That in certain of our art schools there should be a training in mural painting going on to-day, with opportunities sought for public work for the students engaged in it, work done in the wrong way in execrable materials, executed away from the actual site and under none of the conditions rightly governing such work, should do something towards converting us to the belief—and I think we are being converted to it—that art is best encouraged through the artist, and that the long-continued "encouragement of art" encourages everything else but art.

In spite of the spread of education in craft methods, we find that little of art can be taught; that it is, after all, largely a personal matter, and not to be encouraged much in this way. It is true that the craftsman is paid and the artist is not. The latter gives his art because there is no price for it. Let him who would be an artist dare this delight for its own sake. It cannot be charged upon the public, but is a charge laid on himself, and this no craft training will teach. An age of knowledge, which the sophist tells us has superseded that of faith, cannot give us art which is born of the latter and gives for the sake of giving.

A comment rather characteristic of our time was made by an artist when shown some pictures in the house of a collector, who, after admiring the canvasses, said, "But he could not live on work of this kind; I suppose he had a private income"—reminding one of that reply of the bishop when approached by a young clergyman who wanted to take up special work: "Well, have you the money for it," said the bishop, "the money will be the evidence of the call." This view that vocation cannot exercise itself without the security of private income is surprising, for not many artists are called by this reasoning. And yet it is difficult to believe that vocation and endowment hold no other security than that of money. Either there is some call higher than all this, or there is no place for the arts, for it is never worldly prosperity that most endows them. Inspiration does not seem to come that way. It is worth thinking over for all of us—worth deciding upon—for I have seen failure enough through lack of such decision. If we are but the creatures of circumstance, pawns of the counting house, and man is not master of his fate, what is the use if our heads are "bloody" as well as "bowed?" Better spend our empty days on nothing so we are paid for it. But how absurd even the statement of it sounds, containing as it does its own refutation, denying all the best achievement of all the noblest people, all the best things ever done in the world; perhaps all the things worth doing at all! I was set thinking of this by all the encouragement of art, industrial and other, that surrounds us now—encouragement of art with the best artists half employed—and I wondered when this sort of security for art on which we set so much store, to the immense insecurity of the artist himself, has passed away, whether it will not be the best day for the arts they have known for a very long while.

The constant danger is lest the talker rather than the doer become uppermost, and we get drawn into false estimations of value, such as the world endows, instead of the freer and larger outlook of the artist, which bureaucracy fears and would crush. If we mistake one for the other it bodes ill for art, which is by its nature and the compulsion of its work withdrawn from all the platform and official attitudinising, which obscures it so much. When I notice how much those who are not artists speak for art, I wonder how the public, except through its own better knowledge, can distinguish its right hand from its left in such matters. The people are none the less more capable of appreciating true values, as I have seen over and over again in the practise of my work, and it is not them but the intermediaries who intervene to darken knowledge and misdirect appreciation.

Reredos at Hillingdon Church. By Mr. JOHN D. BATTEN.

The reredos for Hillingdon Church, by Mr. John D. Batten (illustrated in this issue) is an interesting and beautiful example of one of our most scholarly and sincere artists, who has brought to his methods a knowledge and research of exceptional value and importance to the practise of art. This reredos, built mainly of walnut, occupies in elevation exactly the same space as the previous dossal, and stands wholly on the stone sill of the window, which is 15 in. deep.

The conspicuous features are a vine carved canopy, gilded and burnished, supported on four sycamore pillars with gilded caps in the spaces, behind which are three recesses, the arched tops of which are supported on smaller gilded pillars. The three lunettes are decorated with shallow carving enriched

Reredos at Hillingdon Church. By Mr. John D. Batten.

ith foil, lacquer and colour, but they only ll dimly in the dusk below the gilded nopy. The vine carving was done from Mr. atten's design, very beautifully, by William heeler, and I am glad to give some record his work in the photograph reproduced. e gilding was done by Mrs. Batten, who has astered the craft by a reverent obedience to e directions of Cennino Cennini, and it would t be too much to say that the gilding is up to e level of the finest work of the Quattrocento.

After the reredos was in place it was felt that e light from the east window on each side of e reredos was still distressing to a congregation oking towards the east, and Mr. Batten signed curtains to screen the lower portion of em. It occurred to him that leather would be suitable material, as it would not collect and ld dust. We are familiar with the achieve- ent of the Spanish leather hangings, but the tist kept purposely at a great distance from e Spanish design, though using pretty much e same means of embossing, colouring and quering. There is, however, an important fference in technique. The Spanish metal at shows like gold is always silver foil covered th a yellow lacquer, and the artist had intended t use this method, but the yellow lacquer faded hen superimposed, and he had no time for such search as could have secured a permanent sult and fell back on fine gold leaf (24 carat). l the gold in the curtains has been lacquered, d some of it coloured as well, lest it should mpete with the pure gilding of the reredos.

Much eloquence is expended on the subject of tained glass, and considerable impetus has been ven to it through the training bestowed, but is is the least part of the matter. The true actice of stained glass is no doubt found where e artist designs, executes and directs the work mself. Its fundamental requirements are not, wever, wholly included in this, but in the dowment and direct vision which inspire it. hen we speak of the more rare work of the rsonal craftsman we are not distinguishing ly between sound methods of workshop actice, which are necessarily included in the st results, but between the craftsmanship hich can be taught and the vision and treat- ent which are personal endowments of the dividual. It is because we forget this that e fail to distinguish truly. I do not know that e fostering of a certain class of craftsmanship all right of its kind—at all fosters the prospects art. Nay, it has in many ways gravely scured them. Art has to be extricated, and is, in fact, being extricated from all this sort of fostering, and reveals itself as something altogether separate and apart from the bulk of that which is now being so sedulously exploited as industrial art. The latter has its place; but if we were to suppose that this present "industrial art" movement could in any way replace or become an adequate alternative for the artist's personally endowed vision, we should be very much mistaken. "The marriage of art and mass production" is the slogan of the salesman, not the artist's vision of the conversion of the future through beauty.

Detail.

Mural Decoration, Mortuary Chapel, St. Alban's, Holborn.
By Mr. C. W. Whall.

The principles governing mural painting require that we should respect our work well enough to do it the right way and not be hirelings, embracing the obligations which its nature imposes on us, no longer lazily acquiescing in studio substitutes. And so with the art of stained glass; it is not enough that we should acquire the technical methods of its practice, but that the artist in us should be ever seeking towards new discovery and combinations, that it may not remain merely derivative, second-hand, and a survival only, but become the expression in its own way of the best experience and endowment of the artist's vision to-day. When this happy occasion arises we shall not look for an output of three windows a week as any recommendation, or for any commercial substitutes to supply for us what only the heart of the artist can give; nor shall we look upon mural painting as a resource for unemployed students aided by their professional art masters, or think that any artificial fostering will supply that which only the artist creates. It is to extricate art from all the tangle of interests, compromises and motives which beset it to-day and to restore it to its own clear and authentic purposes, that we need so much to re-state our beliefs, for it is only through clearness as to these that it can communicate its beauty and delight to the world.

The love of nature which guides the artist unfolds to him ever new revelations out of her inexhaustible treasury. How often, when we have thought to reach beauty through some preconception of our own, the sitter has taken some new position—a slight change of movement and gesture—unfolding a beauty exceeding any intention of our own. So the artist, humbled the more by what so much transcends him, yielding himself more completely to her inspiration, through service to nature and art, finds truth and beauty to be one—the interpreter of life and of all its fairest issues.

The examples illustrated comprise reference to one or two examples only which are typical of that improved temper in work which is now growing through the younger men; one which, while retaining the traditions and precedents that properly belong to all sound practice, develop an expression which is at once personal, endowed and efficient in technique.

R

THE LAW RELATING TO BUILDING.

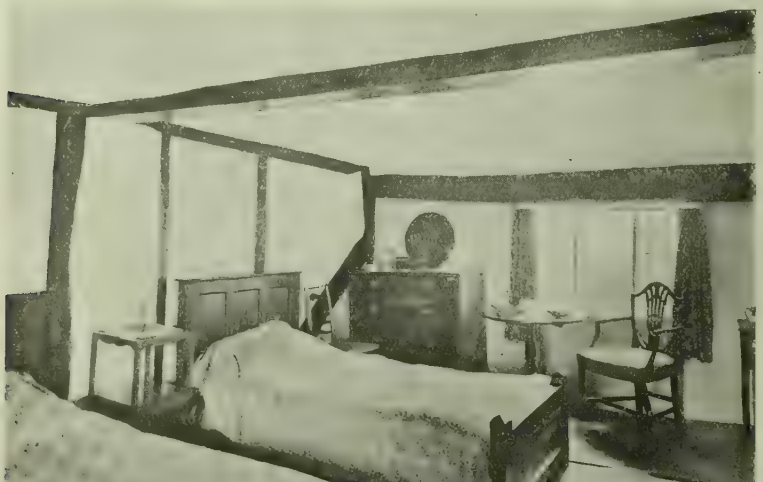
By W. T. CRESSWELL, LIC.R.I.B.A.; ASSOCIATE S.I.; F.R.S.I. (*Barrister-at-Law*).

I.—INTRODUCTORY.

THE above title is chosen to indicate the subject matter and scope of this and following articles, although, at the outset, paradoxical as it may seem, it must be stated tnat there *is* no particular law relating to building as distinct from, and beyond, the general laws relating to "agency," the rights and liabilities of architects, surveyors and others concerned with the carrying out of building works, being exactly the same as those of any "agent." The full definition of such rights and liabilities would necessitate a complete survey and résumé of the law relating to "persons."

Architects and surveyors, then, are neither protected nor harassed by any statutory rules and regulations governing the practice of their professions, their incident rights and liabilities. Those who are not members of any recognised society or institution, within the personnel of their profession, are free even from any code of professional etiquette regarding either practice or scale of fees.

It therefore follows that any private person may tout for practice as an architect or surveyor. His risk is, that if his client or employer is dissatisfied, the latter may sue him at law for negligence, incompetence and "not having used ordinary care and skill." In the case of Lanphier *v.* Phipos (1838) 8 C. and P. 475, Tindal, C.J., said: "Every person who enters a learned profession undertakes to bring to the exercise of it a reasonable degree of care and skill; he does not undertake, if he is an attorney, that at all events you shall gain the cause, nor does a surgeon undertake that he will perform a cure; nor does the latter undertake to use the highest possible degree of skill. There may be persons of higher education and greater advantages than he has; but he undertakes to bring a fair, reasonable and competent degree of skill."



In fine, the only protection and guarantee provided for the public in reference to persons functioning, or seeking to function, as architects and surveyors, are the rules and regulations of various societies and institutions which formulate codes of etiquette, scales of fees, &c. But it must be clearly understood that these rules and regulations only affect continued membership of these bodies, and that expulsion or suspension from such bodies is no disqualification against practice.

Whereas, in such professions as are "registered," *e.g.*, the legal, medical and dental, these rules and regulations are statutory, and legal powers, of varying degree, are vested in their societies and institutes. The General Medical Council may take proceedings under the Medical Acts to strike off the medical register the name of any misdemeanant. The Law Society has power to strike off the roll of solicitors any misdemeanant (appeal being permitted in the Divisional Court); and in the Benchers of each Inn of Court is vested the power to expel, and thereby disqualify for practice at the bar, any offending member. In fact, "reasonable and competent degree of skill," in a registered profession may be said to mean membership of one of its recognised societies.

In the building professions, no licence is required to practise; but if either an architect or surveyor wish to act as valuer and appraise property, real or personal, and to recover fees for this work, he must hold a licence under Section 1 of the Revenue Act (1845) and Section 6 of the Revenue (No. 2) Act (1864). Should he value or appraise without a licence, he is subject to a penalty of £50 under Section 21 of the Inland Revenue Act (1890). In Palk v. Force (1848), 12 Q.B. 666 it was held that for an appraisement or valuation, made in one single instance, the licence fees and duties *must be paid*. Under Schedule 1 of the Stamp Act (1891) "appraisements and valuations made for, and for the information of, one party only, and not being in any manner obligatory as between the parties, either by agreement or by operation of law, e.g., approximate estimates, are not liable to stamp duty nor subject to the obligation of a licence."

"A valuation" must not be confused with an "arbitration." The latter is the outcome of dispute between parties, the former is not.

Architects and surveyors are then in fact persons holding themselves out to the public to perform as agents recognised functions requiring certain skill, and they therefore hold out the implied guarantee that they possess such skill. Membership of any recognised institute or society, or even proof of any special training, is not necessary to maintain an action for the recovery of "reasonable fees. However, proof of incompetence or lack of skill will not only defeat such an action, but will also uphold a claim for damages should loss or injury result to the employer; and even, may be, a claim of criminal liability, in case of fatal accidents resulting therefrom. (These liabilities will form the subject matter of a subsequent article.)

"Ockhams," Edenbridge. A BEDROOM.
MESSRS. BAILLIE SCOTT & BERESFORD, Architects.

"Ockhams," Edenbridge. A CORRIDOR.

Qualifications.

In these allied professions, therefore, the essential and real qualifications may be summed up as follows:—

I.—*For the architect*:

(*a*) Expert knowledge of design, styles, orders, &c., and of town planning.

(*b*) Skill in the preparation of plans, drawings and designs, defining, and as a guide to the carrying out of, proposed works.

(*c*) Knowledge of construction and materials to be used, with the application and use of these materials.

(*d*) Knowledge of Building Acts and by-laws, the requirements of local authorities, sanitary laws, easements of light, air, support, &c., relating to public and private buildings.

(*e*) The preparation of approximate estimates for works proposed.

II.—*For the building surveyor*:

(*a*) Skill in measurement and survey of land and the "development" of land.

(*b*) Skill in valuing property for mortgage or other purposes.

(*c*) As (*d*) in "for the architect," above.

(*d*) An intimate knowledge of the law of dilapidations, compensations, and arbitrations.

III.—*For the quantity surveyor*:

(*a*) Expert knowledge of building construction.

(*b*) Such knowledge of the styles and orders of architecture as will enable him to describe correctly particulars and details of the works.

(*c*) As (*d*) above, "for the architect."

(*d*) An expert knowledge of the mode of measurement of superficial, cubical and lineal dimensions; "numbered" items of various trades and other artificers' work employed in the erection and completion of buildings, together with the monetary value thereof, so that he may be able to place before the builder bills of the exact quantities of all materials and labour required, upon which bills the builder may make a correct estimate of cost for the purpose of tendering.

It may be mentioned that certain institutions and societies possess charters granted by the Crown giving them certain privileges and official recognition.

EGYPTIAN OBELISKS AND WORKMANSHIP: WITH A NOTE ON STONEHENGE.

By W. R. LETHABY.

THIS excellent book* by an expert is all first-hand observation or fresh thinking over the problems involved. The substance is technical; but the results are presented in such a clear, explanatory way that anyone might read it with ease. The author gives the history of an obelisk from the moment the ancient Egyptian engineers arrived at the granite quarries of Aswan until it was erected a finished monument of one block, weighing anything up to 1,000 tons. The author's recent clearance of the gigantic unfinished obelisk lying in the Aswan quarries has enabled him to be very definite on the main points of the problem. The book is fully illustrated, special attention being given to examples of the old technique seen in the quarry.

In the first chapter a general account of obelisks is given. Their origin and significance are somewhat obscure; "In sanctuaries of the fifth dynasty the obelisk took the place of the holy of holies of the later temples. Recent excavations have shown that these were different from those familiar to visitors . . . the shaft merely served the purpose of elevating the sacred pyramid or *ben ben*—the real emblem of the sun." The author then passes to an account of the great unfinished obelisk at Aswan, "which was never cleared until the end of the winter of 1922: all the visitor could see was the top surface of the *pyramidion* and about 20 yards of shaft, which sloped down into a vast heap of sand, chips and granite boulders. The obelisk is a piece of work that failed owing to an unexpected fissure in the rock. . . . Here we may see gigantic embankments on which the great blocks were transported, half-finished sarcophagi, and statues abandoned in various states of completion." The partially-isolated mass of granite, which is surrounded by a worked-out trench, is 137 feet long and would weigh about 1,160 tons. On it are many setting-out lines and measurements which are explained by the author. The trenches about the great mass were made by pounding with lumps of hard, greenish-black stone (*dolerite*): "All over the quarries, and especially round the obelisk, may be seen hundreds, some whole and some broken."

A long chapter treats of "architects" who erected obelisks: "The ancient records give us glimpses of the men who were responsible for their quarrying and erection. . . . Fortunately, the tombs of most of the obelisk architects are known to us, since their efforts were usually rewarded by the present of a tomb in the most fashionable part of the Theban necropolis." Here they recorded "what good workmen they were, how well they treated their subordinates, and the titles and decorations granted to them. But they say nothing as to how they did their job. . . . One obelisk at Karnak was erected by a noble called Ineni—Pasha, Count, Chief of all the works in Karnak, &c., &c. . . . After assuring us that he was a really first-class engineer, and immensely popular, he records the death of the King. . . . I became great beyond words; I will tell you about it, ye people; listen and do the good that I did—just like me. I continued powerful and met with no misfortune; my years were spent with gladness. I was neither traitor nor sneak, and I did no wrong whatever. I was foreman of the foremen and did not fail."

A second obelisk at Karnak was erected by Sennemut, chief "architect" at Karnak, Luxor, &c., &c. So great a favourite was he with the queen that he shared with another the bringing up of her daughter and heiress. A statue showing Sennemut holding the child Nefrurê (pretty name!) is illustrated. The queen's power seemed to rest on Sennemut and two other nobles (one of whom was also "an expert in obelisks"). His titles were Pasha, Count, Royal Seal-bearer, Sole Companion, &c., &c. "There is no doubt that Sennemut was the power behind the throne." An inscription says: "I was the greatest of the great in the whole land; one who had audience alone in the Privy Council. I was the real favourite of the King; foreman of foremen; superior of the great; one to whom the affairs of Egypt were reported. . . . I was a noble who was obeyed, I had access to the writings of the prophets; there was nothing which I did not know concerning what had happened since the beginning." His name appears at the quarry—"Sennemut came in order to conduct the work of the two great obelisks." Another of these "architects" was Controller of the Houses of Silver and Gold, High Priest of Ammon, and Director-General of Craftsmen: "I inspected when his Majesty erected obelisks. I pleased his Majesty while conducting the work on his monuments."

A fourth "architect" was a priest and prophet, and then High Priest of Ammon for twenty-seven years. He was Chief Overseer of Works to Rameses II: "I made for him a temple. I erected obelisks whose beauty approached Heaven. I made very great doors of electrum. I hewed very great flagstaves. I made great barges, I the Pasha and High Priest of Ammon."

I wonder what the exact meaning of the signs here and elsewhere translated "architect" may be? These high priests and nobles were, it is clear, rather ministers of state and commanders of the great "army" of labour engaged in building works than architects in any sense that we can understand. They were not chief workmen, but high commissioners and chief permanent secretaries of the Office of Works.

There is an interesting—especially to Londoners—reference to a later architect proper in the account of the obelisk now on the Thames Embankment. It and another now in New York were once a pair at Heliopolis and both had been moved to Alexandria in Roman times. Ours had fallen, but the American obelisk was still standing. The angles at the bottom of this one had been broken and bronze blocks had been put at the corners to support it. These were in the form of sea-crabs, and bore inscriptions in Greek and Latin, giving the name of Pontius the architect (APXITEKTON), who set it up at Alexandria in the year 13–12 B.C. (A photograph of one of these fine bronzes was once sent to me from New York. A reproduction of the original with a short description of the facts, if inserted in the base of the London monument, would add to its interest.)

The account given by the author of the methods of searching for suitable material, setting out the lines of the monument, and extracting it from the quarry are most informing. Long straight lines seem to have been obtained by vibrating a stretched string as carpenters do to-day. Flat surfaces were tested, either by sighting three rods (compare a much discussed passage in Vitruvius), or by testing, "as in engineering work to-day, by putting against them (the surfaces) a portable flat plane smeared with red ochre and oil, or 'ruddle,' as the red-lead and oil now used for the purpose is called." (The same method was made use of by the Greeks and the "red canon" is mentioned in their "specifications.") A block of granite was detached as mentioned above by pounding out a trench around it, thus breaking up the granite into a powder. "Nowadays work with rammers is always done to a sort of chanty, and there is ample evidence that the ancients made similar use of songs. With a good chanter who can extemporise rhyming lines full of personalities the work the Egyptian can do is little short of marvellous." The author experimented with this pounding method of working granite and proved that it can be done quickly.

Passing to the erection of the completed monolith, the author objects to Choisy's suggested method and works out another whereby it was gradually lowered from a ramp of earth into a funnel-shaped pit filled with sand. On the sand being gradually removed the great block found its basis with exactness "the obelisk is introduced into the funnel on a curved way leading from the surface of the embankment. The sand is removed by men with baskets through galleries from the bottom of the funnel." All this is clearly explained by photographs from a working model.

On reading in the short reference to the earliest obelisks the statement that the small pyramid at the apex seemed to be the essential part, and a symbol of the sun, I turned to the index to see if the great monumental pyramids were mentioned, but they are not. More than thirty years ago I was drawn to the conclusion that the pyramids must represent the Universe as conceived by the Egyptians, and I wondered now whether the sun symbol is not the pyramid of rays falling on the square earth from the sun at the apex of the "firmament?"

. . . . . .

A point of special interest appears in the fact that the author by carefully analysing the measurements marked on the granite finds that a foot of 11.77 inches was used for the setting out. This foot is practically the same as the Roman foot, which was used for works executed in London. It is also the Greek foot used (for instance) in the erection of the Temples of Artemis at Ephesus going back to the eighth century B.C. Our modern English foot which is about a quarter of an inch longer than the Egyptian foot must come from the same standard through the Greek and the Roman. Some years ago I ventured to suggest in *The Builder* that as the diameter of Stonehenge was about 97 feet English, it looked as if it had been set out to be 100 antique feet. The carrying back of such a standard to Egypt makes this possibility less unlikely, and what follows must be considered with the same question. Stonehenge is a wrought stone monument and the stones were dressed (as clearly appeared on a surface then newly exposed, which I saw many years ago when a lintel fell) by *bruising* off the surface rather than cutting it. A large number of hammer stone "mauls," or hammers, were found in the excavations of a few years ago which it was agreed had been used in the execution of the work. The discovery that obelisks in Egypt were dressed with hard stone boulders is a further confirmation as to the method of work at Stonehenge, and another link of connection with Egypt. "The trench and pits [in the granite rock] were not cut out, but rather bashed out. . . . These balls measure from 5 to 6 inches in diameter, their weight averaging 12 pounds. The blows were struck vertically; this suggests that they were shod on rammers. . . . The next step was to render the surface flat. This was done entirely by bruising with the balls of dolerite. Examples of unfinished dressing can be seen." Again, it seems obvious that the great lintel stones at Stonehenge were lifted on an earth ramp such as seems to have been the most usual form of scaffolding in Egypt. Recent studies have brought out the increasing likelihood that megalithic monuments spread from Egypt, and the points just mentioned are evidence in the same direction. The precision and accuracy of Stonehenge as an *architectural* monument is hardly understood. When it was new it must have been dazzlingly fair. Again, decimal numbering seems to have been used in the "design" of the monument. There were five great trilithons, having 10 uprights and 15 stones in all, and the circle has 30 uprights and as many lintels, 60 stones together. 5, 10, 15, 30, 60, 75 is a series that seems to point to a decimal base, and this makes the diameter of 100 units all the more probable. Considering the character of the work, I cannot think Stonehenge earlier than, say, 500–800 B.C., a thousand years more recent than is generally supposed.†

* "The Problem of the Obelisks: From a Study of the Unfinished Obelisk at Aswan." By R. Engelbach, Chief Inspector of Antiquities, Upper Egypt. (London: T. Fisher Unwin.) Price 9s. net.

† What is said of numbers and measures at Stonehenge is, I find, a memory of a remarkable study of the monument made by Sir W. Flinders Petrie some forty years ago. The ancient foot, he deduced, was 11 inches, "a unit originally derived from Egypt that could have been introduced at any date into Britain."

ITALIAN TRAVEL NOTES.

I.—SOME ADVICE TO STUDENTS.

By THEODORE FYFE.

STUDENTS of architecture come and go, but they all go to Italy—at least, they all ought to go if they don't. Now going to Italy is an easy thing. One can take a ticket at Cook's, decide to take a particular boat train, and just get there. After a certain experience—the journey and arrival, to wit—one can find oneself on a cool, dark night, or on a light morning, in Milan or Turin or even Venice. How much exactly one gets out of the experience of journeying depends to some extent on one's youth, but more on one's zest for strange things. The love of travel is a gift, but it may be fostered and educated. It is important to know in most things how to go to work.

First, as to *Equipment.*—Even more now than in the past it is valuable to travel light when on a tour of a few weeks. A journey of two or three months, or longer, is a more serious affair, but one way or another one's baggage demands care. I remember that on my first trip to Italy, when I was six weeks away, I was able to carry all my luggage and myself for a mile, when I was pushed to do it. As a considerable part of my luggage was sketching equipment, this was not a bad achievement. Clothes may be severely compressed and still be adequate. Dress suits are rarely required, and are best left behind, if serious study is intended. A good waterproof cape or light mackintosh is more important than an overcoat. A cape is really good, as it is admirable for keeping sketching things dry, and with it and an umbrella, heavy rain can be resisted. A strong waterproof lined canvas bag with a shoulder strap, made to hold one's drawing board and all materials, is a great thing, and one's razor, &c., can occasionally be dumped into it, when there is uncertainty if night will overtake an expedition. It is hardly necessary to expand on the actual sketching and measuring requisites, but an opera glass should be included, as it is often invaluable for detail. One thing should be borne in mind when thinking of clothes—it is often advisable to look as like an Italian as possible. A good, unassuming lounge suit will always be safe, as the Italian male likes English fashions, but the Italian hat is more subject to the passing vagaries of fashion. Therefore, it is not a bad plan to travel in an old hat that will crush away, and buy a new one—which may be cheap—in the first good-sized town in Italy one stops at.

Second, as to *Language.*—Few English people know Italian well, or take the trouble to cultivate its accent. It is very important to do the best one can beforehand in this respect, but even a carefully-studied phrase book is much better than nothing. It is easier, I think, to get up a fair working knowledge of Italian, than of most other European languages, and if one studies pronunciation, the way is made much easier to understand the Italian when he talks fast to you. Talk all the time; the Italian is very courteous and will listen to you if he knows you are trying. Go to Italian inns; if you are blessed with a good digestion, you will feed more healthily and interestingly if you do. Don't go to swagger hotels and mix with English people, or you will miss half the pleasure of travelling in the by-ways. For this last, the small print of Baedeker is invaluable. Use your Baedeker discreetly, but use it. It is worth all its weight—not, after all, considerable. You can learn about the country in all sorts of ways if you will. Scorn not the obscure café or the wayside vendor of fruit. If you drink a country's wine you drink other things as well, besides keeping healthy. It is remarkable how the real instinct for travel is fed by simple things and how many Britishers miss this matter. Another great way of learning the language is to travel third class in local journeys and to talk to the country folk. The Italian countryman is a simple, primitive person, glad to know about you and your doings, though not inquisitive in an annoying sense. You can listen to his idioms with advantage, and practise your halting phrases on him with impunity, as talking to him is like talking to a child. It is very pleasant to bowl along quite comfortably in an omnibus train in the summer time, with no draughts, as there are merely openings where windows usually are.

When you have once got even a hand-grip on the language, buy newspapers and try and master a little bit of one every day. Listen to railway officials calling out the names of stations in journeys and keep a sharp ear for the stressing (or otherwise) of the penultimate syllables—a great deal of Italian pronunciation hangs on that. A friendly waiter will often teach you a lot and you can ask him in an off moment to read a bit of your newspaper, and thus check your own attempted pronunciation of the same. All this tends to the ultimate object—to understand the Italian when he talks to you.

Third, as to *Food and Accommodation.*—If you are a novice, it is as well to begin in a fairly good hotel where some English and French is spoken, taking your breakfast in it and an occasional dinner, but taking most of your meals in outside cafés or restaurants. There is at least one good eating house or *trattoria* in every place that is more than a village, and there you can sample Italian dishes, as a good working knowledge of these gives you an immense pull. There is nearly always an ordinary (*piatto al giorno*), and this can be counted on with fair certainty to be both reliable and satisfying. Quite often it is very appetising. In a primitive village you are best at the inn for all your meals, and at the worst you can fall back on cheese and fruit, with eggs if you can get them, and an occasional cut of roast veal (*arrosto vitello*), or a beefsteak (*bistecca*). When you are more up to things, it is often a good plan in a town to stay at a lodging (*locanda*), and take all your meals out, though such places will often arrange to give you morning coffee, rolls and butter. If you go to an inn (*albergo*), choose it with care. The best ones have a popular *trattoria* attached, and you are nearly always both well housed and well fed in such places. If you leave your baggage at the station, you can sample one or two before you settle down. Real Italian inns are usually clean and comfortable, even though the sanitary arrangements are primitive, and I have only once met with a damp bed. Your room won't cost you much, especially if you bargain for it and make a quiet fuss about essentials. Shut the door and put a clean tumbler under the sheets of the bed for a few minutes: if it comes out clear, the bed is quite dry. After a long journey and you arrive at your inn at night, there is one comforting item which can be obtained over the length and breadth of Italy—a glass of *zabaglione* (yolk of egg skilfully mixed with sherry)—which is both food and drink.

Fourth, as to *Work.*—For every architectural student who goes to Italy with a definite purpose there are at least five who go with only vague notions. To these I would say: map out your tour, and know, as far as possible, the things you must see. You will very soon discover things you want to sketch or measure, and you should lose no time in getting down to them; but don't miss the larger view. In any small town, find out the local characteristics in painting as well as architecture, and broaden your outlook by a visit to the local museum or picture gallery. It is a good thing to begin there. Visit your churches early, both for light and because many of them close at noon. In larger towns you will want at least a day to do your main sightseeing, but even in them you should quickly devote the best half of the day to work. It is astonishing how careful study of one subject will teach you about other things. Do not try and see too much at one time or you may get bewilde and do nothing. It is a good plan to conc trate on a particular line of study and st closely to it. I once had five days to spend Sicily and a wise traveller advised me to conc trate on the work of the Mediæval period took the advice and have never regretted Some day I will go back and see the Classi work. This is a big subject, and hard and f rules cannot be laid down; but a temptation the student to become aimless certainly exis tending to lead him away from the education eye and mind and hand by serious study. learn in fact, by activity, not by discursi sightseeing; but a morning of meditati wandering with a purpose is sometimes t activity.

Fifth, *Where to go.*—Italy is a land of c trast, but it is one country. You can go to t north in the autumn or the spring, but need n necessarily avoid all the south in the summ The worst months are, perhaps, August (beca of dusty heat) and November (because mosquitoes). But with discretion one can tra through the length and breadth of the land any season of the year. Bari, in Apulia, delightful in July; an hour of the forenoon c be occupied by bathing and an hour of the aft noon in resting. Hill towns like Perugia, As and Siena are delectable all through the summ and a short stay at Naples can be as fascinati in June as in February. In September make the real north—the Trevisan or the Val Camon —and avoid a long stay at malarious places l Ravenna. But if you feel done up at Raven you can pick up Rimini, not to mention Urbi Ancona is a fascinating bathing resort Bari.

Where to go is as big a subject as what to but here again one must concentrate. Th are beats that must be done *in toto*, by the selves, and in a tour of a few weeks it is unw to try and see Rome as well as Venice. So useful lines of study are (a) the north beat fr Milan to Venice, west to east, taking in Pav Saronno, Como, Bergamo, Brescia, Veron Vicenza, and Padua; (b) a more southerly be west to east, from Turin, taking in Piacen Parma, Cremona, Modena, and Mantua; (c) t Marches, Bologna and Ferrara to Ancona, way of Pesaro (for Urbino), and this might made to include Ravenna and Rimini, perhaps Spoleto; (d) an Umbrian trip; (e) t central west—Genoa, Pisa, Lucca, Sien (f) Apulia. Rome, Florence, and Naples, with their districts, can be taken by themselv For the rest, one passes notable places li Pistoia, Prato, Orvieto and Montepulciano, main line journeys. The wisdom of travelli light is proved when one decides sudden to stop at a place, often a refreshing a useful thing to do; but such procedure mu be worked out carefully in relation to tick taking.

Sixth, as to *Permits and Introductions.*—T Italian Government has now issued new reg lations for admission and study in museum galleries, &c. Bona-fide students can obta permits, through the British School at Ron for an annual tax payment of 10 lire. Wi such a permit the student could probably d pense with the usual letter of recommendati issued by the R.I.B.A., when seeking the go offices of the custodians of churches and oth non-Governmental buildings. In general, should be said that every personal introducti possible should be obtained beforehand, a this is particularly important for the Vatican Rome. A letter to a member of the Scotch Irish Colleges in Rome, or, better still, to son highly-placed ecclesiastic, is invaluable. T British Consul in any of the large towns is oft a most valuable ally, but any assistance he cou give in matters ecclesiastical could only personal, not official. Except in the Vatica a student who is courteous and civi.-spoken all, and who adopts Ruskin's invaluable advi of giving a sacristan a liberal *buona mano*, c usually secure all that he wants.

The second article in this series will deal wi a northern tour from Milan to Venice.

"The Builder" Calendar.

Our Calendar this year is a drawing, by the late H. W. Brewer, of Pardon Church and Cloisters.

A London Vista.

There is no finer vista of its kind in London than that depicted by Mr. Raffles Davison on one of our plates this week, where the long frontage of Somerset House is seen through one of the bridge arches. It must have been extraordinarily fine when the river came right up to the lower story of Somerset House.

New Building, Gresham-street and Wood-street, E.C.

This building has been designed as a City warehouse, which can be arranged, in part, to give office accommodation. Every consideration has been given to secure light both from the exterior and from the interior areas. The building is to be of Portland stone, and the expression aimed at is extreme simplicity and the avoidance of architectural display.

Messrs. W. H. Lorden & Son, Ltd., are the contractors; Messrs. Crittall Manufacturing Co. are supplying the metal casements; lifts by the Express Lift Co.; steelwork by Messrs. Dorman, Long & Co. The carving is to be carried out by Mr. P. G. Bentham, A.R.B.S. Mr. Bylander is the consulting engineer, and Messrs. Richardson & Gill, FF.R.I.B.A., are the architects.

Cambridge University: School of Bio-Chemistry.

This building has been erected for the University of Cambridge by the Trustees of the late Sir William Dunn. It will be occupied by Professor Hopkins and his staff as a School of Bio-Chemical study and research.

The contractors are Messrs. William Saint, Ltd., of Cambridge, who have carried out the work under the direction of their agent, Mr. Braine.

The building is constructed of fireproof material with sand-face brick exterior facings and Portland stone dressings with Clipsham stone base and York stone steps. The roof is covered with Dawson pantiles. The entrance hall and stairs are treated in Subiaco stone, and all furniture and fittings have been to special design and made by Messrs. Wm. Saint, Ltd.

The sub-contractors are:—Electric light and power, Messrs. Higgins & Griffiths, Ltd.; asphalte work, Messrs. Lawford & Co.; heating, ventilation, hot water, steam, compressed air and hot rooms, Messrs. Mumford, Bailey & Preston, Ltd.; carving, Mr. Joseph Whitehead; Subiaco stonework in interior, Messrs. J. Whitehead & Sons; metal casements and wrought-iron work, Mr. William Smith; locks and door furniture, Messrs. James Gibbons, Ltd.; sanitary fittings and laboratory sinks and wastes, Messrs. Doulton, Ltd.; blinds, Mr. B. Holden; roof tiling, Messrs. Roberts, Adlard & Co.; fibrous plaster, Messrs. F. De Jong & Co.; steel roof principles, Messrs. A. Dawnay & Sons, Ltd.; patent roof glazing, Messrs. Heywoods & Co.

The clerk of works is Mr. G. T. Murton, to whom the architect and trustee are greatly indebted for the care, attention and skill devoted to the work.

Sir Edwin Cooper, F.R.I.B.A., is the architect.

Menin Gate Memorial.

A description of the foundations of the Menin Gate Memorial is given on p. 72. Sir Reginald Blomfield, R.A., is the architect, and Dr. Oscar Faber, O.B.E., D.Sc., the consulting engineer. Messrs. Somerville are the contractors.

West China Union University, Chengtu, China: Principal Gateway.

This gateway is the principal entrance to the University. With its flanking colonnades it expresses the spaciousness and dignity of the component groups of University buildings, whose higher roofs will be visible from the wide square. The building is of local brick, the walls of the great arch being unrelieved save for some small windows. The roof is in the grey-brown tiles of the district with patterns of glazed tiles. Glazed tiles are used in the frieze and upper tower, while bright colour adorns the rafter feet, beams and carved brackets. Messrs. Fred Rowntree & Sons, of 11, Hammersmith-terrace, W.6, are the architects.

Memorial to the Missing at Cape Helles.

This monument is designed specifically for the place it will occupy on the top of a cliff with a sheer drop of 100 ft. Being a country subject to earthquake, special consideration had to be given to the foundations. The monument is 25 ft. sq. at the base, tapering to 10 ft. 6 in., and then raised in the form of an obelisk to a height of about 100 ft. above the raised platform. Four plain stone Nabresina panels bear the names of the warships and military units engaged. On the north side of the approach will be placed a panel bearing a dedicatory inscription.

Sir John J. Burnet, A.R.A., is the principal architect. The contractors are Sir G. F. Payne Gallwey, Brown & Co., Ltd., 58, Victoria-street, S.W. 1.

Memorial at Port Thewfik.

The site for this memorial is at the southerly point of a promontory jutting into the Gulf of Suez, and which holds a commanding position of ships passing through the canal. It will be executed in Nabresina stone, and is in the form of a square obelisk, 65 ft. high and 12 ft. square. It has a reinforced concrete foundation placed on timber piles. It will be fitted with panels bearing the names of the Indian Regiments engaged in the Egyptian Expeditionary Force. Two couchant tigers are represented as guarding the memorial—the one from the canal, and the other from the sea. Sir John J. Burnet, A.R.A., is the architect, and Mr. C. S. Jagger the sculptor.

Liverpool Cathedral.

We give two progress photographs, specially taken for *The Builder*, of Liverpool Cathedral. Mr. G. Gilbert Scott, R.A., is the architect.

"Ockhams," Edenbridge.

This house has been recently altered by Mr. Baillie Scott as a country residence for himself.

New Premises for the Anglo-Persian Oil Company.

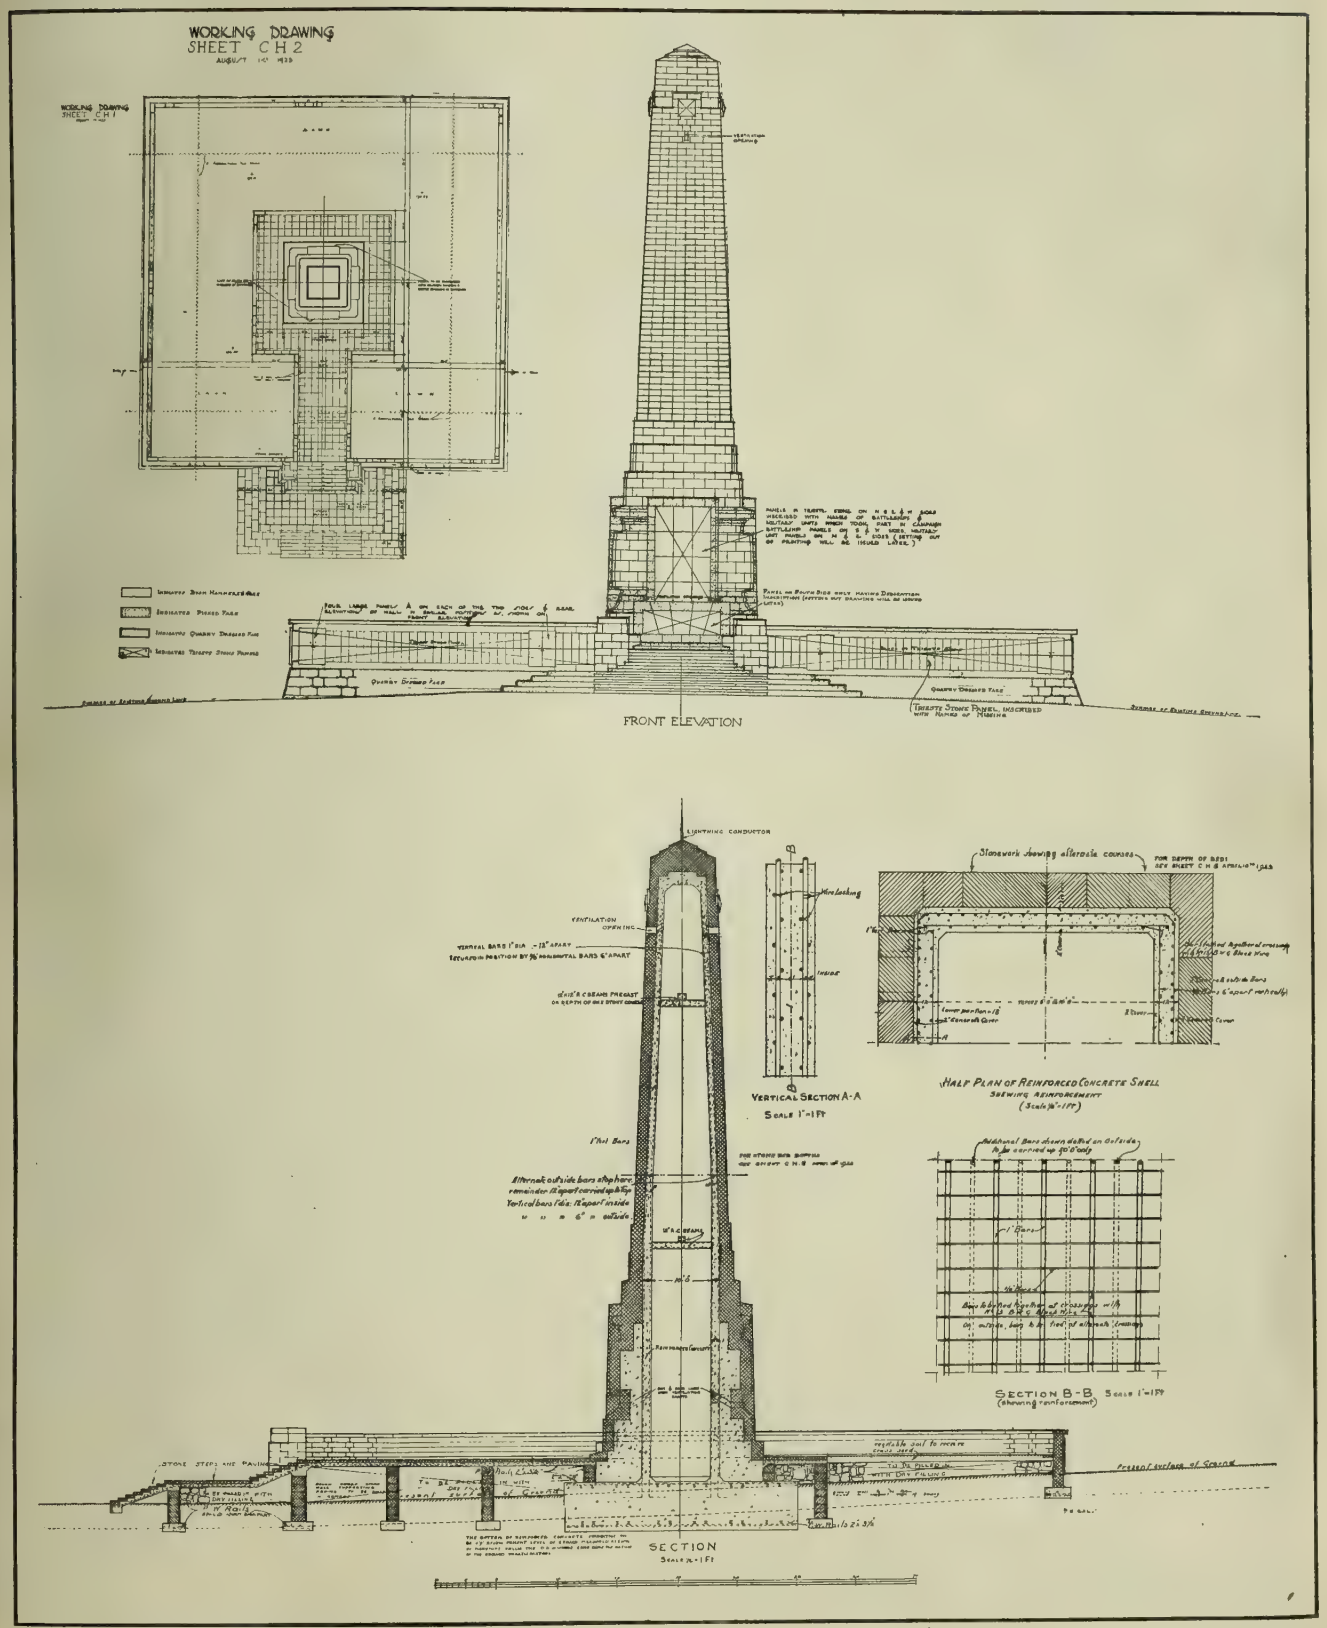
The building illustrated on p. 64 is being erected on a site having four frontages—one to Moorgate, one to West-street, one to Finsbury-circus, and another to South-place-mews. The building, which is the largest at present being erected in the City of London, has been carried out to the design of Sir Edwin Lutyens, R.A., and for the Anglo-Persian Oil Company, Ltd., who propose to occupy the building with their own staff and with all their subsidiary companies, such as the British Petroleum Co., and others.

The building consists of basement, lower ground floor, ground and seven floors over. The general excavation was to a depth of about 30 ft., and was continued through the usual "made" ground and through the old Moorfield Marsh, which covered this district to a depth of nearly 10 ft. for a period of about five hundred years, being just outside the old London Wall. Antiquaries have made many interesting finds during the progress of excavation. The Moorgate frontage was close to the line of the old Walbrook, which passed this spot on the way to the Thames. The building is continued over the Moorgate Station, Great Northern & City Tube, the foundations of which are continued to a depth of about 90 ft. right through the existing tube to steel grillage below.

The general contractors for the work are Messrs. Howell J. Williams, Ltd., of 7-17, Bermondsey-street, S.E.; the steel construction is by Messrs. Redpath, Brown & Co.; artesian wells by Messrs. C. Isler & Co., Ltd.; central heating with oil fuel boilers by Messrs. R. Crittall & Co., Ltd.; steel sashes by the Crittall Manufacturing Co., Ltd.; electric wiring and fittings by Messrs. Higgins & Griffiths; plumbing by Messrs. Stitson, White & Co.; synchronised clocks by the Synchronome Co., Ltd.; locks by Messrs. Joseph Kaye & Son; slating by Messrs. Sterling & Johnson; lifts by Messrs. Waygood-Otis, Ltd.; stone preservative to the Portland stone fronts by Messrs. Raines & Porter, Ltd.; pneumatic tubes installation by Lamson Pneumatic Tube Co., Ltd.; marble by Messrs. H. J. Jenkins & Sons, Torquay; internal telephones by the Relay Automatic Telephone Co., Ltd.; strong-room doors by the Chatwood Safe Co.; hardwood partitions and fittings by Messrs. Howell J. Williams, Ltd. The carving has been executed to the designs of Sir Edwin Lutyens, R.A., by Messrs. Broadbent & Co.

Progress Views.

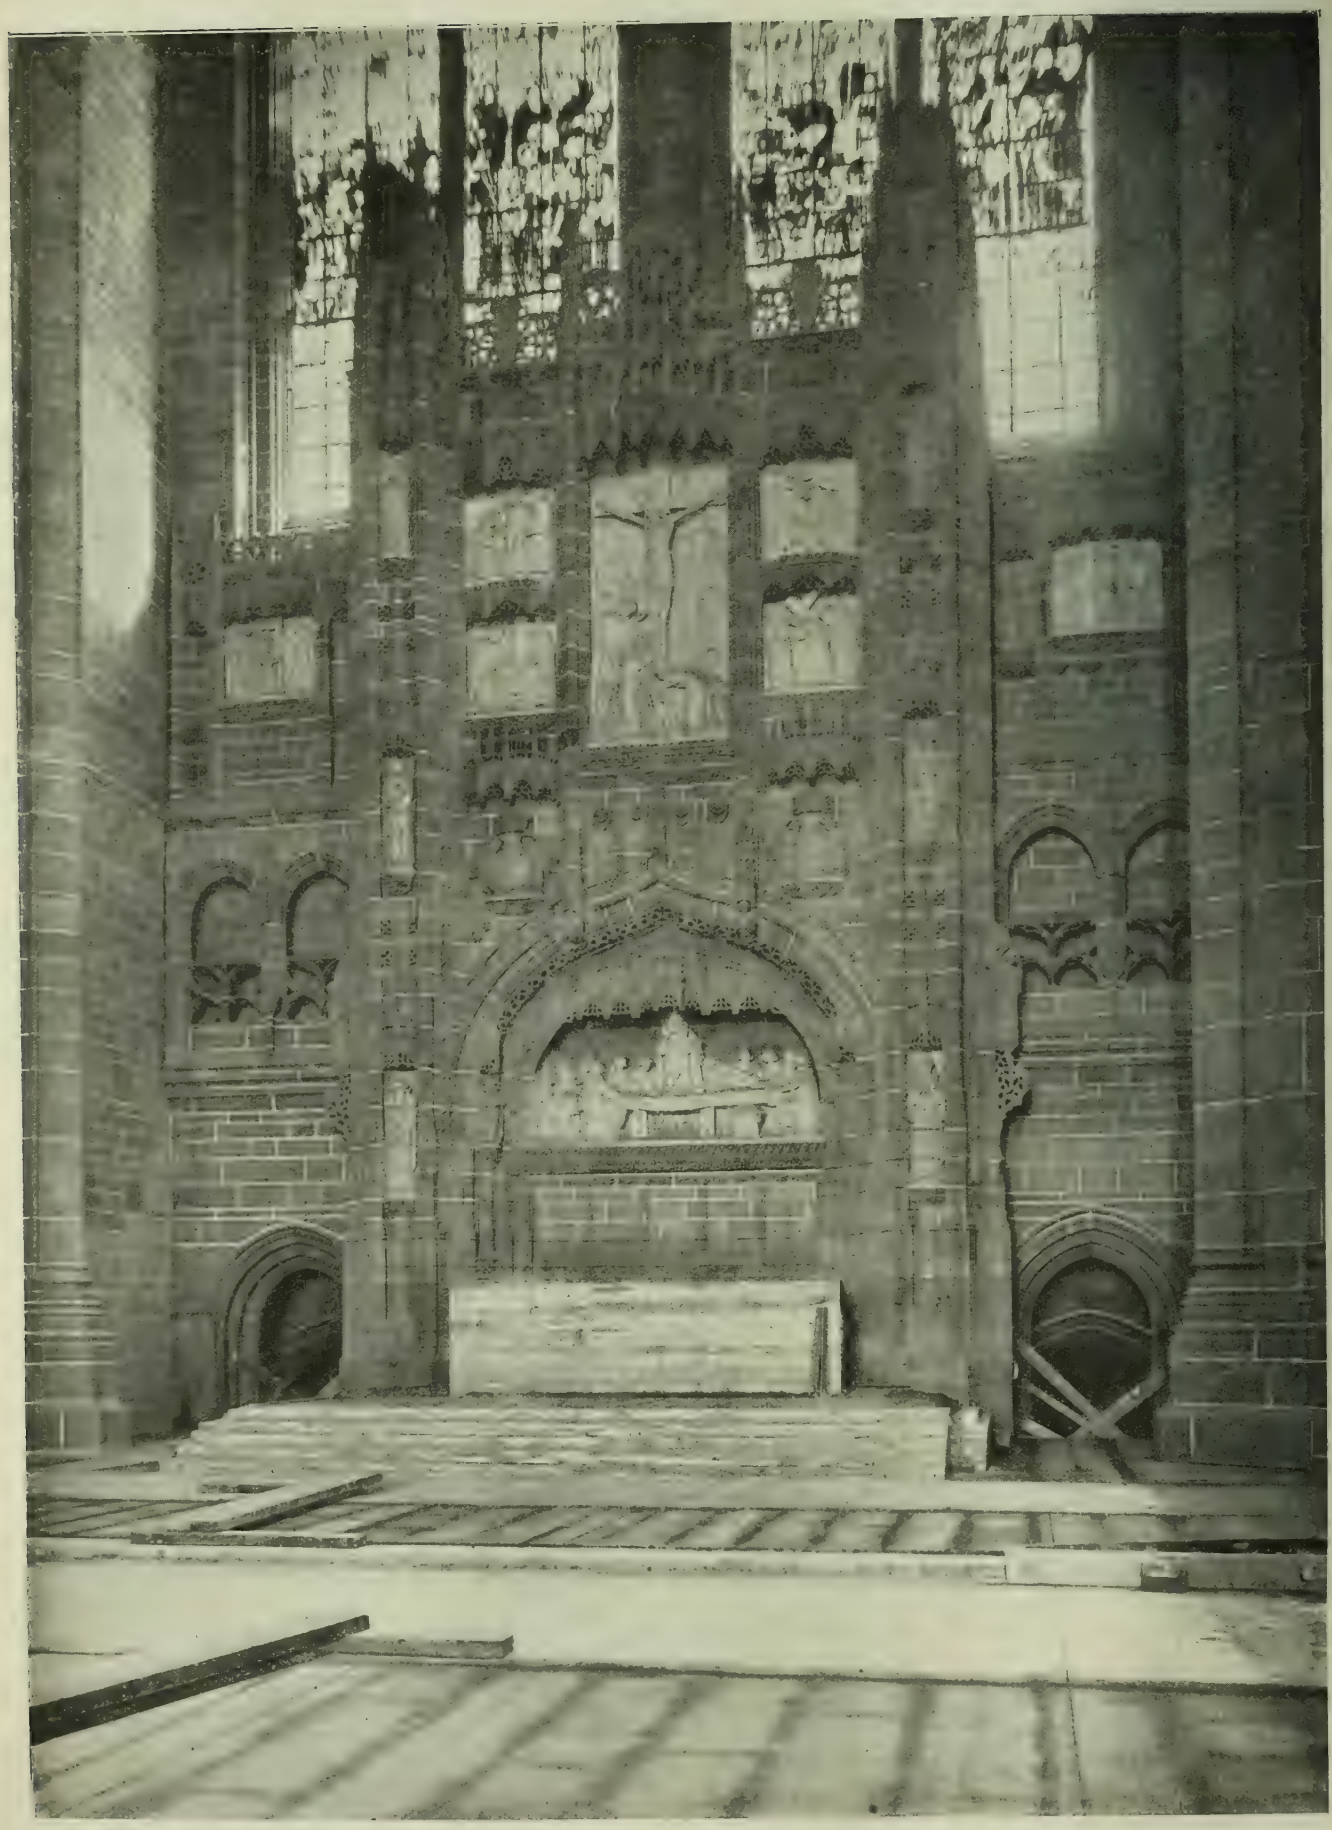
The progress views show typical examples of the large number of commercial buildings now being erected in Central London. They include the new premises of the Anglo-Persian Oil Co., in Moorgate-street (Sir Edwin Lutyens, R.A., architect); the "Fortune" Theatre, Russell-street (Mr. E. Schaufelburg, architect); Banque Belge pour l'Etranger, Bishopsgate (Sir Edwin Cooper, F.R.I.B.A., architect); alterations to the Criterion Restaurant (Messrs. Wm. Woodward & Sons, architects); Messrs. Peter Robinson's premises, Oxford-street (Messrs T. P. & E. S. Clarkson and Mr. Austen Hall, joint architects); Messrs. Liberty's premises, Regent-street (Messrs. Edwin T. Hall, F.R.I.B.A., and E. Stanley Hall, M.A., F.R.I.B.A., architects); and new premises in Holborn (Messrs. Gilbert & Constanduros, architects).



Nos. 105-109, Strand.

This building, which consists of two basements, ground floor and six floors above, will have a Portland stone front in which there is no main cornice. Part of the site was originally Terry's Theatre. The premises will have a considerable depth, and will overlook the Savoy Chapel and square at the rear. A feature of the site is the way in which it falls away at the back. This drop is so great that even the floor of the sub-basement will be at ground level at the far end of the premises, and both basements will light directly on to the road. The contractors are Messrs. Rice & Son.

Messrs. Trehearne & Norman are the architects.



New Premises for the Gresham Life Assurance Society, Ltd.

A description of this building, for which Mr. T. B. Whinney, F.R.I.B.A., in conjunction with Messrs. Campbell Jones, Son, & Smithers, are the architects, is given on p. 67.

[The above drawing shows the proposed re-building of this block of premises. Half the site is to be occupied by the Saxone Shoe Co., Ltd., and the remainder of the site has been taken by Mr. F. G. Minter, building contractor, for development. Mr. Minter will be entrusted with the re-building of the whole block, but no sub-contracts have yet been let as the scheme is in its preliminary stages. An attempt has been made in designing the elevation to maintain the character and spirit of this part of London, made so famous by the Adam Brothers when they rebuilt the Adelphi. This forms part of the important Strand widening which is being carried out by the London County Council, and is immediately westward of the new "Tivoli" building which was lately opened. The new frontage line will coincide with that of the "Tivoli" building, and it is anticipated that when the widening of the Strand is extended down to Charing Cross Station the present congestion of traffic in this busy thoroughfare will be lessened.]

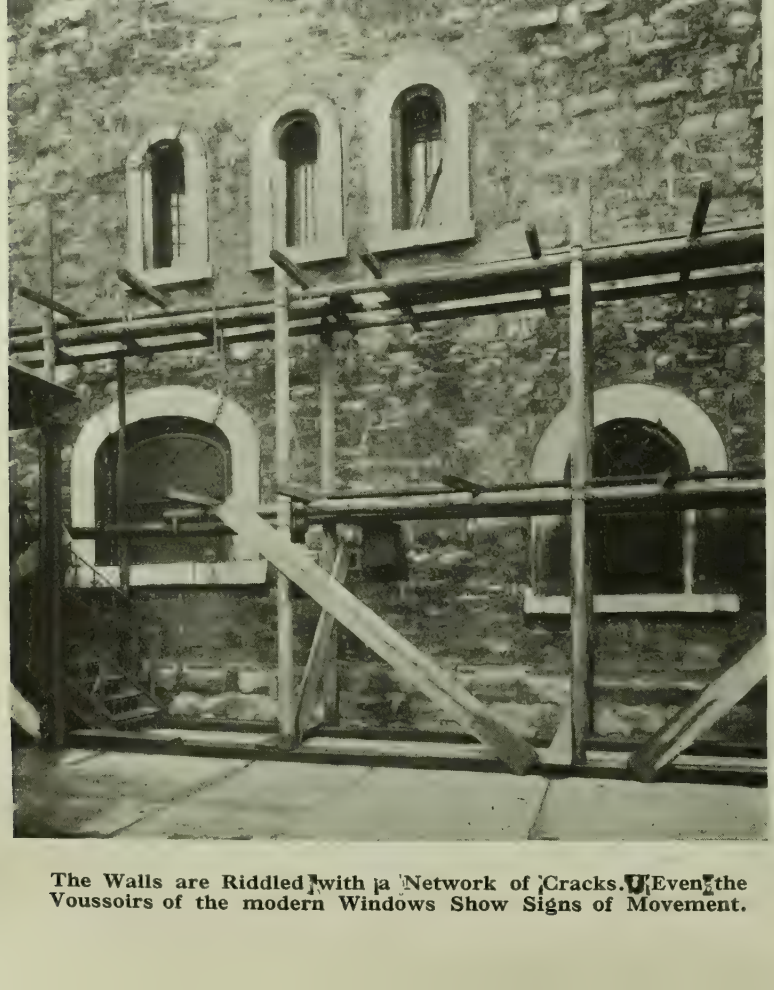
Westminster Hall Before the Recent Work of Conservation. From a Drawing by MR. T. RAFFLES DAVISON, Hon. A.R.I.B.A.

THE JEWEL TOWER, WESTMINSTER.

By W. HARVEY.

The preservation of Richard II's Jewel Tower at Westminster would be worth while were it only to keep in mind the accuracy with which Shakespeare has portrayed the character of England's most luxurious monarch. The jewelled insignia of royal state are continually referred to in his play, and the tragedy of Richard's fall is heightened by contrast with the artistic magnificence of his former tyranny. The King, who "every day under his household roof did keep ten thousand men," and who is reputed to have caused a garment for himself to be made of gold, silver, and precious stones to the value of 3,000 marks, may well have felt the need of a treasure house in which to preserve jewels obtained by his unjust and unconstitutional exactions. The charming but dilapidated building which now forms part of the Weights and Measures Office has suffered severely from decay and alteration since its original erection; but a fine chamber on the basement floor, ceiled with a ribbed vault, retains something of the sumptuous character imparted to it by its builders, who probably acted upon the express directions of their æsthetic sovereign. The chamber contains two bays of rib and panel vaulting, with level ridge-ribs meeting in grotesque carved bosses, where flowers unknown to botany merge imperceptibly into queer beasts as the spectator changes his position in looking up at them. One of the larger of these bosses (shown in the illustration) appears to be a somewhat outlandish vegetable product with four principal leaves when viewed from below, but reveals itself as a four-headed, open-mouthed monster when inspected from the side. The walls of the chamber are not very thick in proportion to the span and height of the vault, and no sign of buttresses remains upon the exterior of the building. It is not altogether safe to argue from this that none were originally provided, since the walls have obviously been repaired out of all knowledge, with windows, probably far larger than the originals, inserted in recent times.

It would be, however, quite in accordance with mediæval structural economy to dispense with buttresses where the vault of a ground story chamber was to be abutted by continuous solid walls supplied with the plentiful top weight of an upper story. Top weight may be made to modify the direction of an arch thrust, although, as was pointed out in Chambers' Cyclopædia of 1783, this function is only performed in ideal perfection when the top weight is infinitely great.



Notwithstanding the spread of cyclopædic knowledge and the growth of theoretical science, a rash experiment of comparatively recent times came near to overthrowing the whole tower. At some unrecorded date, but sufficiently recent to be described by Sir Gilbert Scott as "modern," the ground-floor chamber above the Gothic vault was also provided with a stone ceiling. This was given the form of a low elliptical intersecting barrel vault of plain ashlar set in mortar.

The tooling of the stonework resembles that of some repairs to Westminster Hall executed under the direction of Sir Robert Smirke in 1834, and, failing a more accurate figure, this date may be provisionally accepted for the construction of the ground-floor vault.

Part of Internal Walling and Vault Springer, with Modern Brick Patching and Serious Fractures before Present Repairs.

Long before the time of Sir Robert Smirke the theory of arches and vaults had already received the attention of scientists, Sir Christopher Wren himself having left a short tract on the subject; but as words were multiplied, practical good sense seems to have disappeared, and it is a remarkable fact that the use of the arch as a normal feature of ordinary utilitarian building construction was most common before the discovery of the principle of Catinaria. At the Jewel Tower theoretical knowledge seems to have been a poor substitute for the practical experience that comes readily to those who are working in the main current of a living tradition. The height of the new vault from the ground was a factor which should have been taken into consideration, but no special devices were employed to mitigate the damaging outward pressures of the vault, which naturally act with worse effect when applied at a high point than at a low one, since their leverage is increased in respect to the point of application of those forces by virtue of which all buildings stand—the pressures of the soil upon the foundations. The old walls, built, as was usual in Gothic times, of a facing of ashlar with an internal core of rather indifferent rubble, began to yield to the strain. A second story above the new vault supplied enough top weight above the points of application of the vault springers to stave off immediate collapse, but the walls bowed out and became riddled with a network of cracks, showing themselves as faint lines in the ashlar facings and as horrible cavities in the disintegrated internal core. Matters were by no means improved by the heavy loads placed upon the floor, which had been laid upon the upper surface of the vault and the lime concrete filling of the vault pockets. The upper chambers of the tower were used as a place for the storage of standard measures, generally made of ponderous metal. The repairs of the structure were postponed from time to time to suit the occupation of the building by the Weights and Measures Department, and it

The Walls are Riddled with a Network of Cracks. Even the Voussoirs of the modern Windows Show Signs of Movement.

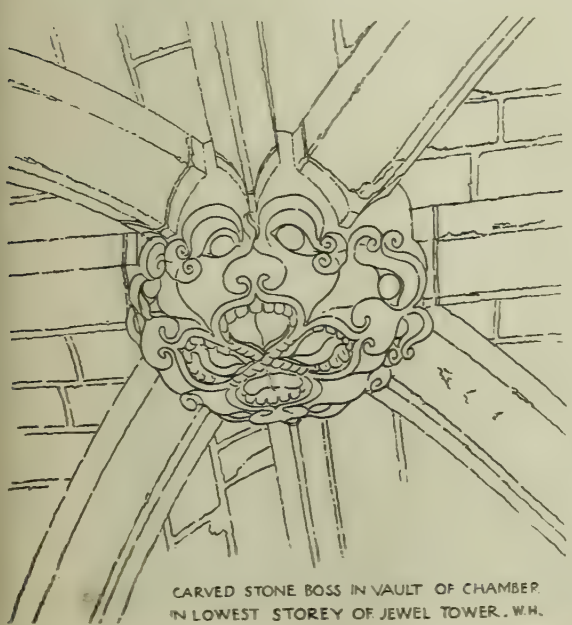
was only upon renewed signs of movement in the bulging walls and the dangerous displacement of stones in the modern vault that the work of preservation was at length taken in hand.

Critics often express a wish that the buildings "might be left alone and allowed to remain just as they are," and this postponement of repairs long known to be necessary should indicate that in this instance repairs have not been applied without very careful consideration.

System and routine are in evidence in the methods of the conservators, but they are of such a nature as no sane man need find objectionable. Certain rules are indeed invariably applied, and each building is subjected to minute scrutiny, with the view of discovering the cause as well as the symptoms of its decay, in order that the best and most lasting cure by the least conspicuous means may be devised and put into operation. What shall be done to the building is only determined in the light of a full inquiry into its present condition and historical defects.

These inquiries are often highly interesting in a structural and historical sense, since the strength as well as the weakness of ancient work is brought into prominence in a manner impossible to casual inspection. A trial hole excavated at the north-west angle of the building to determine whether some part of the decay in the shattered walls might not have been due to imperfect foundations revealed an exceptionally sound footing upon a bed of rammed chalk superimposed upon the heads of elm piles 5 ft. in length. The heads of the piles are nearly 12 ft. below the present ground level, and, except for a thin layer of water-soaked fibres, the wood appeared to be in thoroughly sound condition. The piles were round logs driven in close contact with one another in the Thames mud. It was decided that the foundation was probably sound and should be left alone, and that the defects were due to the feeble and composite nature of the walls and their core, in which dust and chalk predominated, and to the bursting action of the two superimposed vaults.

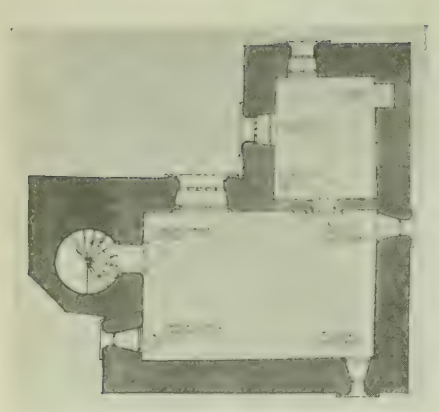
The lines on which works of repair should be designed were clearly indicated by the state of the building itself, and it was, therefore, proposed to make the defective walls as nearly monolithic as possible by a process of cleaning, grouting, tamping, and pointing applied from both faces, and to restrain the outward thrust of the upper vault by the insertion of a system of reinforced concrete beams and ties above its crown, and designed ultimately to form part of a reinforced concrete floor to the uppermost chamber. Works were commenced in the lower part of the building, and the principal or Gothic vault and its supporting walls have now been satisfactorily treated without mishap. Upon the erection of a scaffold about the building public interest and vigilance were immediately demonstrated by a protest from some friendly critics, who prayed that the present patched and "picturesque" appearance of the walls might be preserved. These critics seem to have ignored the structural problems involved in maintaining the vaults in equilibrium, and to have judged the whole case from the point of view of a single factor, namely, the external appearance of the building.



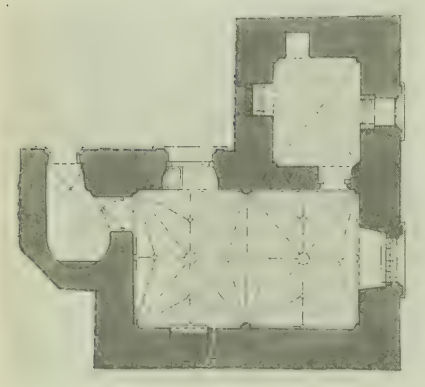
Such criticism is, indeed, far more valuable than crass indifference, and calls attention to certain aspects of the case, but it was not in this instance constructionally helpful, nor did it take into account the fact that in architecture appearance must go hand in hand with structural soundness if satisfactory results are to be achieved. It is doubtful, too, whether the advice to preserve the modern patches of tiles and bricks on edge and daubs of cement rendering could have been acted upon. Many of these extraneous additions to the decaying surface of the wall were themselves on the point of coming adrift, and could be shifted bodily with a touch of the hand, revealing again the old cavities they had been applied to conceal rather than to repair.

They are, perhaps, no worse than a great many other superficial patchings that have been executed on ancient buildings in other parts of the country, but they were in all probability put on only in the hope of keeping off the rain for a year or two until something better could be put in hand. Nothing would have been farther from the thoughts of the tilers of the last generation who dubbed on the patches of tiles than that their hasty bit of botched work should, in the course of fifty or sixty years, meet with blessing and approval from this generation.

The suggestion was nevertheless given careful consideration by the Historic Buildings Branch, but the state of the structure ruled it out as impracticable. Wherever fractures and cavities are found to be too bad for treatment with the existing stones and internal grouting a few old stones of similar character, obtained from demolished buildings, have been inserted as bonders so as to strengthen what were formerly the weakest parts of the wall. The insertion of the reinforced beam above the level of the upper vault will be a more difficult and hazardous operation, but the stability of the upper part of the wall will be guaranteed by the erection of heavy raking shores before the excavation for the beam is undertaken, and the work above the beam will also be consolidated in



Though Considered Picturesque by Some Observers, the Brick and Tile Patchings are being Replaced by Sound Old Stone Bonders to give Strength to the Shattered Walls.



CARVED STONE BOSS IN VAULT OF CHAMBER IN LOWEST STOREY OF JEWEL TOWER. W.H.

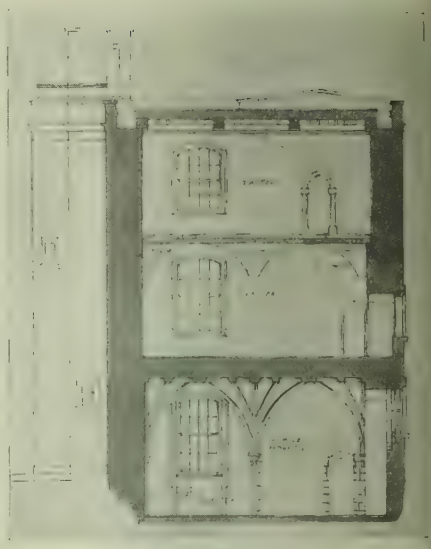
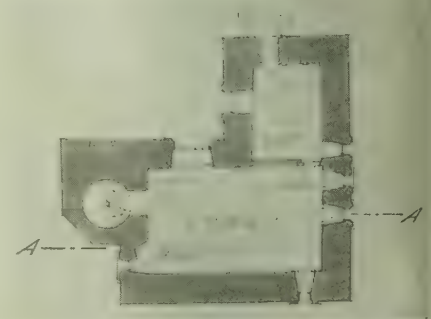
FIRST-FLOOR PLAN.

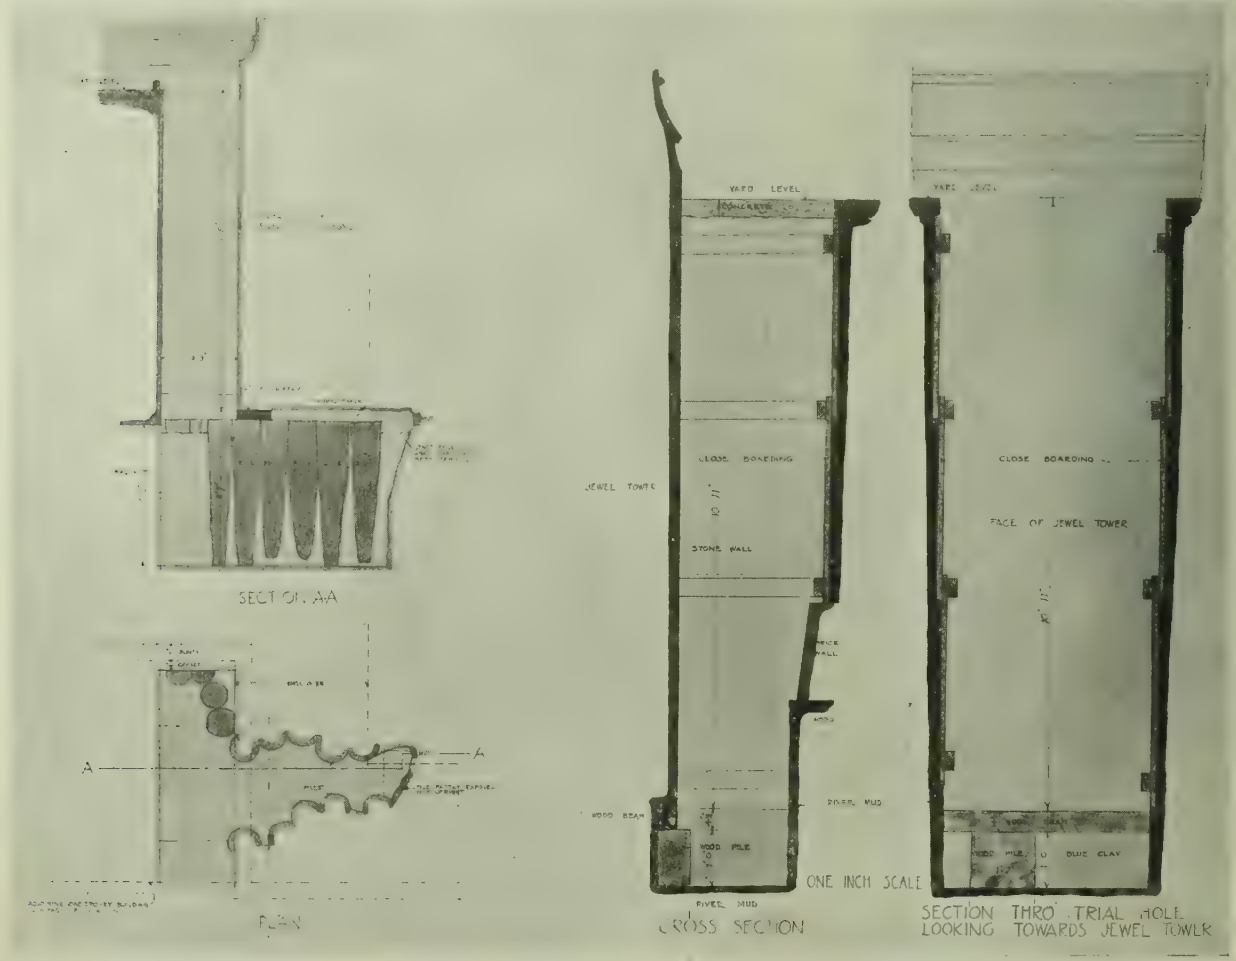


BASEMENT PLAN.



advance, so that whatever temporary supports may be used they will have something solid to act upon. The steel work for the reinforcement is made to take to pieces for convenient insertion in the cavities to be groped for it in the disintegrated core of the walls, and will be fastened together in position by means of special overlaps and fishplates, which will be left free of concrete for the purpose until the steel work has been thoroughly connected. The use of the tie-bars passing across the building to uphold the slipping stones of the vault and to form part of a reinforced concrete floor is worthy of note. The material is not only used economically, but the modern repair is adapted to the ancient work in a way that avoids, as far as may be, the well-known fate of new patches in old garments—a fate that was too well illustrated by the former fragmentary repairs.

In case any doubt remains as to the necessity of the work being put in hand it should be stated that the stones of the upper vault were slipped out of line to the extent of $1\frac{1}{4}$ in. Gaping cracks occur in the masonry of every corner of the building, and when one of the picturesque patches of modern tilework is struck with the fist showers of dusty *débris* run down the face of the work from fissures a yard or more away from the spot. The condition of the basement chamber, with its Gothic vault, where part of the work is finished and part remains in its old dilapidated state, is excellent evidence of the artistic reticence and discretion, as well as the workmanlike execution, of the present repairs.



The plans and photographs illustrating this article are published by permission of H.M. Office of Works.

TOWERS AND SPIRES.

I.—SALISBURY CATHEDRAL.

BY SIDNEY TOY, F.S.A., A.R.I.B.A.

THE erection of towers and spires over the central space of mediæval buildings presented problems of construction of such complex character as required the greatest ingenuity in solution, and, since the dynamic principles involved in these problems are constant and should be thoroughly understood, an investigation of the manner in which they were overcome and solved by the mediæval builders will form a useful field of study for the architect of the present day, who is often faced with problems of a similar nature. It is proposed, therefore, to devote a series of articles to the examination of some typical examples of towers with spires and similar finials erected during the Middle Ages over the central crossing of cruciform buildings: that is, in positions which before that time were usually covered by domes. The tower and spire of Salisbury Cathedral, though not in strict chronological order, will form the first subject for examination.

The cathedral church of Salisbury was begun in 1220 and, in respect to the church itself, was completed in 1258, but the upper stages of the tower and the spire were not added until about 80 years later. That the tower is the work of about 1330 is evident from its general character and details, and that so ponderous a superstructure was not contemplated by the first architect is obvious from the inadequacy of the support provided; but the exact date of the addition can only be inferred from the references to building operations in the chapter archives. In 1331 Edward III granted to the chapter permission to use the stone of the former cathedral at Old Sarum "for the improvement of the church of New Sarum and the close thereto belonging," and in 1334 Richard de Farleigh, an architect of repute, was commissioned for building work at the cathedral. It is probable, therefore, that Richard was responsible for the design and execution of the tower and spire, though the stones he selected for the facing of this particular work would be naturally taken directly from the quarry.* The lantern stage of the tower formed part of the church as finished in 1258, and this was covered, probably, by a timber fleche containing the bells; but even this weight and the thrusts set up occasioned considerable anxiety and arched struts with inverted arches above were soon thrown across the eastern transept, while about the period of the construction of the tower the bells were removed to an isolated campanile built for their reception to the north of the church.†

Before commencing the actual building of the tower and spire it was first necessary to support and secure adequately the lantern which was to form the base of the new work. This was effected by a skilful system of buttresses and ties. Flying buttresses were erected in the triforium and clerestory stages of the choir, nave and transepts (fig. 1). These were built in the rear-arches, as shown on the right-hand side of

* The provisionary character of the agreement between the precentor and Richard of Farleigh, showing as it does the timorous manner in which the proposals of the latter were regarded, lends additional support to this inference. *Vide*, "A History of Salisbury," by the Rev. E. E. Dorling, p. 71, and a monograph of the Cathedral by William Dodsworth, p. 151.

† This campanile was pulled down by Wyatt in 1790

The Tower and Spire of Salisbury Cathedral. (*See p.* 61).

e figure where the front arches are omitted, all cline towards the tower, and together form a werful system of what are virtually stone king shores, supporting the tower on all sides d distributing its thrusts over several arches the adjacent arcades. Diagonal flying ttresses were also added, which, springing om the re-entering angles of the aisle walls, vided near the head and abutted the angles the tower at two different heights, while low ttresses about 15 ft. deep were built against e tower on the top of the clerestory walls. aving established supports on all sides the ntern itself was consolidated by connecting e main piers of its arcades to the outer wall th stone webs thrown across the gallery, and the insertion of a powerful system of iron s at the level of the arches of these arcades. he latter securely clasps the walls of the tower gether both inside and outside, and is a fine ample of mediæval forging. It received the comium of Sir Christopher Wren, who was lled in to examine the fabric in 1669, and who tributed the preservation of the tower itself its presence; but the process of oxidation s produced serious effects on the stonework jacent to some of the ironwork employed, ough it was covered with sheet lead. Con-derable care and skill has been exercised in the nstruction of the two upper stages of the wer and the spire on this base. The squinch ches, which carry those sides of the octagonal ire falling on the corners of the tower, have eir voussoirs locked together by iron clamps ensure their rigidity despite their lack of equate abutment; and the tall pinnacles hich rise above the broaches, and are so cessary to counteract the thrust at these ints, are built hollow that their weight might distributed along their sides where it is quired and not act in the centre (fig. 2). he shell of the spire from the level at which it aches its true development throughout the hole of its height to the apex is only 9 in. thick. he newel stairways built at the corners of the wer, however, are a source of weakness and the course of time, probably owing to the reading of the great arches of the crossing, came considerably fractured.

Within the spire and rising from the upper stage of the tower to the apex of the spire itself is an ingeniously devised timber centering the design and construction of which will be understood by reference to the section and plans given in fig. 3. This timberwork, though considerably repaired during the seventeenth century and at later periods, doubtless represents the scaffolding erected for the construction of the spire, but it is equally unquestionable that it was especially designed with a view to its permanent retention in position as a security, of desirable elasticity, against the effects of storms and other adventitious occurrences. The lowest part of this work, in the tower, consists of two heavy beams 1 ft. 3 in. square and four strutted and braced uprights 10 in. square, and the underwork of the centering proper, within the spire itself, of two cross-beams supporting at their junction a central post which ascends through the whole height of the work to the level of the uppermost platform, and of four strutted and braced uprights rising from the crossbeams about midway between the central post and the wall. The resilient character of the junction of these two parts of the substructure will be appreciated by an examination of plan B.B. (fig. 3), from which it will be seen that the vertical timbers of the upper part have no correspondence with those of the latter. The head of the central post is pinned to the vane rod, and crossbars, projecting from the vane rod, are dowelled into the stonework as shown in fig. 3, so that the whole of the apex of the spire is securely held down to the timberwork beneath.

Such, then, is the design of this daring structure and the precautions taken for its security, and the result is a tower and spire of incomparable beauty, which concentrates and completes in an ideal manner the group of buildings beneath photograph. It has been, however, an occasion of considerable anxiety from the first. The great arches of the crossing became distorted and the substructure generally began to crack and settle. During the latter half of the fifteenth century arch struts were thrown across the transepts. In 1669, Sir Christopher Wren was called in to examine the fabric and, having noticed the important function filled by the iron tie, above mentioned, ordered other iron ties to be added. One of these additions is probably that at the base of the lantern, while others are those passed round the outside of the spire at various heights and seen in fig. 1 and the photograph. Reparations were also effected and iron ties added during the eighteenth and nineteenth centuries, particularly in 1865 when the lantern was secured by a whole network of iron ties. These last pass diagonally across the tower, and piercing the walls, are carried round the angles on the outside and over flat bars, laid vertically on the face of the buttresses. Wren estimated that the spire inclined towards the south-west, owing to the settlement of the western piers to the extent of about 2 ft., but subsequent and more accurate plumbing during the eighteenth century and within recent years has shown that the amount is 22⅜ in. and that this has not increased. The extent of the deflection is marked on the floor below the centre of the crossing.

It is interesting to record a simple act of faith in saintly protection performed by the builders of this spire after they had themselves taken every precaution to secure its safety. In a cavity of the capstone they inserted a relic consisting of a small piece of fabric, possibly a reputed fragment of the robe of the Blessed Virgin, enclosed in two boxes, the inner of wood and the outer of lead 5½ in. diameter. This was discovered in 1762, during the erection of a copper vane, and reverently replaced.

The Menai Straits.

The joint committee of the County Councils of Carnarvonshire and Anglesey appointed to consider the proposals of the Ministry of Transport for the erection of a new reinforced concrete bridge in place of the Menai Suspension Bridge, has decided to ask for a guarantee that the new archway it is intended to build will not hinder the navigation of the Menai Straits.

'ALL BUILDINGS, TALLER BUILDINGS, AND SKYSCRAPERS.

By HORACE R. APPELBEE.

HAT a difference is made by the way a is presented. A street is 20 ft. wide and buildings on either side 50 ft. high. Is street narrow, or are the buildings lofty? en Middle Row existed in Holborn, Staple was, I suppose, a lofty building, and now dle Row is gone and forgotten, Staple Inn owhere near so high as the street is wide. Italy the main cornice often projects to centre of the street. Is it a dangerous ection, or is the street narrow? In Venice w buildings so tall that one could touch walls on both sides of the street at the e time; and even in London I have ed a party-wall notice on the adjoining er when there was a street in between. someone has been to America looking tall buildings and skyscrapers. He has e back telling us horrible tales and utter- warnings. He complains they make dark ets and cause congestion of traffic. The e here with low buildings, I think.

f course, the fault with the tall buildings New York and Chicago is not that they too tall, but that they are too close to- er (which is quite another tale). The lt with the low buildings of Cheapside and od-street and other City streets is just the e: they are too close together. I assert hout the slightest fear of contradiction t for a given amount of accommodation n a given area, tall buildings will give re light, more air, more sunshine, more ce for traffic in a business centre, more ce for recreation in a residential quarter n low buildings.

Buildings 50 ft. high on both sides of a et 20 ft. wide suggest dark, confined ce and congestion of traffic. Buildings ft. high and streets 200 ft. wide suggest my mind well-lighted rooms, open spaces, l plenty of room to move. These figures not chosen by chance; they are the result certain calculations showing different ways putting the same amount of accommodation the same site.

As I believe in argument of the two and make four type I will endeavour to prove contention mathematically. Take a unit m (or floor space) about 20 ft. square and, , 10 ft. high. One hundred such rooms l exactly cover an acre. In the form of a are there will be ten rooms on each face. the ground is covered. There are no ets or alleyways, and no windows are pos- le. Now put one room in the centre of the e and the others on top as a column, and have a skyscraper; but we also have 99 cent. of the acre of space open around for traffic, and every room has a window every wall. A skyscraper 1,000 ft. high a base 20 ft. square would, of course, be stable, and there is no need to make build- law against it, as no one would attempt to ild it.

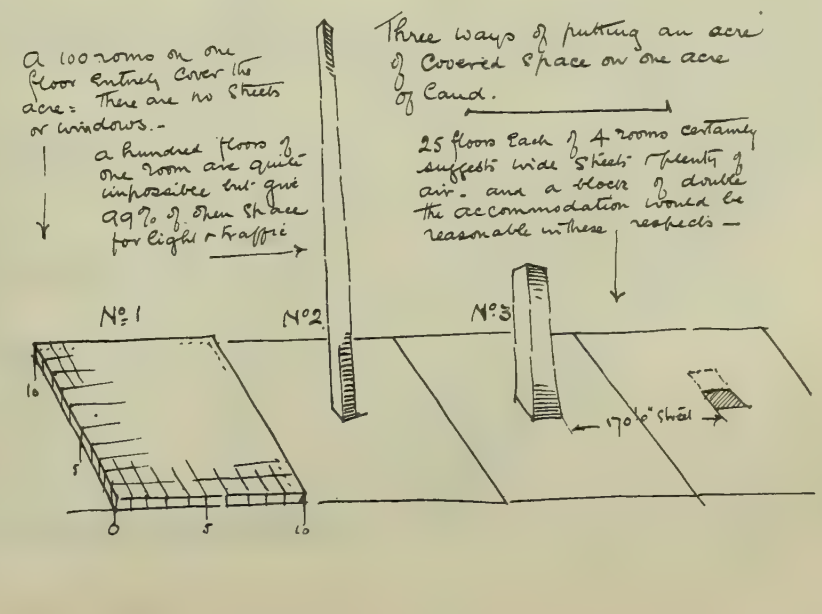
Let us restack our rooms, four on a floor d 25 stories high. The result would be a ilding perfectly stable, no doubt, and every om would be a corner room with two ndow walls. And if adjoining acres were be treated in the same way, the buildings uld be 170 ft. apart. That seems to prove contention sufficiently. It is, however, sible to improve greatly the arrangement placing each building opposite the space tween two buildings on the other side of street, and in that case, while the same ea is covered, the buildings are 380 ft. art. Assuming the stories as much as ft. high, the building would only total) ft. Wonderful open lighting, and 96 per nt. of the ground area not built on.

So far we have only considered an acre of vered space on an acre of site; we often get more, of course, but probably, looking at a large area or district, it never exceeds two acres of covered floor space to one acre of ground. (Exact figures are, of course, unobtainable.) With tall buildings such as I have described there would still be 92 per cent. of total area uncovered, and all could be street and available for traffic. If the buildings were reduced to a uniform four stories, only 50 per cent. would be uncovered, and of that a large part would be in the form of private lighting courts, so that street space would not be more than one-third or one-quarter of that possible with tall buildings.

Mr. Unwin quotes 45 ft. of rentable floor space per head of population as the result of his American experience. Presumably we must about double that to obtain the building area. The day population of the "square mile," known as the City of London, appears to be about 700 per acre. 700 by 90 gives 62,000 sq. ft. of building required, and this in a fifteen-story building needs a ground area of 4,200 sq. ft. only. By making the building cross-shape for stability we may need a little more, and, say, 10 per cent. of the area is covered and 90 per cent. available for street. The cross will be about 80 ft. overall on plan, and a square of one acre about 210, so that the buildings will be 130 apart or 170 between the arms. If every square were dealt with in the same way we should have a chess-board city, every square representing an acre, and on it one building containing 700 persons, and with 10 ft. stories, 150 ft. high and on the average considerably more than 150 ft. apart. Consequently no rooms above ground get less than an angle of 45 degs. of light, and the worst angle applies to only one room in fifteen against one in every two or perhaps three in our present city. All look out on to wide open spaces.

All streets could have a clear traffic way of 130 ft. with recessed portions 20 ft. deep on the pavement where people could stop and chatter or do real business. This would be improved if two of these blocks were brought up together, thus ++. Our main avenues can then be 260 ft. wide between the buildings and the minor streets 130 ft. as before.

The object of this article is merely to show that tall buildings, as such, are not an evil, but for a given amount of accommodation on a given area they will provide more light, air and sunshine, more traffic space in a business quarter, and more recreation space in a residential one. In both many of the main avenues could be planted with forest trees without detriment to the light of the buildings. It will help to realise the nature of the change if it is pointed out that most of the rooms on the first floor would have an unimpeded horizontal outlook between the buildings of almost unlimited extent, and the same would apply to the ground floor except for the traffic. In the City to-day how many get 100 ft. or even 50 ft.?



If we are to have new building law, let us, as architects, aim at the abolition of a maximum height clause, and for far greater stringency as to the angle at which light is admitted to a room used for office or residence. The London Building Acts require a good deal of amendment in this respect, especially the clauses relative to "light courts within a building." There is one point about by-laws we are apt to forget. It is that they are not made to protect an individual from the consequence of his own folly, but to prevent him performing an act of folly which will injure his neighbours. He is prevented from erecting an inflammable house in an urban area, not because he runs a risk of being burnt in his bed, but because the fire started on his premises may spread and injure others. It is much the same with air and sunshine. Nothing can prevent the owner closing and shuttering his own windows, but he must be stopped from preventing access of air and sunshine to others.

Having determined the model rules in these matters, we can apply them impartially to low buildings and high buildings. We shall then find, as a corollary to the previous proposition, that with equal amenities high buildings will give a greater floor area of accommodation than low buildings, on equal site areas.

[This article is of considerable interest at the present time, but we do not necessarily agree with all the opinions expressed therein, —Ed.]

Acoustics of Buildings.

Mr. Hope Bagenal recently lectured at King's College, London, on this subject. He asked his audience to dismiss popular notions on the subject, as they were nearly all misleading. It was common for a spoken syllable in a cathedral to last for five seconds and an organ note to last for ten seconds. The rate of syllables in conversational speech was something like four per second, so that with a reverberation of some five seconds in a lively sermon in a cathedral syllables assembled upon the ear twenty at a time. It was, he said, well known that new preachers in St. Paul's Cathedral were warned that their sermons must consist of only half the number of words that they would use in a parish church. The reverberation in St. Paul's Cathedral was such as practically to prevent rapid speech.

47-57, GRESHAM S

MESSRS. RICHARI

WOOD STREET, E.C.

B.A., ARCHITECTS.

Memorial to the Missing, The Menin Gate, Y

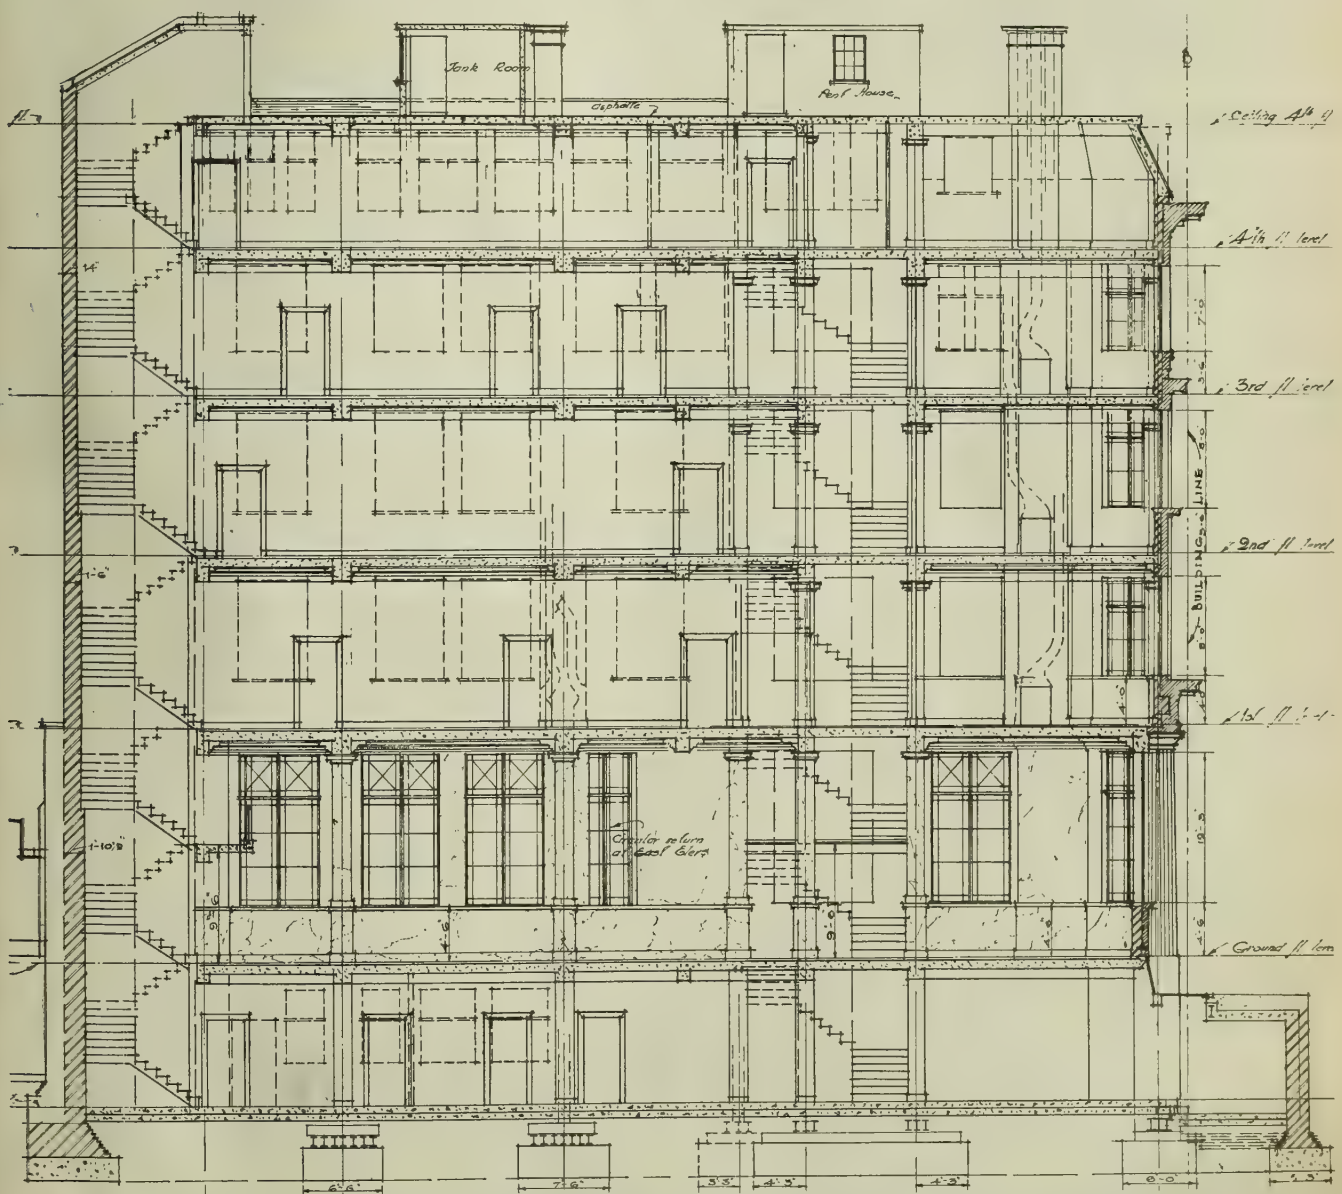
D BLOMFIELD, R.A., Litt.D., Architect.

NEW PREMISES FOR THE GRESHAM LIFE ASSURANCE SOCIETY, LTD.

Mr. T. B. WHINNEY, F.R.I.B.A., in conjunction with Messrs. Campbell Jones, Son, & Smithers, are the architects for this building. The elevations were designed by Messrs. Campbell Jones, Son, & Smithers. The building is of steel frame fire-resisting construction. A large area at the back is faced white glazed bricks. The fronts to Fleet-street and Clifford's Inn-passage are in Portland stone, with a granite plinth 3 ft. high. The floors are fire-resisting, steel cased in concrete. The door architrave is carved with low-relief leaf ornament. All windows are steel, those to the ground floor being bronze faced. There are ornamental iron railings to the cornices and balconies on the Fleet-street elevation, as shown. The basement contains accommodation for filing and storage, heating and ventilating plant, lavatories and kitchen for messengers.

The ground floor is 18 ft. high, with walls lined Calocara marble, and ceiling ornamented in fibrous plaster. The public space (corridors) is paved with Roman mosaic, the remainder of the floor being wood block. The lighting is by alabaster bowl fittings. The first floor is to be used by the heads of departments and general managers, and contains a large board-room, committee, and luncheon room. The second and third floors are to be used as offices, with a luncheon room on the third floor.

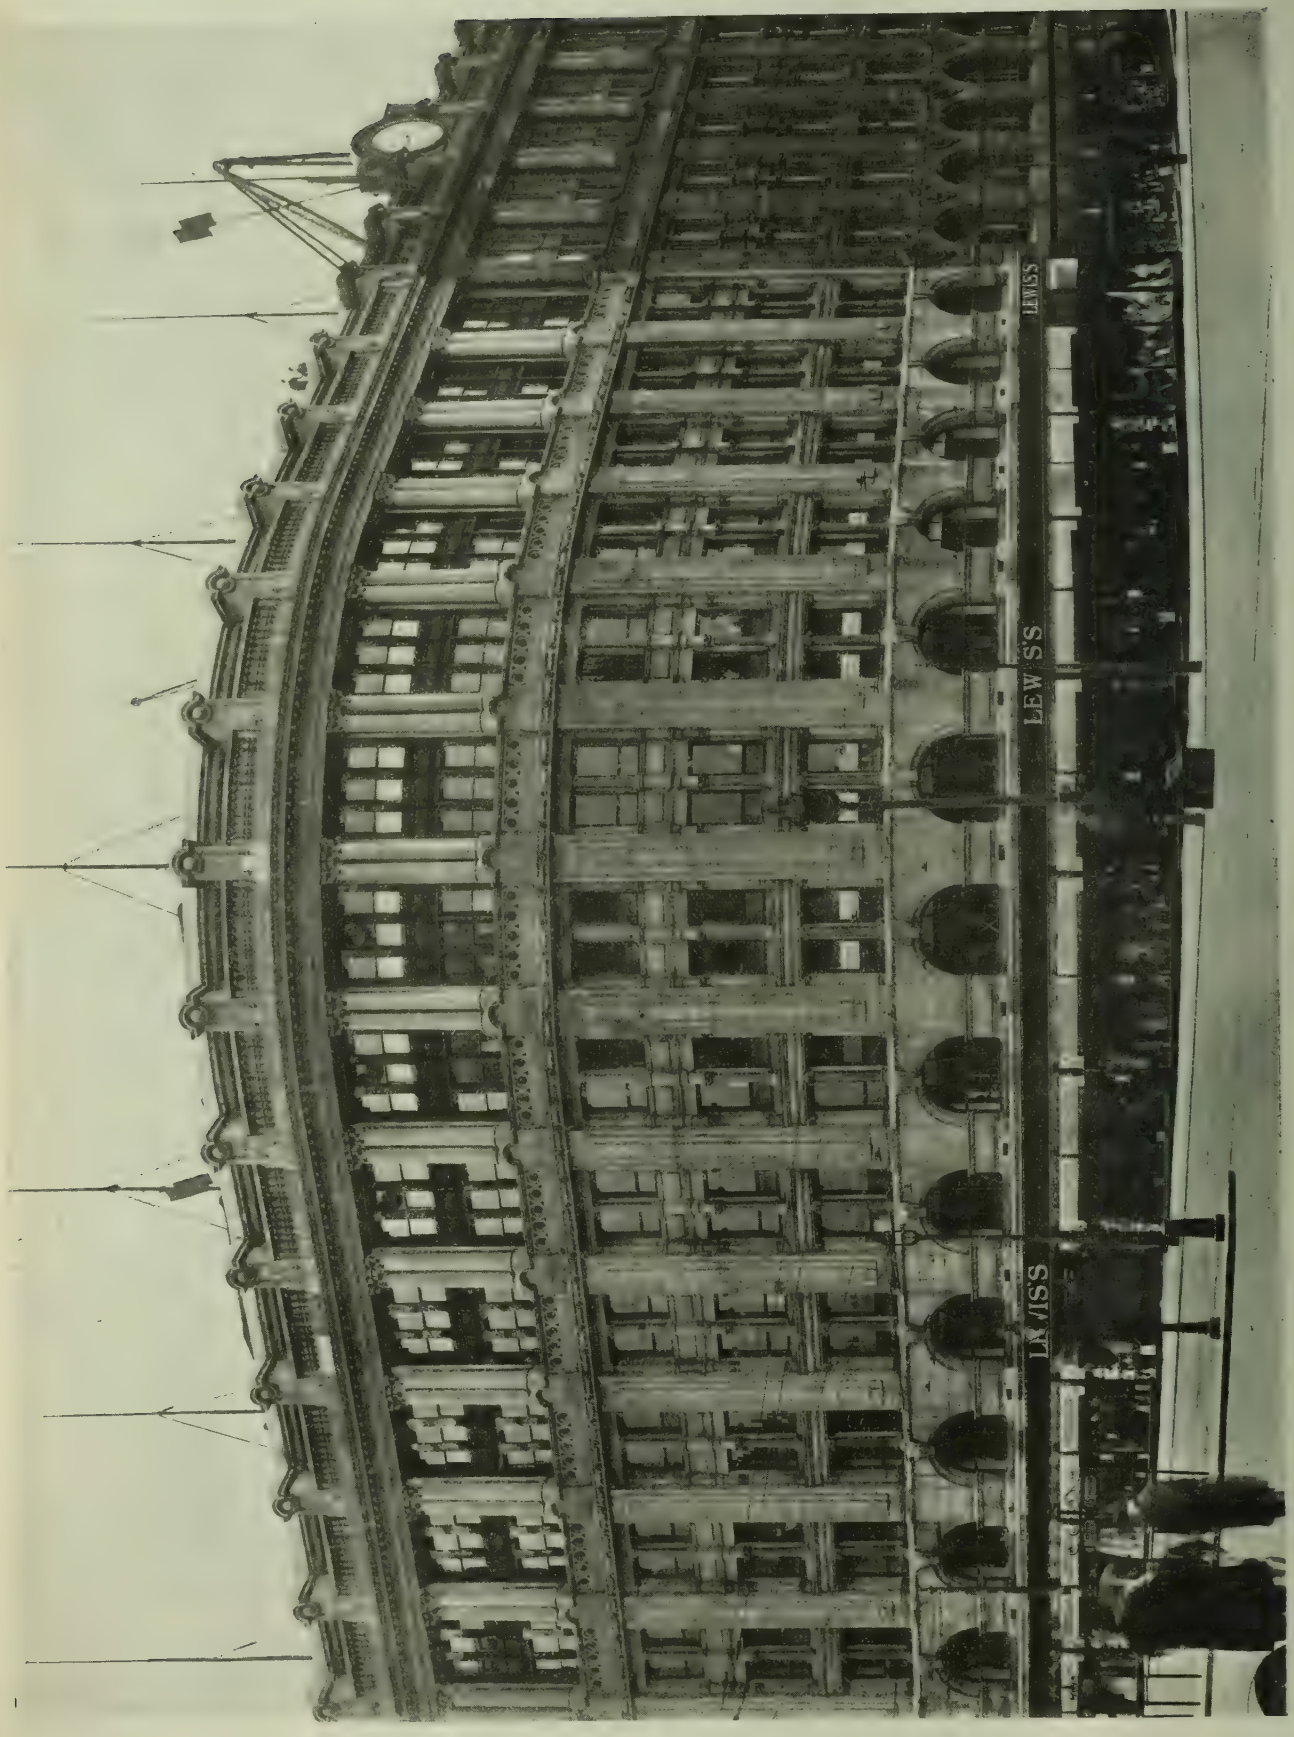
On the fourth floor are offices and caretakers' quarters. There are kitchens, servery and luncheon rooms on the first and third floors.



The stairs are of "Empire" stone, with marble dado. Mezzanine landings are placed between the ground and first floors, and have ornamental iron railings and bronze handrail. All other handrails are of mahogany, fixed with bronze brackets.

Heating is by low-pressure hot water; the basement is ventilated artificially.

The general contractors are Messrs. F. D. Huntington, Ltd., and the sub-contractors include: Steelwork: Redpath, Brown & Co.; stone: F. J. Barnes; floors: Kleine; windows and lantern lights: Crittalls'; drainage: Burn Bros.; electric wiring: Bell Bros.; strong-room and vaults reinforcements: B.R.C.; heating: Norris & Dutton; plumbing: Davis Bennett; lifts: Express Lift Co.; granite: Fennings & Co.; sanitary fittings: George Jennings; mosaic and terrazzo: Diespeker & Co.; fibrous plaster: John Tanner & Son; marble work: H. C. Tanner; ventilating plant: Sturtevant Engineering Co.; revolving door: Samuel Elliot (Reading); internal joinery: The Young Construction Co.; tile radiator backs and lavatory tiling: Martin Van Straatten; electric light fittings: Comyn Ching & Co., and Metropolitan Vickers Co.; wood-block flooring: Acme Wood-Block Flooring; metal railings: Comyn Ching & Co.; bricks: The Stourbridge Brick Co.; metal lockers: The Art Metal Equipment Co.; ironmongery: Marley Bros.; fire grates and tiles: O'Brien, Thomas & Co.; pavement lights and bulkhead lights: Hayward Bros.



Bristol's Slum Area.

At the last meeting of the Bristol City Council, Alderman Sheppard presented the report of the Housing Committee dealing with the clearance of slum area in St. James'. It is proposed to clear this area in sections; as soon as one block of the dwellings they were now building in St. Jude's was completed they would remove some of the people from the condemned area to it. This is part of a scheme which he hoped would be developed on a large scale. The area proposed to be dealt with, Eugene-street, St. James', comprises a very congested district, in which most of the houses were built in the early part of the eighteenth century.

ARCHITECTS AND BUILDERS' INQUIRY BUREAU.

THE new heading to this column marks the inauguration of what we trust will prove a helpful and instructive weekly feature. The frequency with which technical questions have been asked and answered in our correspondence columns has suggested the need for more prominent facilities for the free exchange of ideas among our readers. We shall, therefore, welcome the receipt of little problems which have puzzled our readers, and also solutions to the same as they appear to others. Where no satisfactory answers are forthcoming in the natural sequence of correspondence, our readers will be given access to the experience of our own technical staff, who will also endeavour to treat judicially the conflicting views which may be forthcoming, upon contentious subjects. We look to our readers to establish the success of this new feature, which we confidently expect to meet a long felt need to those interested in the art of sound building.

We take the opportunity of printing below a query received from a correspondent. The point raised is of such immediate interest that we welcome it as a very auspicious opening to "The Architects' and Builders' Inquiry Bureau."

Correspondence for this column should be marked on the envelope "Inquiry Bureau."

Solid or Hollow Ground Floors?

SIR,—I have been for some time a little puzzled in the quest for economical methods in the construction of small houses. I notice, for instance, that, while the architect generally favours solid ground floors, covered either with composition or deal boards laid in tar mastic, the speculating builder almost invariably favours the old system of light joists on sleeper walls, with, of course, the usual surface concrete under.

It would certainly interest myself, and I think many others, to hear what some of your readers would advise, together with the considerations that would influence their decisions, both as to cost, upkeep, and convenience. Modern conditions tend to exaggerate the relative importance of initial cost, though this often becomes the decisive factor.

I have had frequent complaints as to the ill effects of condensation gathering on the cold, hard surfaces of solid floors to the detriment of carpets, linoleums, and the general atmosphere and temperature of the house. On the other hand I find few houses with the old type of hollow ground floor, entirely free from mice and vermin.

I think we are a little apt to follow precedence in these matters without sufficient deliberation, and an occasional "inquest" will frequently break up a blind game of "follow my leader."

ECONOMIST.

Use of Tar for Paint on Steelwork.

We have received the following reply to the letter in our issue for December 28:—

SIR,—May I refer to the letter from a correspondent seeking information as to the above?

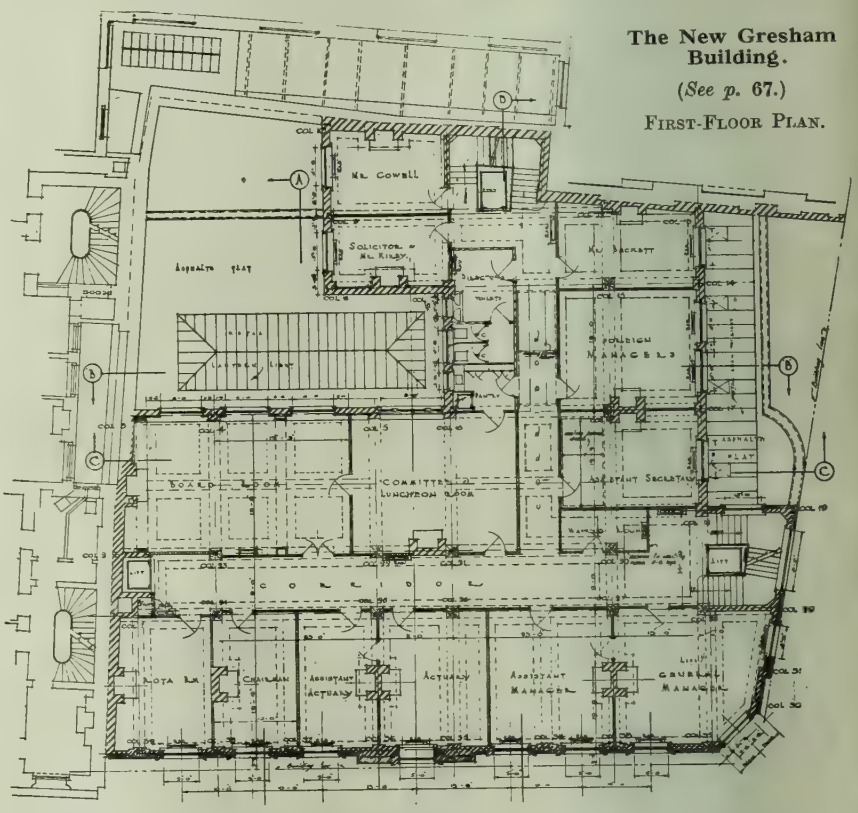
The specification he refers to is certainly an unusual one, as ordinary gas-tar is hardly considered a good covering for steelwork; besides being subject to softening during hot weather, it is always more or less sticky, and induces the particles of dust in the atmosphere to readily settle. Again, it is an impossible covering if following tints may be required at some later time.

I think it will be generally admitted that no paint which attracts destructive particles, and increases the resistance to impinging wind on or along its surface, can be said to be good.

I enclose a copy of a very interesting old report from a French engineer, who refers to the experiments of M. Valet, then Chief Engineer to the "Chemin de fer de l'est français." It will be seen from this that his conclusions as to the effect of tar on iron structures are not favourable. The surfaces of the structures were badly attacked when coated with tar, or paints prepared with tar or its derivatives.

The cracking of tarred surfaces is a well-known phenomenon, and it is expressed in technical language by the editor of my notes, thus, "with tars the dissolvent of the second coating dilutes and dissolves a part of the first, and also evaporation does not proceed in a regular manner—thus a paint is produced which is not of a uniform thickness—(this, of course, increases the surface resistance). With the departure of each volatile element a void is produced, and we get in the semi-fluid coating as many cavities as there are particles lost if the molecular attraction is not sufficiently strong to reunite the elements in the line of dis-aggregation . . . the phenomena of retreat gives cause to spots and gaps by which the humid air will rapidly have access."

It is also pointed out that cheap paints composed of tar products are slightly volatile and decompose into their stable products. It is stated indeed that "tar preservatives are useless," and that iron minium (iron oxide) paint is the best. I trust that your correspondent may find assistance in these remarks.



It will be understood that I am largely quoting from the papers mentioned in my possession, and also that, where reference is made to paints, it is to "cheap tar paints," and that there is and can be no reflection on any of the very well recommended bitumastic paints and compounds on the market.

THE FOUNDATIONS OF THE MENIN GATE.

WE give in this issue a perspective and working drawings of the Menin Gate Memorial, of which Sir Reginald Blomfield, R.A., is the architect. The following particulars regarding the foundations of the memorial have been supplied by Dr. Oscar Faber, O.B.E., D.Sc., consulting engineer for the work :—

The difficulty with regard to the Menin Gate from an engineering point of view was the nature of the foundations. A trial hole revealed the fact that the soil consisted, on the average, of the following formation :—The top 4 ft. black loam and ashes, below that yellow and grey clay and sand extending down to blue clay, which was found at a depth of about 27 ft.

This yellow and grey clay is entirely waterlogged from a distance of about 12 ft. downwards and behaves practically as a quicksand under certain conditions. So treacherous is it that a trial hole 12 ft. by 8 ft., in which the sides consisted of sheet piling extending down for a distance of 35 ft., was found almost impossible to excavate as the quicksand leaked through between joints in the piling and the bottom rose at night as rapidly as the excavators were able to deal with it in the daytime. It was found impossible to drive an excavator with runners more than 12 ft. deep for the same reason, namely, that the bottom kept blowing upwards.

The original design for the foundations consisted of hollow concrete foundations more or less in accordance with the section on Fig. 1, and alternative designs were considered for this box foundation in plain concrete and in reinforced concrete, the drawing shown in Fig. 1 being actually that for plain concrete. After the result of the trial hole above referred to it was, however, found possible to avoid the difficulties of this excavation by constructing a reinforced concrete raft just below road level and supporting this on reinforced concrete piles 40 ft. long, 16 in. square. These piles extend a matter of 16 ft. into the blue clay and carry on an average about 30 tons each. Those at the sides of the foundations are raking so as to deal with the horizontal thrust due to the arch in one direction and to the pressure of the earth from the ramparts in the other. These two pressures tend, of course, to counteract each other, but it was impossible to estimate their magnitude without a risk of error and therefore some provision was made to deal with a horizontal thrust in either direction. The general arrangement of the piling is shown in Fig. 2.

The whole of the superstructure also consists of reinforced concrete clothed in stone on the exposed surfaces, except in the case of the soffit to the arch and the floors over the loggias, &c., where the reinforced concrete will be visible.

The main arch and the loggias have a coffered soffit which is to be constructed by casting it direct in specially prepared moulds. Fig. 3 and Fig. 4 indicate this coffering, and also indicate the general nature of the reinforcement, both in the arch and in some of the vertical and horizontal members of the abutments.

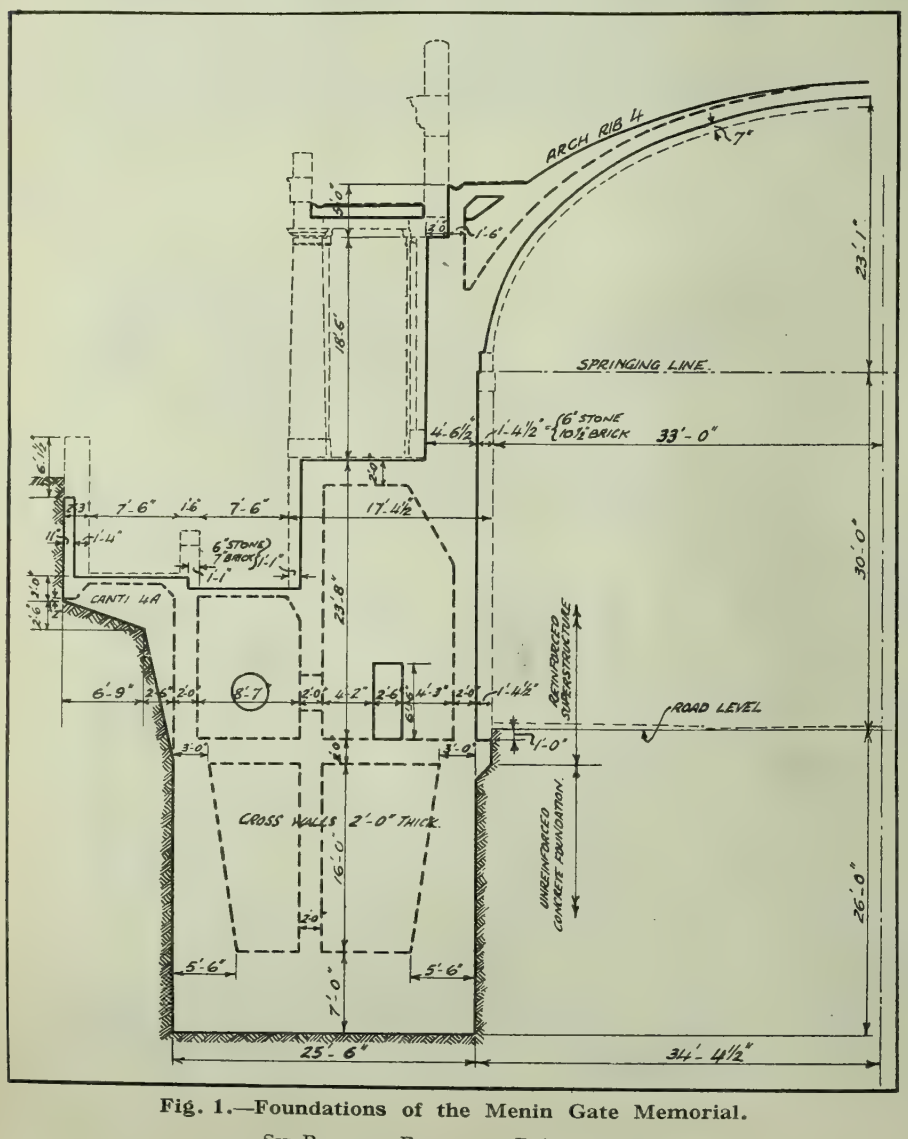

Fig. 1.—Foundations of the Menin Gate Memorial.

SIR REGINALD BLOMFIELD, R.A., Architect.

In the calculations for the arch, the stress due to variations of temperature received careful attention, and the whole structure was designed with a view to permanence, which explains why some of the provisions shown in the figure indicate rather better protection against the effect of stress and weather than might be necessary in a structure of a more temporary nature.

The concrete is to be composed of granite and Rhine sand, and the steel is to be British Standard Specification, although this is, perhaps, unusual in Belgium, the Belgian specification being considerably lower than ours in regard to mild steel.

An interesting feature of the site is the old brick walls to the ramparts, which, as many of your readers will know, project to a considerable height above the road on each side of the gate. What was, perhaps, not so well known was that these rampart walls continued across the road below ground right down to and into the blue clay. These walls are very massive, and were probably designed to resist artillery fire in old time warfare just as much as to act as efficient retaining walls to the earth forming the rampart.

These walls at road level are approximately 10 ft. thick, but are stiffened by massive buttresses at the back of the wall at approximately 16 ft. centres, the total width of the wall at ground level to the back of the buttress being approximately 20 ft. The front of the wall has a batter of approximately 1 in 5 extending right down to the foundations, so that at a depth of about 27 ft. below the road where the walls are founded the overall width over the buttresses is about 25 ft., of which the wall itself amounts to about 15 ft. It is found that this massive brickwork construction crosses the rafts forming the foundations of the new Menin Gate, and after careful examination and repair this brick structure has been taken advantage of for supporting that portion of the raft which comes immediately upon it.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS

Election of Members.

THE following were elected members of the R.I.B.A. at a Business Meeting, held at No. 9 Conduit-street, W.1, on Monday last :—

FELLOWS.

R.I.B.A. EXAMINATIONS, DECEMBER, 1923.—The questions set at the Intermediate and Final (or Special) Examinations held in December, 1923, have been published, and are on sale at the Royal Institute, price 1s. 6d. (exclusive of postage).

THE LATE MR. ARTHUR CLYNE

ON January 6, the death took place at Charlwood House, Charlwood, Surrey, of Mr. Arthur Clyne, architect of Aberdeen.

Mr. Clyne was for many years in business in Aberdeen, first as a partner in the firm of Pirie & Clyne, and latterly for many years by himself. He specialised in ecclesiastical architecture and a number of buildings of the Episcopal Church were designed by him, including St. James's Church at Holborn Junction, Aberdeen, and the church at Drumtochty. He was the architect for a school at Fraserburgh which was destroyed by fire.

He was for ten years president of the Aberdeen Society of Architects, and was a late member of the Council of the R.I.B.A.

In 1914 Mr. Clyne left Aberdeen to reside at Cholmley Lodge.

PRACTICAL DESIGN FOR BUILDING CONSTRUCTION

AN ELEMENTARY EXPLANATION OF THE APPLICATION OF THE THEORY OF CONSTRUCTION TO PRACTICAL DESIGN.

By EWART S. ANDREWS, B.Sc., M.I.Struct.E., A.M.Inst.C.E.

I.—WALLS AND FOUNDATIONS.

The following articles have been written with the hope of explaining to architects and builders the application to practical design of the principles of stress and strain without assuming upon the part of the readers a facility in following the mathematical language almost invariably employed by writers upon the subject. We think that it may be stated as a fact that most men who possess the qualities which draw them to the architectural profession are not proficient in the juggling with symbols which becomes second nature to men who are mathematicians.

Now the theory of construction involves certain essential scientific principles and experimental data which are commonly expressed in mathematical language, and, as architects do not understand that language, they are in danger of failure to appreciate the importance of the principles. Engineers usually have sufficient acquaintance with mathematics to understand the orthodox treatment, and to them the treatment which we shall give here may appear roundabout. At the risk, therefore, of incurring the criticism that our treatment might be made shorter, we propose to express the principles in words, and to illustrate them by diagrams and numerical examples of everyday problems arising in building construction.

In our investigations into various problems we shall have to use the terms "Strength," "Factor of Safety," and "Stability" to a considerable extent, and we must therefore at the outset obtain a clear idea of exactly what they mean.

Strength.

If we made a test of a block of concrete or of brickwork under compression we should find that at a certain load the material would fracture. If we divide this load by the area of the block we obtain a quantity which is called the compressive or crushing strength (sometimes called the ultimate compressive strength) of the material.

In a very important series of tests upon the strength of brick piers made by the R.I.B.A. the crushing load upon a brick pier 6 feet in height and 18 inches square, made of stock bricks with cement mortar (1 to 4), the crushing load was 88.5 tons. The area in square feet of the pier was $\frac{18\times18}{144}=2.25$ sq. ft., so that to obtain the crushing strength we divide 88.5 tons by 2.25 sq. ft., thus obtaining 39.3 tons per square foot. (All our calculations in these articles will be made by the slide rule, which saves a tremendous amount of time, and is quite accurate enough for all practical purposes.)

Factor of Safety.

Now in designing brickwork structures we calculate as nearly as we can the maximum pressure per square foot on the brickwork, and we arrange that this shall not exceed a certain value, which we call the permissible or working stress; in order to determine this working stress we divide the crushing strength by a number called the factor of safety. If, for example, we decide to adopt a factor of safety of 6 for stock bricks (in 1 to 4 cement mortar), we should obtain our working stress by dividing 39.3 by 6, giving 6.5 tons per square foot.

In materials of constant quality, such as steel and concrete made to rigid specification, it is usual to adopt 4 as a standard factor of safety; in other materials we employ a higher factor, according to the variation in quality of parts and workmanship that are likely to occur. Portland cement is now made to a very rigid British Standard Specification, whereas lime is a very variable material; we therefore think it necessary to use a higher factor of safety for brickwork in lime mortar than for brickwork in cement mortar. For the same reason we employ a much higher factor of safety for cast iron than for steel.

We shall treat in greater detail later the strength of brickwork and the importance of the composition of the mortar upon it, but before leaving the question of factor of safety we will point out that different authorities use the term in different senses. If we design a structure with a factor of safety of 4, it does not follow that four times the load actually carried by it will cause fracture. The factor of safety has to cover a multitude of sins; it is partly a factor of ignorance. It is not always possible to calculate exactly what is the maximum stress at a given point caused by a given loading, and, on the other hand, the loads that actually occur are very often much less than those which we take in our calculations. With the advance of knowledge we are able to forecast more accurately than before the stresses that occur, and a building designed to-day with a factor of safety of 4 may be stronger than one designed fifty years ago with a factor of safety of 6. There are still many things about the strength of some very common structures that we do not know, but we are gradually getting away from the condition of affairs some years ago, when a truthful expert was asked how it was that certain very imposing structures withstood their loads, and replied that it was "a combination of the force of habit and the kindness of Providence."

Stability.

We shall not use the word stability in quite the same sense as strength; but will use stability to indicate resistance to overturning as a whole. A wall may be strong enough in itself, but it may be unstable because it tends to overturn; this overturning may depend upon the soil upon

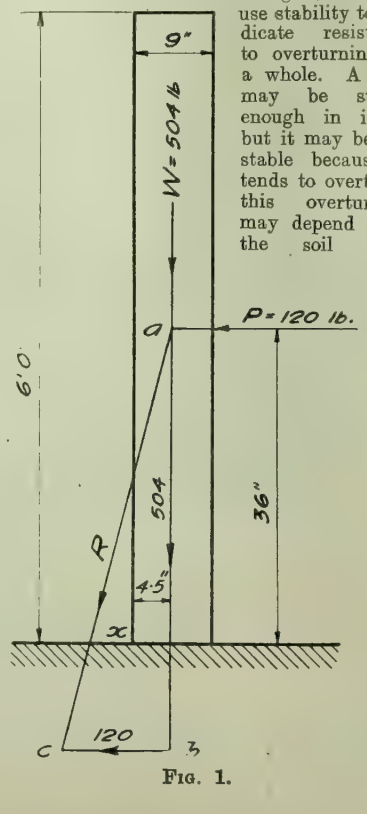

FIG. 1.

which it is placed. It might not turn over a very hard bed, but might do so by fi canting over and sinking into a soft bed.

As a simple example, take the case of 9-inch wall 6 feet high to a horizontal wi pressure of 20 lb. per square foot.

In all problems of this kind we consider t stability of a one-foot length of the wall, a in this case the forces acting on a foot len are as follows:—

(*a*) The weight W of the wall = 6×8 504 lb. (taking 9 in. brickwork as weigh 84 lb. per foot super.), which acts vertica down the centre line of the wall, as indica in Fig. 1.

(*b*) The wind pressure P = 6×20 = 120 (since the pressure is 20 lb. per square foo The wind pressure is assumed uniformly d tributed over the depth of the wall, so take 120 lb. as acting horizontally at the m height of the wall.

There are two simple methods of testi the stability of a simple structure of t kind:—

(1) To find the resultant of all the for acting upon the structure, and find where line of action of this resultant force interse the plane of the base; if this line falls ins the base, the structure is stable, but if it f outside it is unstable.

In the present case we proceed by find the point *a* at which the line of the w pressure P intersects the line of action of weight W of the wall. We then set down length *a b* vertically to a convenient scale represent 504 lb.—the value of W.

We next set out the line *b c* horizontal to represent to the same scale 120 lb.— value of P.

We then join *a c* which represents to sc the resultant force R on the wall and is of called the line of pressure; some people c it the equilibrium line. In this case the l of pressure comes outside the base, and so say that the wall is unstable.

(2) By considering the point *x* about wh the wall tends to turn and seeing whether leverage (or moment as it is called in t branch of dynamics) about this point of forces tending to overturn the structure greater or less than the moment of the for tending to keep the wall stable.

The pressure P is the only force in t case tending to overturn the wall, and moment about the point *x* is measured pound-inches by multiplying 120 lb. (the va of the force) by 36 in. (the "arm" of force, that is the perpendicular distance fr the point *x* to the line of action of the pr sure P).

This gives us:

Overturning moment = 120×36
= 4320 lb.-in.

The force tending to keep the wall stable the weight W, the moment of which ab the point *x* is obtained by multiplying 504 by 4.5 in.

This gives us:

Stability moment = 504×4.5
= 2268 lb.-in.

This is less than the overturning mom so that we say that the wall is not stable

In masonry structures built up of blo it is a general rule that the adhesive ten of the mortar shall not be relied upon securing stability, and so we say that above wall is unstable in spite of the fact t walls of this dimension can be found wh manage to stand up. We will consider l how we could allow for the adhesion of mortar if it were decided that it is safe.

In practice such a wall may never h had such a pressure due to wind as we h assumed, although the value which we h taken is less than that usually specified; m over, cross-walls and counterforts would to the stability.

THE BUILDING TRADE.

THE COST OF BUILDING.

By T. P. BENNETT, F.R.I.B.A., Hon. F.I.O.B.

THE following is the conclusion of the series articles on *The Builder* Cost of Building ompetition. Other articles appeared in our sues for December 7 and 14, 1923:—

The study of the forms giving the cost of aterials is interesting, firstly, because it ows a certain stability in the cost of most aterials, and secondly, because the varia-ons in cost seem to have little or no relation the completed tender. If reference is made the chart already reproduced it will be en that bricks and cement, while showing rtain fluctuations in price, produce graphs at are horizontal in character, and do not se and fall with the graph of tenders repro-ced below it. In both graphs the position of e relative tenders is the same. Lime shows rhaps rather greater movement than cement, might be expected from the fact that it produced locally, and is not subject to the ntrolling influence of the cement interests. ne items which vary most in the schedule e those relating to goods which are rmally given as p.c. items, as indicated the graph for the kitchen range reproduced December 14. It is natural that these ices should show marked differences because the opportunity for variation in quality and ish, but this would hardly seem to account r the very large differences which are ap-rent. The requirements of cottages have w become well known, and in the ordinary ay it would seem natural to expect that the pe of range, bath, w.c., etc., would have came standardised. **Again, it will be seen** at the cost of these items has little in-ence upon the final tender.

In the case of the range specified for type " the extreme prices are rather surprising cause they extend from £3 to £20. It is ficult to imagine that an efficient 3 ft. grate be obtained for £3. The range supplied the winner was priced at £10 10s. £20 ms an unnecessary extravagance, and one which few builders would be guilty.

The materials scheduled by the winners were be obtained locally, with the following ex-tions:—Bitumen, Wm. Briggs & Sons, d., Dundee; gas copper and boiler, Rown-, Drew & Clydesdale, Ltd., London; tiles, wkesbury & Bedworth Brick and Tile Co., dworth; stoneware pipes, Kendrick, Wel-rton, Salop; manhole covers, Hatton, Sons Bore, West Bromwich; bricks, Willenhall ick Co., Willenhall.

The result of a close examination of the ces of materials is to suggest that there e differences in different localities, and that ere is ample scope for good buying, but any in under these headings is a means of pro-ling a margin of profit for the builder her than a matter of substantially reducing cost of the building.

After examining the cost of materials in njunction with the tenders the conclusion ived at is that the following are the chief ses in determining the level of the final ce:—

(1) The standard of workmanship.
(2) The efficiency of labour and manage-nt.
(3) The amount of the allowance for over-d charges and profit.

Under (1) there can be no doubt that the lity of the work put into a small house susceptible to very big differences, and that all probability the kind of house that would built for the amount of the highest tender ,158 15s. 5d.) would be very different from t which would be built for the lowest. smuch as it is very difficult to lay down an exact permissible quality the standard allowed becomes a matter of judgment upon the part of the architect, and of the reputation of the building firm concerned. The lowering of the standard of the building is undoubtedly the principal reason why speculative houses are sometimes cheaper than those designed for the personal occupation of a client, and also one of the reasons why Council houses erected by unknown builders can sometimes be quoted in the press at quite impossibly low figures.

(2) Many of the differences in price arise from the efficiency of the firm and of their workmen. Where, as happens in some cases, employees are kept on from year to year, and especially where they in some way share the prosperity of their employers, it is reasonable to anticipate that there is an improvement in their output. Similarly, when most or all the operatives are skilled craftsmen, they not only produce better work but they work much faster. This increased efficiency is probably the reason for the somewhat curious fact that all the lowest tenders except one were from districts where the highest rates for labour are paid. This means that, broadly speaking, the good men migrate to the well-paid districts, and that one result of their skill is the production of work that is more economical than that of the duller and slower men who remain behind. Incidentally it should be a powerful factor in inducing employers to take a keen interest in the training of apprentices. It must, however, be borne in mind that " A " grade towns in general have much better facilities for the supply of materials than is the case in country districts. Management in building as in all other types of business is, of course, an important factor, but is again one which, while it is a source of profit to the builder, and enables him to take on work at a low price without loss, does not substantially lower the cost of building.

(3) Allowances for overhead charges must of necessity vary with the size of the firm executing the work and the amount of the profit. On the other hand a substantial business implies better buying facilities and more intelligent management and organisation. These factors are of relatively greater importance on a large than on a small contract, and consequently they become an important asset in reducing the cost of big works, but possibly do not have full scope on small ones.

A specific query was sent to the builders who sent the 30 lowest tenders, with the following questionnaire:—

1. Did the issue of bills of quantities cause an increase in the tender?
2. What variations in accordance with local practice would have reduced the cost?
3. What other modifications would you suggest in the design or specification with a view to reduction in the cost?
4. Do you consider the accommodation provided suitable for working-class houses in your district?

Thirteen builders have replied up to date, and in answer to query (1) six replies state that quantities do increase the tenders, and have done so in this case, and six state that quantities do not increase the tender, while one makes no reference to the question at all. There appears to be nothing to confine the above decisions to any one class of builder or locality; but although quantities must save the builder a certain amount of work it is safe to assume that there is some ground for the belief that quantities cause higher tenders on small work.

In answer to questions (2) and (3) the following are the most important suggestions made:—

TYPE " A " HOUSE.

Omit inodorous felt and roof boarding.

Half-brick manholes. Omit curb. Use half salt-glazed channels in lieu of three-quarters white.

Wood boarded or granolithic floor in lieu of tiles.

Omit roof boards and batten roofs only.

Use ⅞ in. floor in lieu of 1 in., and omit mitred borders to hearths.

Omit part of shelving, all pipe grounds and drawers to cupboards.

Use R.W. strength instead of L.C.C. for waste pipes.

12 COMPETITORS IN " COST OF BUILDING " COMPETITION.

Class " A."

	No.	Name.	Town.	Amount.
Prize	**47**	**William Roe**	**Wolverhampton**	**£1,195 11 4**
1	117	Robinson & Sons	Swannington	1,122 18 0
2	145	Shilton & Co., Ltd.	Coventry	1,127 10 6
3	120	P. C. Sayer	Witham	1,144 12 7½
4	119	R. A. Evans & Co., Ltd.	Lowestoft	1,177 19 2½
5	40	A. Sanders & Sons	Exhall	1,188 6 9
6	161	J. G. Richmond	Darlington	1,194 4 11½
7	95	T. Mortlock & Son	Willingham	1,200 0 0½
8	138	A. Anderson	Newcastle-on-Tyne	1,215 6 0½
9	107	Stephen Heath & Son	Newcastle, Staffs.	1,241 13 5½
10	67	S. S. Ambrose & Son	Ely	1,246 6 4½
11	147	I. G. Richards	London	1,249 18 11½
12	162	H. Cooper	Maltby	1,254 8 5

Class " B."

	No.	Name.	Town.	Amount.
Prize	**145**	**Shilton & Co., Ltd.**	**Coventry**	**£1,560 10 7**
1	21	Newcombe & Co.	Cardiff	1,599 9 2
2	162	H. Cooper	Maltby	1,607 2 2
3	119	R. A. Evans & Co., Ltd.	Lowestoft	1,621 10 8
4	161	J. G. Richmond	Darlington	1,621 12 9
5	47	William Roe	Wolverhampton	1,623 7 8
6	120	P. C. Sayer	Witham	1,625 16 9½
7	147	I. G. Richards	London	1,658 17 6½
8	107	Stephen Heath & Son	Newcastle, Staffs.	1,661 3 7
9	122	G. & J. Browell	Blaydon	1,667 2 1½
10	117	Robinson & Sons	Swannington	1,677 2 0
11	34	W. J. B. Halls	Gloucester	1,693 5 5
12	67	S. S. Ambrose & Son	Ely	1,713 10 11½

Omit all hot water work and lavatory basins.

Replan first floor and put bath in scullery and so save bathroom.

TYPE "B" HOUSE.

Use 3 in. surface concrete in lieu of 4 in. and 5 in.

Corbelling to manhole in lieu of concrete slab.

3½ in. by 2 in. in lieu of 4 in. by 2 in. rafters.

3½ in. by 2 in. in lieu of 5 in. by 2 in. ceiling joists.

1½ in. by 1 in. battens in lieu of feather edge boarding.

Reduce overhang of eaves from 15 in. to 9 in.

Reduce casements from 2 in. to 1¾ in.

Two-inch internal breeze partition in lieu of 3 in.

Omit hot water.

Omit plaster panels and trellis.

A number of competitors raised most of the points mentioned.

In particular, Mr. J. G. Richards, of 15, Ladbroke-square, London, W. 11, Mr. J. A. Davison, of West Malling, Kent, and Messrs. Shilton & Co., Ltd., of Little Heath, Poleshill, Coventry, sent very carefully considered replies.

Others, notably Messrs. Bunn & Green, of Berkhampstead, Herts, and Messrs. Green & Bird, of West Hill, Hednesford, Stafford, have given the matter much consideration, but had fewer comments to make.

Many replies considered the type of house called Type "A" quite suitable in the districts of the writers; several, however, thought them superior to others in the district, and many commented upon the need or modifications to reduce cost. Type "B" was considered generally to be too large.

As to drastic reductions in cost these can only be made by the substitution of semi-permanent for more solid construction, as, for example, the use of No. 2—3 in. breeze slabs with iron ties for 11 in. hollow brick walling, which would probably save £50 per house or £100 for the pair. "Eternit" slating for tiles would save about £20, and still leave quite a habitable building.

The important points which arise from this competition and its results may, therefore, be summarised as follows:—

1. Economical design is of the utmost importance.

2. Housing enthusiasts are still endeavouring to demand a standard of accommodation far in advance of that which a working man can afford, and that in order to build with a view to creating an economic rent the amount of accommodation must be substantially reduced.

3. That the lowest possible price at which substantially built cottages can be erected at the present time is from 10½d. to 11½d. per cubic foot.

4. That this translated into floor area should be about 11s. to 11s. 6d.

5. That these prices are only possible with the strictest possible economy and with low tendering, and on an average will probably be 11d. to 1s. 1d.

6. That a semi-detached house containing a living-room, scullery, sitting-room, three bedrooms, and bathroom will cost at least £595, if solidly constructed in brick with a tiled roof.

7. That a house containing two sitting-rooms, kitchen, scullery, four bedrooms and bathroom will cost at least £777.

8. That in practice these figures may quite easily be exceeded since practically all the tenders are above these amounts, and would show on an average prices of £650-£700 and £825-£875 10s. respectively.

9. That no district in the country shows any marked economy compared with other districts, and that it is as dear to build in the provinces as in London.

10. That towns paying "A" grade wages can build as cheaply as those paying lower wages, because the best men tend to migrate there and because the "A" towns have a much better market for the supply of materials, while haulage is less, and overhead expenses may be proportionately less.

11. That clerical errors are very prevalent and often serious in building tenders.

12. That nearly 75% of the cost of a building is absorbed by the "Bricklayer," "Carpenter," "Plumber," "Painter," and "Glazier."

13. That the greatest variations in price occur in these trades with an emphasis upon the "Carpenter."

14. That the carcassing of these houses accounts for about 88%, and of the most economical cottage imaginable 92% of the entire cost, and that these items are quite unalterable without abandoning the principle of building a permanent fire-resisting structure.

15. That the price of materials is fairly steady, and while affecting the general level of building costs is not the primary cause of variation in the amount of the tenders for an individual building.

16. That prime cost items vary substantially.

17. That probably the efficiency of the workman and the standard of the work are the principal factors in determining the relative cost of buildings.

18. That bills of quantities probably tend to increase tenders for small houses.

19. That houses can only be built at amounts substantially below the figures quoted if they are of a semi-permanent or temporary character.

These results are of considerable importance to the study of building costs, and there can be no doubt that *The Builder* competition has added very materially to an accurate appreciation of the present cost of building, a result upon which the promoters (Messrs. Rownson, Drew & Clydesdale, Ltd., 225, Upper Thames-street, E.C., and *The Builder*) deserve the thanks of the whole industry.

Models of the designs have been made for *The Builder*, and at the present time can be seen at the showrooms of Messrs. Parsons, and already houses are being erected from the architects' designs, under their supervision.

In the lists on page 77 are given the amounts of the tenders of the winners, after adjustment for clerical errors, and the amounts of the twelve nearest competitors in each competition without such adjustment.

Geysers Without Ventilation.

Recently two inquest verdicts of death from poisoning by carbon monoxide, through a window being closed while a person was having a bath in which a geyser was being used, were returned. These made five or six deaths from the same cause that had occurred in Bristol recently. The Bristol Medical Officer of Health recently strongly recommended means of ventilation which would operate mechanically when a geyser was was in use.

COMPARISON OF PRICES OF BUILDING MATERIALS IN JANUARY, 1923, WITH CURRENT PRICES.

WE again have pleasure in publishing a table giving the prices of the principal building materials at the present time as compared with the prices for January, 1923. We are glad to say that there has been a steady fall in nearly all the markets.

Material.	£ s. d. Jan., 1923.	£ s. d. Jan., 1924.	% Fall.	% Rise.
Bricks—				
Best Stocks	4 2 0	3 19 0	3.66	—

REINFORCED CONCRETE GRAIN SILOS AT AVONMOUTH.

THESE silos were erected by the Co-operative Wholesale Society's Building Department, London, to the design of their architect for the Southern District (Mr. L. G. Ekins, F.R.I.B.A.).

The building is practically square on plan, the dimensions being 93 ft. 3½ in. by 92 ft. 7 in., and has a storage capacity of 447,000 bushels (13,000 tons) of grain. The height from ground level to roof is 132 ft. 6 in., and above this a tower extends for a further 16 ft., making the total height 148 ft. 6 in. A sprinkler tank of 20,000 gallons capacity is contained in the tower. The height of this building will be realised when it is remembered that the height of the Nelson Column in Trafalgar-square is 150 ft.

All grain is moved by belt conveyors and elevators, supplied by Messrs. Spencer & Co., of Melksham, Wilts; the milling plant is being supplied by Messrs. Robinson & Sons, Rochdale.

As the ground was too soft to carry the loads required, all the foundations were carried by 14 in. by 14 in. by 55 ft. reinforced concrete piles, which were driven to a set of from ½ in. to 1½ in. in ten blows, and were calculated to have a carrying capacity of 50 tons per pile. In all 575 of these piles were driven, in groups varying from four to twelve. The soft nature of the ground will be evident from the fact that the result of the pile-driving was to raise the level of the site and adjoining land by 2 ft. Very little difficulty was experienced in the driving, as all piles took their set at practically the same depth. The heads of the piles were broken up and a reinforced concrete cap cast round each group to form a base for the reinforced concrete columns supporting the structure. The space between the caps is covered by a 6 in. reinforced concrete floor.

All interior columns are octagonal to bin-bottom level, whilst the face of the external columns project beyond the external walls in conformity with the architect's requirements. It was decided to make the underside of the bin-bottoms level so as to minimise the cost of centering.

The bins are 60 in number, the dimensions of 36 being 11 ft. 9 in. by 12 ft. 6 in., centre to centre of walls; while the remaining 24 are 5 ft. 10½ in. by 7 ft. 8¼ in. centre to centre. The walls of the larger bins are 7 in. thick throughout; and those of the smaller bins, 5 in. Each bin is 100 ft. in depth from top to bottom.

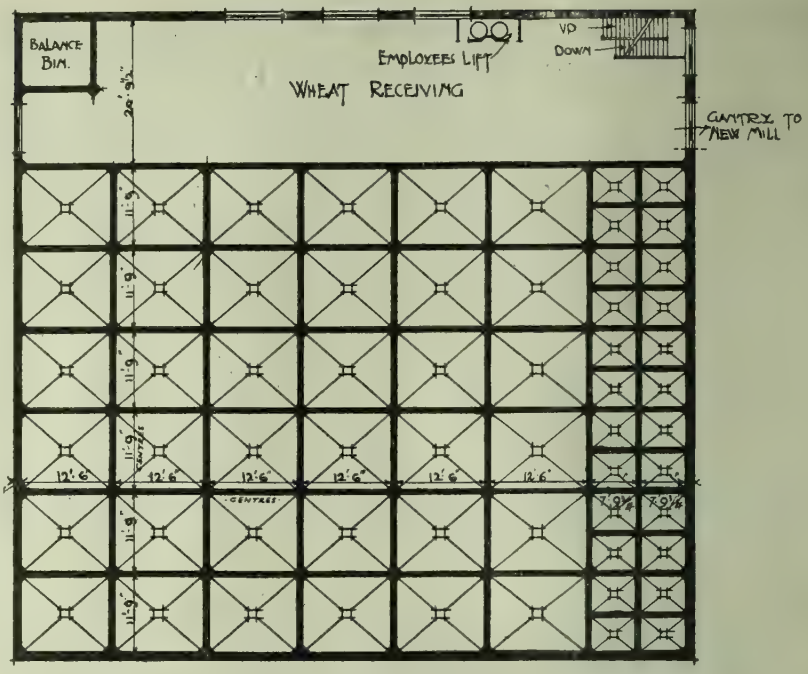
Wooden centering was used throughout, the forms being raised as the work proceeded. All mixing of concrete was done by mechanical means, and the mixture was hoisted up an "Insley" steel mast hoist and fed by gravity to the position required. The concrete for the columns below the bins is a 1 : 1 : 2 mixture; while a 1 : 2 : 4 mixture was used for the columns above the bottoms of the bins.

The bin tops are covered with reinforced concrete slabs, 6 in. thick, which form the bandway floor. An opening 2 ft. square is left

Reinforced Concrete Grain Silos at Avonmouth. MR. L. G. EKINS, F.R.I.B.A., Architect.

in the top of each large bin, and 1 ft. 6 in. square in each small bin. Belt conveyors carry the grain over the floor to the bins.

This floor is covered by a reinforced concrete roof, which extends over the whole building, light being provided by three large lantern lights. A covering of asphalte is given to the roof, and falls are obtained by varying the height of columns as necessary.



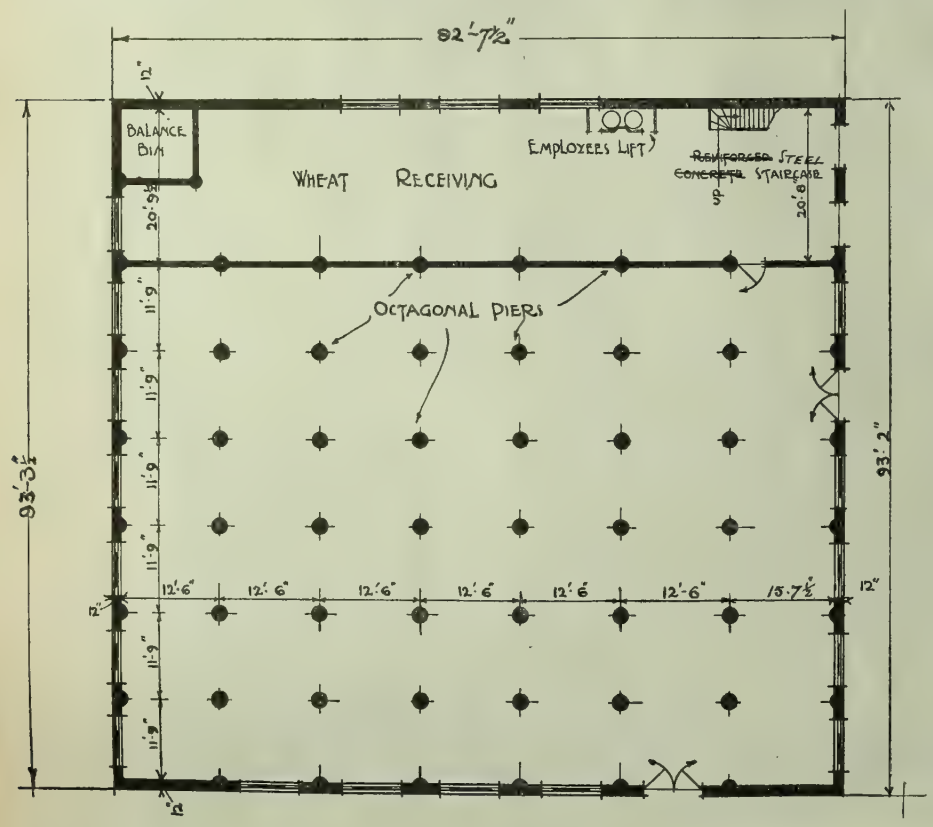
The east end of the building holds the elevators and milling machinery, carried on reinforced concrete floors. Elevator rooms are provided at the north-east and south-east ends of the building to carry the hoisting machinery; whilst a large balance bin occupies the north-east corner from the ground level to the fourth-floor level. A smaller balance bin occupies the south-east corner from the fourth to the bandway floor level.

External walls are in reinforced concrete, 7 in. thick, panelled on the external face. The wall surfaces are finished without any skimming coat of cement and sand, and are left as from the shuttering.

All steel is to British standard specification, and consists of round bars of mild steel.

A tunnel extends from the railway siding to the underside of the elevators to carry the belt conveyor, which conveys grain from trucks to the bins. This tunnel is 229 ft. 2 in. in length, 7 ft. wide, and 7 ft. 3 in. in height, and is supported by 21 piles, 14 in. by 14 in. by 50 ft.

The whole of the reinforced concrete work for this structure, which comprises the main grain store in connection with the Co-operative Wholesale Society's large flour mill adjoining, was designed by Messrs. Edmond Coignet, Ltd., reinforced concrete engineers, of 125, Gower-street, W.C. 1.



PLAN THROUGH SILOS.

Messrs. Hartley & Sugden are opening on February 1, 1924, new offices and extensive showrooms at 215, Tottenham Court-road, London, W. 1 (telephone, Museum 214), and will have at these premises a most extensive range of boilers, heating applicnces, and "Thermostoves." The general public, also the trade, are invited to call and make an inspection.

STAFF DINNER.

"A HAPPY New Year party" is perhaps the best description of the annual dinner of Messrs. A. Roberts & Co., Ltd., builders, of Earl's Court-road, Kensington, held at the Café Royal, Regent-street, on Thursday last week. This firm is justly proud of the cordial relations which exist between the directors, the staff, and the employees, and if, as we have no reason to doubt, the good fellowship between all concerned so much in evidence on this occasion is present throughout the everyday routine of office and job, the firm is indeed to be congratulated. Mr. G. S. Roberts, who occupied the chair, likened the firm to a guild in which capital and labour formed a brotherhood for the betterment of the craft and the provision of good buildings, and Mr. M. C. Doll, M.A., A.R.I.B.A., testified to the success accompanying work carried out on this principle by describing the excellent workmanship put into some recent buildings carried out by the firm; he had, he said, always found the operatives most interested in their work, and anxious to give of their best. Mr. E. J. Brown (Director of the London Master Builders' Association) also referred to the spirit of co-partnership which existed throughout the firm, and pointed out that it was only by trying to see "the other fellow's point of view" that difficulties could be understood and remedied. Mr. H. W. Capper, Mr. F. E. Nunnerley, Mr. A. Roberts, Mr. A. J. H. Sprague, F.S.I., Mr. M. V. Ely, and Mr. P. Roberts also spoke between the items in an excellent after-dinner musical programme.

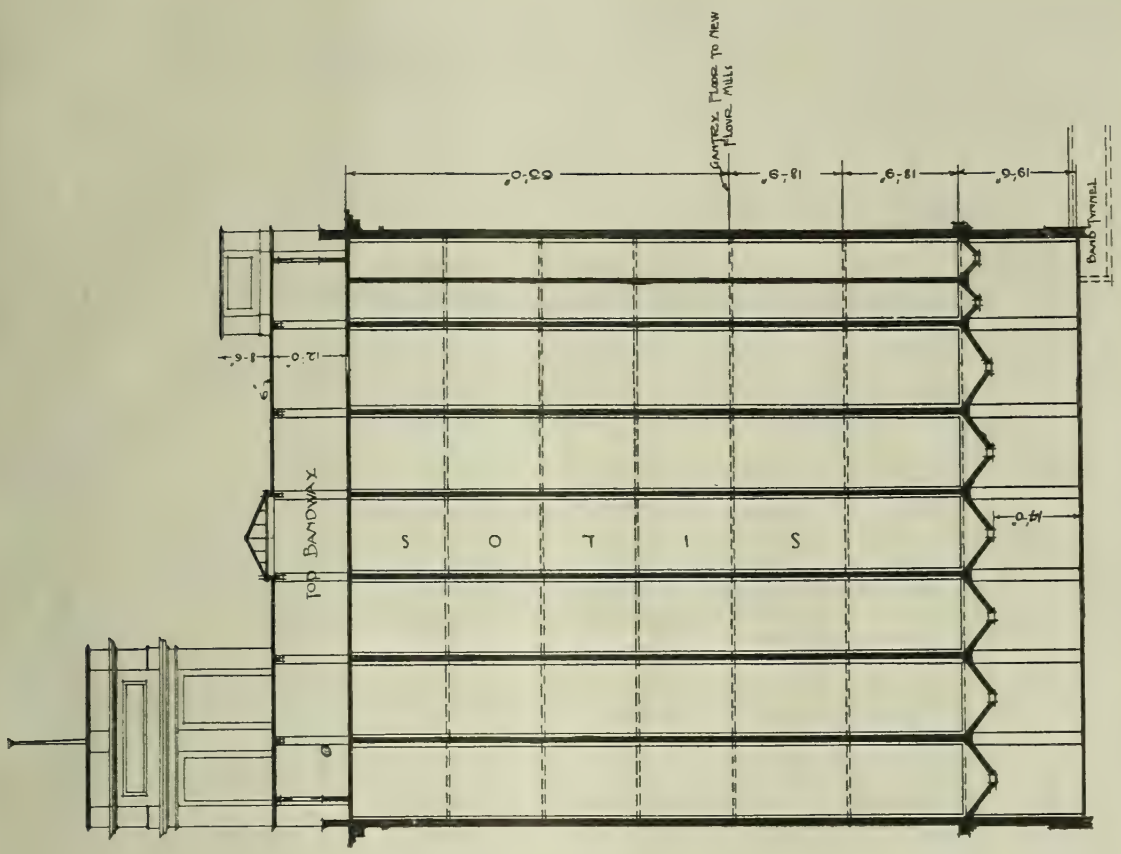
GROUND FLOOR PLAN.

Reinforced Concrete Grain Silos at Avonmouth. MR. L. G. EKINS, F.R.I.B.A., Architect.

OBITUARY.

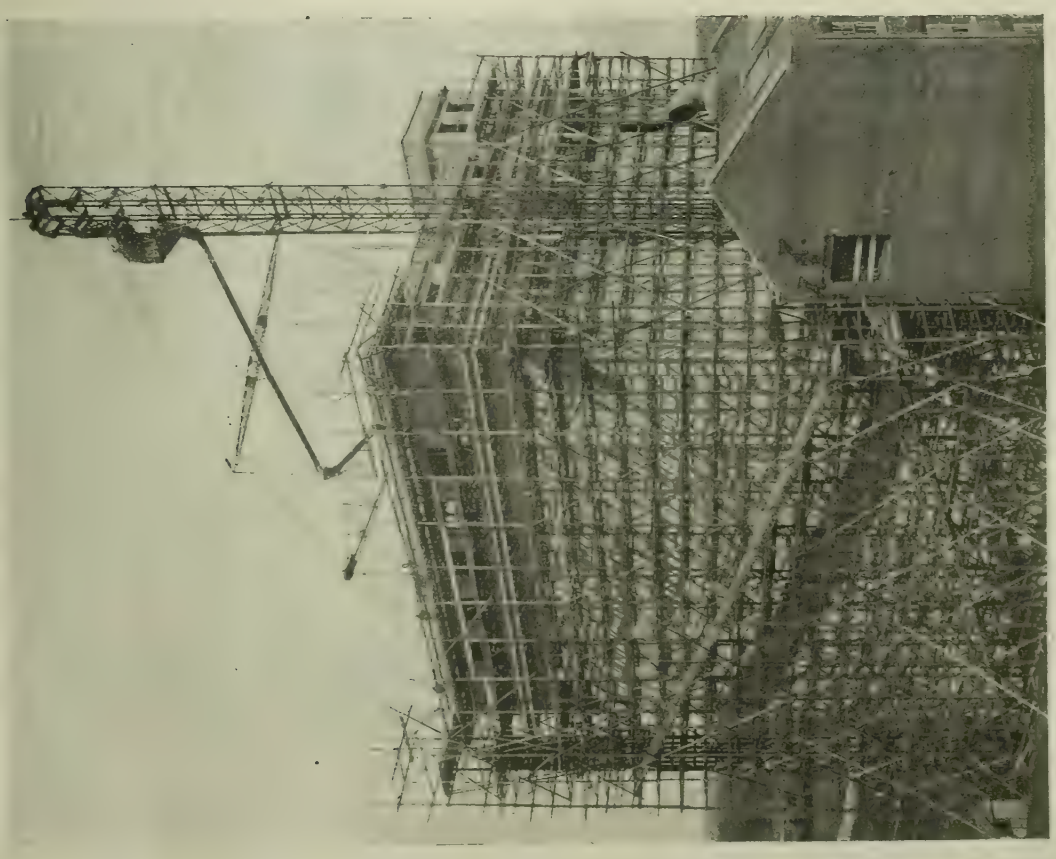
The death occurred recently at Ilfracombe, of Mr. Oswald M. Prouse, A.M.I.C.E., for 32 years engineer and surveyor to the Ilfracombe Urban District Council.

The death occurred at Weldon House, Barnard Castle, on December 25, of Mr. Wm. Appleby, aged 81 years, a retired builder and contractor.



Mr. Donald M. King, joint managing director of Messrs. David King & Sons, Ltd., of Keppoch Iron Works, Possilpark, Glasgow, died suddenly at his residence on December 22 last. Mr. King had been associated with the firm from its inception in 1874, when the business was first established by Mr. David King, senr., and John King, J.P. (now Chairman of the National Light Castings' Association).

The death has occurred of Councillor Arthur F. Young, aged 68, who, prior to his retirement eight years ago, carried on for many years the business of a builder. Councillor Young was Mayor of Sunderland for the two years, 1908-10, a borough magistrate, and a director of the Sunderland Industrial and Provident Building Society.



The death has taken place of Mr. John George Sayce, builder and contractor, Newport (Mon).

An Epstein Exhibition.

An exhibition of new sculpture by Jacob Epstein will be held during this month at the Leicester Galleries, Leicester-square.

ADVANTAGES OF THE NEW STEEL JOISTS.

By M. B. BUXTON, M.A.

THERE are at the present moment a vast number of schemes for the building of factories, offices, and flats which have never been actually commenced owing to the fact that the cost has not been brought down to what the promoters consider a paying proposition. The problem of lowering the cost of building materials and construction is of great importance, not merely in order to benefit those who wish to use the buildings when completed, but in order to alleviate to some degree the great amount of unemployment at the present time by profitably employing capital, brains, and labour in the promotion of commercial enterprises.

We have really to learn to make the best use of what we have at our disposal, and since in every large scheme steelwork plays an important part it is well that we should see if there are not means which could be used, and which in fact are being used by the more progressive architects and engineers to reduce the cost of work.

At the moment there is a very large selection of steel joists available, those of British Standard Specification 1904 range being still in use, while the New British Standard sections which were standardised in 1920 are now available. It is the latter sections which can help to a great extent at the moment to lessen the cost of building construction. A superficial glance at a list of the new sections and comparison with the old may not lead to any great appreciation of their value. But if the question be carefully studied we shall discover some surprising facts. In these sections we have a far better range of strengths of weights and shapes to carry the loads met with in ordinary building practice.

The metal in the section is placed to the greatest advantage in accordance with the latest ascertained scientific principles as far from the neutral axis of the beam as is practicable. Take, for instance, a joist weighing 30 lb. per ft. run: The problem is to so arrange the metal that we have the greatest load carried and yet a web stiff enough to resist the shear stresses. The old range gives us the 10 in. by 5 in. at 30 lb., which has a modulus of section, or measure of strength, of 29.12 in.^{3}, and can carry a distributed load of 7.2 tons on a span of 20 ft. with a factor of safety of 4. On the other hand, the new range of sections has a beam weighing 30 lb. per ft. of section 12 in. by 5 in., which has a modulus of section of 34.48 in.^{3} and can carry 8.6 tons distributed on a 20 ft. span. Thus for the same cost of metal we have a beam which is about 16 per cent. stronger.

Certain people are misled by seeing that some new sections are of similar weight and dimensions as the old, *e.g.*, 6 in. by 3 in. at 12 lb., 8 in. by 6 in. at 35 lb., 9 in. by 4 in. at 21 lb. In every case closer examination reveals a better disposition of the metal, with a proportional increase of strength.

There is also a far better range to choose from than in the old list of sections. In the latter the weights and moduli of section seemed to be haphazard, and we find joists weighing 28, 32, 35, 42 lb., for example. In the new the joists increase in weight by 5 lb. from 20 to 90 lb., so we have joists weighing 25, 30, 35 lb., etc., with moduli increasing gradually and in more regular series. Incidentally it is clear that the weights, being in multiples of 5, much labour is saved in arriving at the weight of steel when estimating.

There are also some most excellent new forms of section, the 13 in. by 5 in. at 35 lb., the 18 in. by 6 in. at 55 lb., and the 20 in. by 6½ in. at 65 lb., to cite a few examples. If, for instance, a beam to support a load of 23 tons on a span of 20 ft. with a factor of safety of 4 is required, a modulus of 92 in.^{3} is necessary. The choice would be between, in the old list, either a 16 in. by 6 in. at 62 lb., which only supports 22 tons, and so is really too weak, or an 18 in. by 7 in. at 75 lb., which is too strong. In the new range we have a beam of modulus 93.5 in.^{3}, viz., 18 in. by 6 in., able to take slightly more than 23 tons, and only weighing 55 lb. as against 62 or 75 lb.

Looking at the list of old sections to see if we have a beam of about 55 lb. weight, we find one of 54 lb., the 12 in. by 6 in., and on calculating its carrying capacity on a span of 20 ft., we find it will only take 15 tons. So by utilising the 18 in. by 6 in. we have a clear gain of almost 35 per cent. in strength, weight for weight, through the more scientific disposition of the metal.

It is apparent that we have similar results when the new joists are used as compounds with plates riveted to the flanges. We find compound girders able to bear the loads with the required factor of safety weighing less than those made from the old sections.

We have so far confined our attention to joists used as beams. As to pillars or stanchions, suffice it to say that we have a wider range of heavy beams or pillars from which to make our selection, with the metal disposed in such a manner as to give a greater radius of gyration in the weaker axis. Many are of deeper section, as 12 in. by 8 in. at 65 lb., 14 in. by 8 in. at 70 lb., 16 in. by 8 in. at 75 lb., and so afford more space in the webs and on the flanges for connections of girders bearing upon them, thereby affording opportunities for economical design.

If anyone will take the trouble to compare a handbook giving carrying capacities of the old joists with a handbook giving those of the new joists he will find that these few examples discussed here will be multiplied considerably.

The important question will naturally occur in the reader's mind as to whether these new sections rolled are available for general use. Joists are made from the steel ingots by gradually rolling them first in a cogging mill and then in a finishing mill into the finished dimensions. The finishing mill really resembles in principle the well-known household mangle, the steel being squeezed between two rollers on which the profile grooves are made, so that the shape of the section required is produced. It can be readily understood that these rolls will gradually wear or may possibly be broken, so that new rolls are required. The steel manufacturers have agreed that as the rolls of the old sections wear out rolls to replace them will be cut to the profile and dimensions of the new sections.

Almost every steelworks now rolls some of the new sections, and one large works has an almost complete range of them. Therefore there is no difficulty in purchasing the majority of them, and they are constantly now being utilised by architects and engineers, who are fully alive to the need of having the most efficient and economical scheme of steelwork for their buildings and factories.

Proposed Rural Libraries.

It is proposed to found several rural libraries in the North Riding area, and the E.C. have been instructed to prepare and submit a scheme for the adoption of the Public Libraries Acts 1892–1919, and application be made to the Carnegie Trustees of a grant.

INSTITUTE OF BRITISH DECORATORS.

"Fresco Painting."

MR. J. H. SEXTON gave a lecture on this subject at Painters' Hall, Little Trinity-lane, E.C., recently.

In the course of his remarks he said that fresco painting comprised one of the oldest forms of mural decoration. Certain forms of fresco were used by the Egyptians in their tombsin prehistoric times; Prof. Flinders Petrie put the date at from 8,000 to 5,800 B.C., and wall paintings discovered during excavations at the Palace of Knossos, on the Island of Crete, probably dated from about 1,500 B.C., but the greater development of the art began in Italy in the thirteenth century.

The Italians, however, increased its scope and possibilities; and it gained significance from the fact that it was more permanent than tempera or oil painting.

There were, the lecturer said, three processes of fresco painting: Buon, Secco, and Spirit. The first consisted of painting, whilst the plaster was still wet, with simple colours; the second painting after the plaster had been allowed to dry: it was similar to tempera painting. The third was an altogether different process, and consisted of the work being done on a specially prepared ground when it was dry, with material of which resin and white wax were essential ingredients.

Theorists differed as to the composition of buon fresco; according to some authorities the lime should have been slaked at least a year before using, and the proportions of lime and sand half and half. Cennino Cennini, however, made no such stipulation, and merely stated that if the lime were very fresh and rich it would require two parts of sand to one of lime ground well together with water, and allowed to rest for some days until it was quite slaked.

Together with the necessity for having the lime well tempered, it was essential to have the right kind of sand—river sand.

The lecturer then said that simplicity in colouring and design was the chief thing to be aimed at.

It was stated when Michael Angelo was at work on the ceiling of the Sistine Chapel he was very much upset at the various changes the fresco underwent, in succession, when drying. He asked the Pope to be allowed to resign from his work, but he was referred to San Gallo, who explained the matter to him.

The necessity of working with freshly-made plaster must not be overlooked; also colours appeared much lighter in the process of drying, and the work must not be continued after crystallisation had once commenced. It was the practice in the sixteenth century, when a fresco had been commenced but not completed the same day, to finish it in secco fresco with size or egg medium.

The colours used in buon fresco painting were chiefly simple earths. The lecturer gave a list as follows: White, lime-white that had been kept for a long time; yellow, all kinds of ochres and red siennas; reds, all kinds of burnt ochres, burnt sienna, oxides of iron, and lake coloured burnt vitriol; browns, umber raw and burnt, and burnt terre verte; black, burnt cologne-earth; purples, burnt vitriol, cobalt blue and lake-coloured burnt vitriol; greens, verona green (terre verte), cobalt and chrome green; blues, ultramarine, cobalt blue and factitious ultramarine (this did not always mix well).

Vasari, in "Lives of the Painters," spoke of the qualifications most requisite to obtain success in buon fresco. They were dexterity, resolution and rapidity, combined with sound and perfect judgment; this judgment played an even more important part than drawing. Much practice was necessary as a guide, and it was extremely difficult to bring fresco work to perfection.

Cleanliness in working was very necessary, and brushes, &c., should be washed with turpentine at the end of the day.

MODERN BUILDERS' MACHINERY.

By STAFFORD RANSOME.

I.—THE BUILDER AS A USER OF MACHINERY.

FROM the days when mechanical wood conversion began to rank as a commercial, or rather as an industrial, proposition, which may be put at about 150 years ago, the builder has been the best, if not the largest, customer of the manufacturers of woodworking machinery.

I say that he is the best customer for two reasons. First, he is the steadiest; he is always there and he is always growing individually and collectively. The small man becomes a big man, or perishes in the attempt, and his number is ever multiplying. Almost from the start he must have machinery of some sort—even if it is only a mortar mill, a saw bench, or a "general joiner." And a builder's plant may mean anything from a single machine up to a saw-mill and joiner's shop of very considerable size and of a peculiarly all-round capacity, even sometimes to the conversion of large logs of all sizes and qualities of woods. It is the multiplicity of these establishments, large and small, throughout every civilised country in the world, and the fact that builders, as a rule, work their machines very hard, that makes the demand for their requirements at once very large and constant.

A Direct Customer.

The second reason why the builder is welcomed of the manufacturer as a customer is because, as a rule, he knows what he intends to buy, though it does not necessarily follow that he always knows what would be the best thing for his purpose, and he goes direct to the maker and does not wish to introduce into the machines all sorts of special features, which may sometimes defeat their own end. Nor does he hamper the manufacturer unduly with penalty clauses and other galling restrictions.

On the other hand, the builder, at all events in the early stages of his career, often wants more latitude in the way of credit than is usual with other customers. After all, this is only natural, for the position of the small builder is much like that of the small farmer. Both are dependent on their crops and the contract is the builder's crop. His small capital is often strained to its utmost limit by the work and material which he has to put into the job before he gets his payments in, and the machinery, if it is to be of any use to him, must be forthcoming when the contract is started, just as the farmer must have his ploughing tackle months before his crops materialise.

As a rule, the respectable small man will find manufacturers who are prepared to accommodate him to some extent in this respect and, if bad debts are occasionally incurred in the process, they are generally of small amount and may be said, as a rule, to constitute a legitimate business risk. In short, the manufacturer and the builder understand each other's requirements and ways, and collectively the business done between them is considerable.

Stock Facilities.

Woodworking engineering firms, in this country, at all events, do not manufacture to any very large extent for stock as a general rule. Such of their machines, however, as are manufactured on this principle, may nearly all be classed as builders' tools. This is because the risk of that class of machine remaining on their hands for a lengthy period is far less than would be the case with others. The builder, too, is nearly always in a hurry for what he wants, because in the early part of his career the signing of a contract, which he may have to hurry through at high speed, may be the factor which alone would justify him in making his purchase, and he may not have known twenty-four hours before that event that he is destined to get this work.

The Influence of the Builder.

On the evolution of wood-working machinery the requirements of the builder and contractor have had a very great influence. Many hundreds of machines for sawing, planing, moulding, mortising, tenoning, boring, &c., have been designed and constructed primarily to suit his requirements, and it is no exaggeration to say that fifty years ago the trade publications issued by the various manufacturers of wood-working machinery were little more than catalogues of builders' plant. In them we found "contractors' frames," "contractors' saw benches," "general joiners for builders," and there would hardly be a machine in those earlier books which was not intended for the builder, or a page of the letterpress which was not addressed to him. That the makers in those days regarded the builder as their primary *objectif* is emphasised by the fact that, apart from their wood-working machines, they included in their catalogues such plant as stone-sawing and dressing machines, mortar mills and other tools which were of use only to the builder. Thus for generations the makers have catered particularly for the builder, and the builder has got into the habit of expecting to find what he requires, if not always actually ready-made, at all events deliverable at an early date from standard patterns.

The Builders' Requirements.

And what are the qualities he looks for in the plant he buys? Let us begin with the process of elimination. Except in the case of large builders we may, as a rule, cut out the conversion of logs. And yet many comparatively small builders are obliged to equip themselves for log sawing, because a builder never knows what quality of timber he may be called upon to use and, unless there are log mills in the neighbourhood, he may often find it necessary to do his own log sawing. We may also, as a general rule, eliminate from the builders' workshop those ultra high speeds in sawing and planing which are required in the general saw mills. This is because, although there is no user of machinery who at times requires to get the very utmost of production in a short time more than does the builder, those periods of rush in the machine shop are interspersed with periods of comparative stagnation. When such is the case he would not be justified in putting down saws which would cut at 200 ft. a minute, or planers that would cut at 300 ft. a minute, when his average requirements may be perhaps only a fifth or a tenth of that amount.

The special machinery required for the rush tactics adopted in these days in the larger general saw-mills working for the trade are only justified when a steady continuity both of demand for goods of a specific class and supply of materials for making them are both assured year in year out, and this is not the case in the ordinary builder's yard.

The Qualities of Builders' Machines.

The two great qualities that the average builder has to look for in his machines are: (1) endurance; and (2) versatility. The first is because he is often obliged to force the output unduly and to use his machines rather brutally in the process, and the second is because there is hardly an operation that is known in wood conversion that he will not be called upon to perform at one time or another by means of the machinery which he has at his disposal. This applies equally to the small man who has one or two machines, or to the large man who has twenty or thirty, and the selection of his machines is, therefore, a far more difficult problem for the former than for the latter, as is also the problem of continuity of work.

Extraneous Aid.

It is true that in these days very much of the woodwork which is put into the construction of the ordinary house by the builder is virtually prepared for the purpose before it reaches his hands. All the flooring and mouldings and most of the matchboarding, for instance, which are turned out systematically in the general sawing and planing mills are destined for the use of the builder, and much of this material need never be touched by his machinery beyond cross-cutting it to various lengths. Roofing timbers and joists may also be had cut to the required sections, and doors and window frames are imported ready made in huge and ever-increasing quantities.

This naturally simplifies the matter for the small builder, and greatly reduces the quantity of the machinery that he has to put down, but it in no wise reduces the number of different operations which his machinery will have to perform. This is because he has to work to specification, and that specification may or may not accord with the standardised dimensions of the articles available. Thus, as far as machinery is concerned, he must always be prepared at a pinch to make throughout any of the woodwork that may be required of him, even although he may expect to be able as a rule to purchase most of the material either completely formed or nearly so. This is because he cannot count with certainty on such being the case at all times. In fact, he knows not what to-morrow's contract may bring forth, and any deviation from the ordinary conditions may make the difference between whether the builder can purchase outside or must prepare his own material. Even so small a matter as a slight deviation in the contour of a moulding from accepted standards may affect this question very materially.

Question of Standardisation.

Though the standardisation of certain units in the cheaper class of house, and to some extent in the houses themselves, has been attempted, it has not gone very far in this or any other country except in Japan, where from time immemorial all the rooms and corridors and verandahs, and consequently the houses themselves, are built to multiples of the "tatami," or mat which carpets the floor, and is of a standard size (about 6 ft. by 3 ft.), and where rooms are always of a standard height. Thus a house which occupies an area of 900 sq. ft. would be described as a "50-mat house," and a room 15 ft. by 12 ft. as a "10-mat room." In that country alone would it be possible to adopt the principle of house building on the "Ford car principle," and although that policy has not been adopted it would be a comparatively easy matter in that country so to arrange matters that the whole of the wood-work, with the exception of the decorative work which varies, could be made throughout by mass production in large factories which would relieve the builder entirely of the purchase of machinery for his own use. Such an ideal state is never likely to exist elsewhere, and the individual builder must, therefore, employ machinery in varying quantities and of various types.

The Functions of Machinery.

And whether the plant be large or small he must be able to use it for sawing, cross-cutting, planing, moulding, recessing, trenching, mitreing, mortising, tenoning, boring, and, in fact, for nearly everything of which wood-working machines are capable. It often happens, too, that, quite apart from the conversion of material for building purposes, a builder, in order to work up his waste wood and make it a source of profit, may utilise certain special machines, such as those used for making paving blocks, wood-wool, firewood, or other readily saleable articles, which can be made from oddments.

Of the plant required by the builder, wood-working machinery is, of course, by far the largest factor, though he has also been a steady though small user of machine tools for metal work. A forge, a lathe and a drilling machine are all essentials to a builder's equipment when he has risen above the lower rungs of his ladder. These, and his faithful old friend, the mortar mill, with certain simple wood-working machines,

formed, thirty years ago, the whole of his requirements, mechanically speaking; but to these to-day have been added a multitude of modern machines such as pile-drivers, concrete mixers, asphalte plant, concrete slab machines, well-sinking tackle, pneumatic drills, and in some cases even road-making plant. Thus his requirements at the present day are both varied and extending, and the purpose of these articles is to show how his requirements can best be fulfilled and how his machinery can be utilised to the best advantage.

Machinery is Incidental.

We must always bear in mind that machinery, important and essential as it is to the builder, is, after all, one of a number of other factors which go to make up his business. It is, in fact, incidental to his calling and not the first consideration to occupy him to the exclusion of other matters. Unlike the saw-mill proprietor, who may be regarded as one who becomes an expert in saw-mill machinery from force of circumstances, because his living depends entirely on the efficiency of the machines he employs, the builder very often has not the time to devote himself to a close study of the question. This is because his main business is to erect buildings and carry out other important work from purchased materials, and any actual manufacturing of the units that he has to do is thrust upon him, and his machinery which enables him to do it is merely a necessary adjunct to his other work.

It is true that the ordinary sawmill owner has to purchase his timber; but he is a regular and steady customer and his purchasing may be reduced to a routine, and he can look ahead in purchasing. Not so is it with the builder, whose requirements for timber are often spasmodic and very varied. And in addition to his timber he has to buy everything under the sun in connection with his trade, even sometimes the land on which he builds. Over and above all this his brain and his time are primarily occupied in fighting for his contracts, financing them and carrying them out in all their intricate detail. Small wonder is it, therefore, that with all these anxieties he cannot always give that close attention to the purchase of machinery that is desirable. Consequently he frequently—especially in the early stages of his career—errs in the selection of his plant and fails to turn it to the best advantage when he has got it. Too often in this respect he is apt to follow an old-established practice, which may or may not be sound at the present day, and which may lead him into a policy in production which is neither efficient nor up to date.

These articles are intended to guide him out of that groove by discussing the evolution of the machines which he employs and by putting him in the way of obtaining the best results from the plant which is now available.

The Flavel Training School.

On December 28, the students of this institute spent an evening at the Flavel Social Club, Leamington. The chair was taken by Mr. Flavel; and Mr. W. E. Pengelly, the late head of the Weston Training School, gave a short address, in which he impressed upon them the very fine opportunity open to them for making a success of life, when they reached manhood. Mr. Flavel then explained the details of his scheme in founding the Training School, and pointed out the way for the students to obtain the full advantages offered. He appealed to the students carefully to assimilate the instruction given and so fit themselves to become really skilled tradesmen and useful citizens. The Superintendent of the Training School, Mr. F. P. Carr, then read the report, and thanked Mr. Flavel for all that he had done for them.

£10,000 Gift to Hospital.

The committee of the Kent County Ophthalmic Hospital, Maidstone, has received a donation of £10,000 from Mr. J. W. Wheeler Bennett, High Sheriff of Kent, for the extension and improvement of the institution.

RATES OF WAGES IN THE BUILDING TRADE.

The following are the rates of wages in the building trade in England and Wales. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

	Masons.	Bricklayers.	C'p'ters, Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Labourers.
Aberdare	1/7	1/7	1/7	1/7	1/7	1/7	1/7	1/2½
Accrington	1/7	1/7	1/7	1/7	1/7	1/7	1/7	1/2½
Altrincham	1/7	1/7	1/7	1/7	1/7	1/7	1/7	1/2½
Ashton-under-Lyne	1/7	1/7	1/7	1/7	1/7	1/7	1/7	1/2½
Barnsley	1/7	1/7	1/7	1/7	1/7	1/7	1/7	1/2½
Barrow-in-Furness	1/7	1/7	1/7	1/7	1/7	1/7	1/7	1/2½
Barry	1/7	1/7	1/7	1/7	1/7	1/7	1/7	1/2½
Bath	1/4	1/4	1/4	1/4	1/4	1/4	1/4	1/0
Bedford	1/4½	1/4½	1/4½	1/4½	1/4½	1/4½	1/4½	1/0½
Birkenhead	1/9	1/9	1/8½	1/9	1/9	1/9	1/8½	1/4

(For rates of wages in the Building Trade in Scotland, see page 91.)

CONTRACTS, COMPETITIONS, &c.

For some contracts still open, but not included in this List, see previous issues. Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, &c., may be obtained.

BUILDING AND PAINTING.

CHICHESTER.—Plans passed by T.C.: Villa, off Stodsbridge-road, for Mr. W. P. Breach; two villas, Market-avenue, for Mr. Springings.

COLCHESTER.—Plans passed by T.C.: House, Straight-road, Lexden, for Mr. H. N. Major; house, King Harold-road, Shrub End, Mr. P. Stow; pair of houses, Bergholt-road, Mr. A. J. Diss; houses in Drury-road, for Mr. A. E. Warner, Mr. P. D. Smith, Mr. H. Westley, Mr. S. F. Dodson, and Mr. A. B. Gusterson; four almshouses, Winsley's-square, the Trustees; rebuilding of premises, High-street, Messrs. W. Paull & Co.; house, Victoria-road, Mr. A. Florey; new bank premises, High-street, Nat. Prov. Union; house, Straight-road, Shrub End, Miss E. Digby; bungalow, Shrub End, Mr. S. G. Purkiss; house, Straight-road, Shrub End, Mr. A. C. Pryke; five bungalows, Greenstead-road, Mr. A. Crowther; six houses, Old Heath-road, Messrs. Grimsey Brothers; houses, Ipswich-road, Mr. W. N. Best and Mr. C. H. Smy; pair houses, Greenstead-road, Mr. P. M. Sloman; house, Nelson-road, Mr. G. Ireland.

CROYDON.—A cottage is to be erected by the T.C. at Russell Hill Reservoir at an estimated cost of £650.—A laboratory is to be erected at the Croydon Mental Hospital at a cost of £500.—Sanction has been received from the Ministry of Health to borrow £20,000 for the enlargement of the Norbury outfall sewer.

DEVIZES.—Plans have been adopted by the T.C. for pairs of cottages on the Southbroom site, for Messrs. L. Maslen & Sons, Mr. T. Stevens, and Messrs. W. E. Chivers & Sons, Ltd.

DEWSBURY.—Plans passed: House on Wakefield-road site, for Mr. J. W. Clegg; house, Wakefield-road site, for Mr. A. Milner; house, Wakefield-road site, for Mr. J. E. Wilson; two houses at Longcauseway, Thornhill, for Messrs. H. D. & G. Benson; house, Longcauseway, Thornhill, for Mr. H. Pease; four houses, Commonside-road, for Mr. J. Crossley; house, Wakefield-road site, for Mrs. Atkinson; house, Wakefield-road site, for Mr. Kemp; house, Wakefield-road site, for Mr. Ledgard; 10 houses at Ouzelwell-lane, for Messrs. Ingham's Thornhill Collieries, Ltd.; three houses off Slaithwaite-road, for Messrs. Brooke Bros.; three houses at Wakefield-road site, for Mrs. Wainwright and Messrs. J. W. Hampshire & Tillotson. The M.H. has approved a scheme for the erection of a further 20 houses on the Wakefield-road housing site, No. 1. Application is to be made to the M.H. for sanction to borrow £1,500 required for the conversion of Moorlands Hall into a maternity home.

DONCASTER.—The Watch Special Sub-Committee has recently inspected the site of the Tannery, Church-street and Grey Friars'-road, which they considered suitable as a site for a fire station and firemen's dwellings, and recommended that the Chief Constable and the Estates Surveyor be instructed to submit schemes for the erection thereon of a fire station and firemen's dwellings, for consideration by the Watch Committee.—The T.C. have also approved of schemes for the erection of 50 houses at Warmsworth-road site, at an estimated cost of £18,082, and for 19 houses in Olive-road, estimated cost £6,942.

DROXFORD.—Plans passed by R.D.C.: Two houses at Meonstoke, for Mr. J. O. Chrystal.

DUDLEY.—Plans passed by T.C.: Christadelphian Trustees, Meeting-room and house, Stourbridge-road; Mr. George Jewess, bungalow, Pedmore-road, Woodside; Mr. Davis, house, Park-road; Mr. M. Hipkiss, house, Arch Hill-street, Netherton; Mr. M. Hipkiss, two lock-up shops, High-street, Netherton; Mr. G. Loat, house, Stourbridge-road.

EDINBURGH.—At the Dean of Guild Court, 25 cases were considered—19 full petitions were granted, the chief of which were the following: Bungalow, for Mr. James Lackie, Allermuir-road, Colinton; 2 houses, for Mr. J. A. Morton, Riselaw, Corstorphine; house, for Mr. Geo. A. Peat, Midmar-drive; 2 bungalows, for Mr. Wm. Robb, Drum Brae; war memorial, Castle, for the Scottish War Memorial Committee; bungalow, for Mr. T. Stoddart, Craiglockhart-drive; bungalow, for Mr. R. E. Taylor, Fernielaw-avenue, Colinton; 4 flatted houses, for Messrs. Topping & Co., Mayfield; double cottage, for Mr. John Westwood, Robbs-lane, Gorgie; sub-division of self-contained house into 3 houses, for Mr. John White, 15, Buckingham-terrace; house, for Mr. G. Williamson, Dovecot-road, Corstorphine; public wash-house, Abbeymount, for the Edinburgh Corporation.——A warrant was also granted for a new building in Duncan-street, Newington, to be used as a telephone exchange, at an estimated cost of £6,000. It is proposed to erect two other telephone exchanges—one at Murrayfield, and the other at Morningside; the present office in Rose-street is to be reconstructed and adapted to other uses. The estimated cost of these three exchanges is £20,000, exclusive of plant and installation.——The alteration and improvement of the Braid Hills Hotel has been considered by the magistrates. Plans have been passed whereby the hotel will be brought up to date, and a number of modern improvements will be introduced.——It has been decided to carry out extensions to the Royal Blind Asylum and School by erecting a pavilion with an area of 5,000 super feet on the ground. The extension is to be on the west side of main buildings, and tenders are to be invited for the work.—The T.C. have procured a site, 50 acres in extent, at Lochend, for the purposes of a town-planning scheme.

EXMINSTER.—It has been decided to construct a new loop-line on the down side of the G.W.R. at Exminster, where extended refuge sidings are included in a scheme of additional accommodation.

FALKIRK.—The Dean of Guild Court has sanctioned plans for steel-frame workshops and warehouse extensions by Messrs. R. & A. Main & Co., Gothic Iron Works, Camelon, and the application of the Camelon Iron Co. for warrant to extend their Berlin blacking shop at a cost of £400.

FERRYBRIDGE.—The Yorkshire Electric Power Co. is embarking upon a scheme for the erection of a large generating station at Ferrybridge, which is ultimately expected to cost £2,000,000; about 130 acres is available for the purposes of the station and provision will be made for a dock to cope with the largest size of canal barges, also for new railway sidings. Tenders will shortly be let for the supply of generating plant.

FOLESHILL.—Plans passed by R.D.C.: 28 houses, for Mr. G. H. Pickering in Hob-lane, Heath and Newtown-roads, Bedworth; two houses for Mr. Gilkes in Heath-road, Bedworth; two houses for Mr. A. Jones in Wheelwright-lane, Foleshill.

FOLKESTONE.—Plans passed by T.C.: House and shop, Canterbury-road, Mr. A. R. Bowles, architect for Messrs. Hayward & Paramor; two houses and shops, Cheriton-road, for Mr. E. Gibbons.

GLAMORGANSHIRE.—The Pontardawe Council has passed plans for 14 houses at Denea-road and 16 houses at Alltycham, for Messrs. Gilbertson (steel works).——The Treharris workmen are formulating scheme for erection of institute and cottage hospital; Mr. T. Andrews, J.P., is secretary.——The County Council is arranging with local authorities, several of whom have promised support, for erection of home for mental deficients.——Application has been made by the Tondu district for erection of public hall (estimated to cost £10,000); Mr. Mason, Cardiff, of the Welsh section of the Industrial Welfare Association, has the application in hand.——The C.C. is embarking upon a scheme for the erection of a large number of schools, together with several mining and engineering laboratories (as part of a scheme of mining education under the Mining Industry Act), and a metallurgical laboratory. The cost of the erection of these new schools and the sites is estimated to total £500,000, and it is proposed to carry out the work during 1924 and 1925. New secondary schools are to be built at Bargoed (£15,500), Gorseinon or Grovesend (£16,500), Pontyclun (£16,500), Pyle (£16,500), and at Whitchurch. The new intermediate school at Caerphilly will cost £30,000, the new girls' department at the Neath Intermediate School £20,000, and the new girls' intermediate school at Port Talbot £20,000. The adaptation of Duffryn House, the one-time residence of Lord Aberdare, as an intermediate school for Mountain Ash, will cost £6,000. Additions and extensions are also contemplated at Aberdare Girls' Intermediate School, the present Bargoed Secondary School, Barry Boys' Intermediate, Cowbridge Grammar School, Garw Secondary, Gelligaer Intermediate, Gowerton Intermediate, and the Ogmore and Pontardawe Secondary Schools. The following new elementary schools are to be erected:—Bridgend, new school for 300, £8,000; Bryncethin, mixed and infants' department for 350, £11,000; Cadoxton, senior and junior departments for 600, £13,000; Cymmer, boys' department for 320, £8,500; Cymmer special subjects centre, £2,500; Derwen Deg, additions for 100, £2,500; Dinas Isaf, senior and junior departments for 800, £19,000; Dunvant new mixed and infants' department for 300, £7,500; Gorseinon, new infants' department for 400 and addition of 80 to boys' department, £10,000; Gwyndy, girls' department for 400, £9,000; Hendre, girls' department for 300, £7,500; Laleston, mixed and infants' department for 150, £4,500; Llanharan, infants' department for 200, £4,050; Llantrisant, additions for 100, £2,000; Llantwit Fardre, boys' or girls' department for 350, £7,700; Maesmarchog, infants' department for 150, £3,450; Nantymoel, boys' department for 416, £12,500; Nantymoel, conversion of existing boys' and girls' departments into girls' department for 348, £4,290; Nantymoel, remodelling infants' department, £2,317; Pantynawel, mixed and infants' school for 400, £9,200; Pencoed, additions for 180, £3,600; Pontlliw, mixed and infants' school for 150, £3,500; Pontyclun, mixed and infants' department for 450, £8,900; Pontycymmer, boys' department for 500, £12,000; Pwllcarn, mixed and infants' school for 200, £5,000; Pyle, mixed and infants' school for 300 and special subjects centre, £9,500; Rhiwbina, mixed and infants' school for 350, £8,000; Skewen, handicraft rooms for boys, £1,250; Tiryberth, boys' and girls' departments for 800, £19,000; Tonmawr, additions for 150, £3,000; Tymeinwr, senior mixed department for 400, £11,000; Ystrad Mynach, boys' department for 400, £11,000.

GELLYGAER.—The U.D.C. has approved plans for erection of 100 houses at Penallta for the Housing Corporation of Great Britain, Ltd. The Surveyor has submitted estimates as follows, for lay-out of Bargold Park by the Council:—Fencing, gates, &c., £1,664; drainage £120; house and shed adjoining, £360.

HAGGONFIELDS.—The Nottinghamshire E.C. proposes building a school at once, in view of the housing scheme of the Shireoaks Colliery Co. at Phodesie.

HALSTEAD.—The R.D.C. has passed plans for a pair of houses at Parley Beams, for Miss K. M. Courtauld.

HEBDEN BRIDGE.—The local Trades and Labour Club Council are to erect a new Trades and Labour Club at Holme-street. The estimated cost is £5,000, of which £3,500 has already been raised. Plans have been prepared by Mr. J. T. Cockroft.

HOVE.—Plans passed by the T.C.: Mr. E. Harrison, for Mr. C. T. Watts, bungalow, Portland Villas; Mr. E. E. Brown, house and motor garage, Langdale-road; Messrs. Field & Cox, for Messrs. Carter Paterson, canteen, Cambridge-grove; Mr. W. H. Overton, for Mr. Marchant, three pairs semi-detached houses and 16 motor garages, Wilbury-avenue; Mr. F. Goodchild, for Mr. W. Querro, detached house and garage, Hallyburton-road; Mr. F. G. Sainsbury, for Mons. G. Fiessinger, house, Princes-crescent; Messrs. C. J. Kerridge & Son, Ltd., for Mr. H. Pears, workshops, Old Shoreham-road; Messrs. Young & Mackintosh, for Mr. F. E. Greville, pair semi-detached houses, Kingsway, at Saxon-road; Messrs. Young & Mackintosh, for Mr. F. E. Greville, three detached houses, Kingsway, at Tandridge-road.

ILFORD.—The Essex E.C. has approved the plans of the County Architect for a secondary school at an estimated cost of £45,041, and authorised the preparation of plans for a caretaker's cottage at a cost of £750.

ILKESTON.—Plans passed by T.C.: Pair of houses, Cantelupe-road, for Stenson & Chapman; pair of houses, Nottingham-road, for W. Holbrook; stable, Albert-street, for J. Loseby; two pairs of houses, Hallam Fields-road, for E. Cobb.

KEIGHLEY.—The T.C. have approved a recommendation from the Housing Committee for the acceptance of tenders for the erection of 30 houses on the Broomhill Estate at an estimated cost of £15,000.

KEXBROUGH.—The West Riding C.C. E.C. propose to erect a new elementary school to accommodate 300 children.

LEEDS.—The Finance and Parliamentary Committee of the Corporation has approved the proposals for alterations to premises in Park-lane. These offices are to be utilised by the City Treasurer's Department. It was decided to apply for borrowing powers to carry out the necessary alteration of premises, furnishing and equipment, at an estimated cost of £18,826.

LEYTON.—Plans passed by U.D.C.: T. Cox, garage and offices, 442, High-road, Leyton; J. A. Dartnall, new premises with billiard hall, 638, High-road, Leytonstone.

LIVERPOOL.—The T.C. has prepared an electricity extension scheme to cost £640,000.

LLANYBYTHER.—The M.T. has promised R.D.C. 50 per cent. of cost of reconstructing Nantyffin Bridge and has asked that plans of work be submitted.

MALTON.—The scheme for a new hospital has advanced a step by the generous gift of an excellent site in Middlecave-road by Earl Fitzwilliam. Plans have been prepared, estimated cost is £17,000, of which £6,500 has been raised. The various parishes are to subscribe the remainder.

MANCHESTER.—Plans passed by T.C.: Sixteen houses, Clevendon-street and Whiteway-street, Moston; eight houses, Whiteway-street and Vernon-street, Moston; eight houses, Clevendon-street and Vernon-street, Moston; two houses, Hill-lane, Blackley; 16 houses, Hill-lane, Blackley; 32 houses, Beresford-road and Elsdon-road, Rusholme; 34 houses and two shops and houses, Beaver-road, Adria-road, Veronica-road, and Gaddum-road, Didsbury; ten houses, Omer-drive, Burnage; addition to museum, Manchester University, Oxford-road, Chorlton-upon-Medlock; six houses, Alexandra Park; four houses, Waltham-road and Springbridge-road, Withington; four houses, Manley-road, Withington.

MERTHYR TYDFIL.—Plans passed by B.C. Plans Committee: Lock-up shop in Aberdare-street, for Mr. W. Morgan, Heolgerrig.——The Public Works Committee has decided to proceed with reconstruction

* See also our List of Contracts, Competitions, etc.

of west side of Taibach-road at estimated cost £2,250, and has applied for grant of necessary land.

MONMOUTHSHIRE.—The Bedwas and Machen U.D.C. has applied to the Ministry of Health for sanction to sell land at Trethomas to the Bedwas Navigation Colliery Co., who have applied for land to erect 120 houses.—The Bedwas U.D.C. has also decided to urge the Gellygaer U.D.C. to join in constructing a joint road viaduct from Hengoed to Maesycwmmer.—The Newport T.C. is to acquire St. Julian's House for conversion for secondary school purposes.—The Sites and Buildings Committee of the County Education Committee has decided to purchase land of a new school at Trauch, Pontypool. The architect has been instructed to prepare amended plans of a proposed new central school at Pontllanfraith. Notice has been given by the Bedwas and Machen U.D.C. that in March they will proceed with sewer construction and sewerage works schemes at Trethomas. It is proposed to lay 12 in. diameter mains.

MORECAMBE.—Plans passed by T.C.: Mr. W. H. Walker, 14 semi-detached houses, off South-road; Mr. T. F. Scales, house, corner of Regent-road and Windsor-road; Mr. F. Barber, house, Balmoral-road; Mr. E. A. Jowett, house, Hawarden-avenue; Morecambe Corporation, chapel, shelter, and lodge at Torrisholme Cemetery.

NEWBURY.—The T.C. has decided to erect 12 semi-detached cottages on Essex-street.

NORMANTON (YORKS).—Plans passed: Bungalow in Dalefield-lane, for Mr. J. H. Banks.

NORTHAMPTON.—Sir James Crockett has made a gift to the Northampton Hospital of £5,000 to establish an isolation building.—Plans passed by T.C.: Eight houses, Lincoln-road, for G. F. Sharman; two houses, Delapre-crescent, for E. H. Tibbs; four houses, St. George's-avenue, for A. Holloway; house, Lime-avenue, for S. Frost; house, Delapre-crescent, for J. E. Powell; house, The Crescent, for Mrs. West; house, Cedar-road, for A. E. Osborne; house, Chaucer-street, for H. Frisby; house, Garrick-road, for Supt. Thompson.

PAIGNTON.—The directors of the G.W.R. have authorised extensive improvements at Paignton station. Additional platform covering is to be provided, an enlarged booking-office and a new parcels office built, increased lavatory accommodation arranged, and a waiting shed constructed for the use of passengers. A refuge loop is also included in the plans.

PEMBROKESHIRE.—The St. Dogmael's D.C. has decided to invite tenders for repair of Moygrove Bridge, and has called for plans and estimates for proposed bridges at Pontsaithgarreg and Felinisaf, Whitchurch.

RAMSDEN CRAYS.—Plans by the County Architect of a school at an estimated cost of £5,000 have been approved by the Essex E.C.

ROTHERHAM.—Plans passed by T.C.: Mr. W. E. Taylor, jun., Moorgate-road, pair of semi-detached houses; Mr. W. Richardson, Broom-road, pair of semi-detached houses; Mr. A. J. Gill, Moorgate-road, pair of semi-detached houses; Mr. G. A. Catchpole, Boswell-street, bungalow; Mr. S. Hartley, Clough-road, house; Messrs. J. Fawcett, Ltd., 18–20, High-street, alterations to shop premises, Messrs. Williams Deacon's Bank, Ltd., High-street; Miss H. Wheatcroft, Boswell-street, pair of semi-detached houses.——Representatives of the R.D.C. and the Rother Vale and Dalton Main Collieries have met at the Ministry of Health. The colliery companies intimated that they were prepared to build a number of houses under the subsidy scheme if the Council would undertake to build an equal number. After a full discussion with the Ministry, a provisional sanction was given for the erection of 200 houses at Thurcroft—that is, 100 by the colliery company and 100 by the Rural Council; and 400 at Dalton or Thrybergh, or in that neighbourhood, of which 200 are to be erected by the colliery company and 200 by the Council.——A new police court house is to be erected, at an estimated cost of £23,000; out of this the local authority will have to contribute £10,000.

SALFORD.—Plans passed by T.C.: Construction of warehouse, Clowes-street, Salford; conversion of house into two houses, "Cona Manor," Duncan-street, Broughton; house into two houses and construction of garages, 11, Devonshire-street, Broughton.

SELBY.—At the last meeting of the R.D.C. the M.O.H. presented a report in regard to the supply of water for the extensive parish of Wistow, which had 4,312 acres and a population of 479 in 166 houses, and extended four miles from east to west and one-and-a-half miles from north to south. It was eventually decided to give notice of a proposal for two schemes to be prepared for the village and outlying parts for supplying the district with water from Selby Waterworks.

SOUTHPORT.—The T.C. agreed to the proposed expenditure of £9,000 odd on the Victoria Baths, Promenade, on condition that a plan be prepared showing the full extent of the contemplated alterations. The proposed expenditure so far is for a section of the Baths only.—The Corporation Gas Committee is applying to the M.H. for sanction to borrow £63,000 for various purposes connected with the gas estate.

SOUTHWICK.—The U.D.C. propose to proceed immediately with the erection of 90 houses, with the prospect of another 200 provided sanction is approved from the Ministry of Health to the laying out of the land.

SOWERBY BRIDGE.—Plans passed: Three houses, Milton-avenue, for Mr. F. Stockton.——The Ministry of Health has approved of the erection of 20 more houses on Albert-road Housing Site.

ST. HELENS.—Plans passed by T.C.: Four houses, Bishop-road, Mr. I. Griffiths; house, Hartington-road, Denton's Green, Mr. Henry Barton.

THORNCLIFFE.—Messrs. Newton, Chambers & Co. propose erecting general offices at Thorncliffe.

N. Hill; Mr. Herbert Dobson, house, Holmfield-lane, for Mr. N. Bedford; Messrs. Bell & Kay, house, off Dewsbury-road, for Mr. A. C. Milner; Messrs. Moore & Crabtree, rebuilding of wool warehouse and additions thereto, in Ings-road, for Messrs. M. P. Stonehouse, Ltd.; Mr. H. Dobson, two houses, Denby Dale-road, for Messrs. A. & H. Fisk.

WEDNESBURY.—Plans passed by T.C.: Mr. H. Waldron, house, St. Paul's-road.

WEST THURROCK.—The Thames Land Co. is seeking powers from Parliament to construct a wharf on the Essex foreshore at West Thurrock, and to carry out the scheme it is proposed to form a company with a capital of £1,500,000.

WETHERBY.—The R.D.C. has decided to commence erecting houses at once by direct labour.

WEYMOUTH.—Plans passed by T.C.: cottage, Belle Vue-road, T. G. Davidson, for Mrs. Penny.

WORTHING.—Plans passed by T.C.: House and shop, Broadwater-road, T. R. Hyde, for Potter, Bailey & Co., Ltd.; three houses, shop and showroom and 36 lock-up garages on the south side of Railway-approach, F. G. Abell, for Worthing Estates Building Co.; house, Langton-road, F. G. Abell, for Worthing Estates Building Co.; two houses, Gannon-road, J. E. Lund, for F. H. Butler; house, Lansdowne-road, E. G. Goodall, for N. L. Watts; 14 houses, Church-walk and Navarino-road, for E. H. Barton; house, Pavilion-road, J. Gausden, for G. W. Wyatt; two blocks of three flats and garage fronting Wordsworth-road and Heene-place, W. B. Collins, for T. R. Dewell; two houses, Gannon-road, for E. H. Barton; three houses and garages, Homefield-road, for G. Tickner; vicarage Victoria-road, T. R. Hyde, for Vicar and Churchwardens of St. Andrew's Church; house, Bath-road, A. Carden, for W. Boswell; house, Littlehampton-road, H. J. Sparkes, for W. Margesson; house, Ham-road, E. W. Sparkes, for —. Woffenden; house and garage, Grand-avenue, W. Weller, for W. Weller; houses and garage, St. Lawrence-avenue, for B. Barry; house and garage, Mill-road, A. Clare, for M. J. Huxtable.

WHARFEDALE.—The Ministry of Health has decided to hold an inquiry into the application of the R.D.C. to borrow £2,000 towards the cost of draining the newly developed garden city at Cookridge, on the outskirts of Leeds.

WHITBY.—Plans passed by R.D.C.: Bungalow, near Cross Keld, for Captain W. Estill, architect Mr. H. P. Hopkins; house, Lowdale, Sleights, for H. Richardson, architect Mr. G. S. French; bungalow, Glaisdale, for Mr. H. Fry, "Marieville," architect Mr. W. R. Robinson.

YORK.—Plans passed by T.C.: T. Belt, two houses, Lime-avenue; G. H. Pegg & Son, five houses, Cameron-grove; and Mrs. Taylor, house, Moorgate.

FIRE.

CLACTON.—On Friday last the electric power station of the U.D.C. was destroyed by fire.

New Premises, Holborn, E.C. MESSRS. GILBERT & CONSTANDUROS, Architects.

NEW BUILDINGS IN LONDON.

Old Broad-Street. — REBUILDING. — Messrs. Lazard Bros. & Co., Ltd., Bankers, of Old Broad-street, are having their premises rebuilt. Messrs. Gunton & Gunton, of Finsbury House, E.C.2, in conjunction with Mr. A. V. Heal, of 11, Gray's Inn-square, W.C.1, are the architects for the work.

Threadneedle-street.—INSURANCE OFFICES.—A new head office is now being erected for the Eagle Star & British Dominions Insurance Co., Ltd., at 1 and 2, Threadneedle-street, E.C. The architects for this work are Messrs. Gunton & Gunton, of Finsbury House, E.C.2, in conjunction with Mr. A. H. Moore, F.R.I.B.A., of 11, Dowgate-hill, Cannon-street, E.C.

Arthur-street West.—OFFICE BUILDING.—Messrs. Gunton & Gunton, of Finsbury House, E.C.2, are the architects for a new block of business premises in Arthur-street West, E.C., to be known as King William-street House. The site covers about 16,000 ft. super.

Seven Sisters-Road.—SHOWROOMS AND OFFICES.—New showrooms and offices are to be built in Seven Sisters-road for the Gas Light & Coke Co. The back portion of premises will be completed first, i.e., general stores, &c., and the showrooms later. The elevation is in red facings with Portland stone dressings, &c. The floors will be fireproof and flat roofs will be used. No sub-contracts have yet been placed. Messrs. Dove Bros., of Cloudesley-place, N.1, are the builders.

Strand.—REBUILDING.—Messrs. Gunton & Gunton, of Finsbury House, E.C.2, are the architects for the rebuilding of 112, Strand.

Tufton-street.—GENERAL OFFICES.—Mr. C. W. Ferrier, of 11, Waterloo-place, Pall Mall, is the architect for the Mary Sumner House, Tufton-street, S.W.1. The interior of the chapel is the work of Mr. Paul Waterhouse, P.P.R.I.B.A. These offices are being erected for the Mothers' Union. It consists of five floors with a flat roof, upon which it is subsequently intended to add an attic story, and comprises the general offices, together with an assembly room seating 250 persons, a chapel, library and some residential accommodation. Messrs. Perry & Co. (Bow), Ltd., are the builders and the structural steelwork is being carried out by Messrs. Drew-Bear, Perks & Co., Ltd.

Cannon-street.—FIRE STATION.—Messrs. C. P. Roberts & Co., Ltd., builders, of Tyssen-street, Dalston-lane, E.8, are carrying out various alterations required by the L.C.C. for altered accommodation. The steelwork is being executed by Messrs. C. A. & A. W. Haward, of 171, King's Cross-road, W.C.1.

THE SCOTTISH BUILDER

THE EDINBURGH DISTRICT PROPERTY MARKET.

DOWELL'S annual review of the heritable property market for 1923, issued on January 1 from 18, George-street, Edinburgh, gives a distinct indication that the property market is in a healthy state. The transactions noted show that the demand has been for occupation, and there is little evidence that the sales have been for speculative purposes or re-sales, though there has been a certain amount of investment in tenement property. The sales of town properties have increased, but there has been little demand for large houses in prominent streets and squares of the West End. Not a few of these have been converted into flats. The demand for flats and small houses, where possession can be given, is unabated. Many that have changed hands have done so at twice the pre-war figure. Important sales have also been made in commercial premises in Princes-street. A good demand for small residential estates in the country is recorded. Should agriculture be encouraged by the Government, there might be more demand for agricultural estates.

In town property, 152 lots sold realised £166,105, the increase on upset price being £11,000; the 52 lots sold privately realised £94,580. Of country property, 45 lots changed hands, realising £87,286, an increase on the upsets of £7,473; nine lots sold privately realised £29,385.

The Burgh Assessor's return for the year 1923–24 of the valuation of Greater Edinburgh is as follows:—

Dwelling-houses, business premises, public buildings, churches, &c.	£4,472,297 0 9
Railways, street tramways, harbours and docks, gas, electric lighting, water, sewers, telegraph and telephone wires	780,934 2 2
	£5,253,231 2 11

The total increase on the previous year is £159,730 8s. 7d.

The number of unoccupied houses is 305 with a total rental of £13,676 2s. 7d.; and the number of unoccupied shops is 67, with a total rental of £2.436.

The most important buildings for which warrants have been granted during the past year are: Seafield-road, British Oxygen Co., Ltd., £8,000; Hawkhill, Leith, J. K. Smith, bakery, £16,000; Princes-street, Messrs. D. S. Crawford, alterations, £13,000; Spring-gardens, Maternity Hospital, £30,000; Princes-street, Messrs. J. W. Mackie & Son, Ltd., alterations, £30,000; Stewart-terrace, Messrs. McVitie & Price, bakery additions, £8,000; Gorgie tenements, £40,000; Grassmarket tenements, £10,000; St. Leonard's-hill, James Clark Technical School, additions, £14,500; Charlotte-square, Ladies' Caledonian Club, alterations, £8,000; South Bridge British Linen Bank, £21,000; Granton, Caroline Park, Messrs. A. B. Fleming & Co., Ltd., additions to works, £11,000; Leith War Memorial (Children's Hospital), £27,000; Newcraighall, Workmen's Institute, £7,000; Westbank, Portobello, transformer house, £9,250; Dean Distillery, converting to bonded warehouse, £7,000; Castle-terrace, Synod Hall, reconstruction, £8,000; Wardie tenements, £14,750; Bryson-road, Edinburgh and Dumfries-shire Dairy Co., Ltd., alterations and additions, £16,000; Hope-street, Royal Bank of Scotland, £65,000; St. Clair-street, Leith, tenements, £23,130; Bellevue Technical School, £30,000; Leith, James-place, school, £30,000; Newcraighall, Benhar Coal Co., housing scheme, £20,160; Semple-street, St. Cuthbert's Co-operative Society, garage and workshops, £25,000; The Castle, Scottish National War Memorial, £50,000.

In the City of Edinburgh "Accounts," just published, the total expenditure amounts to nearly five millions sterling.

NEW BUILDINGS IN SCOTLAND.

Paisley.—FACTORY BUILDING.—The Dean of Guild has passed plans for the British Cotton and Wool Dyers' Association, 22, Cumberland-street, Deansgate, Manchester, to erect a stuff-house at Laighpark.

Stornoway.—HOUSES.—The Ross-shire C.C. has granted permission to the Lewis (Stornoway) District Committee to erect 28 houses, at a cost of £600 each.

Kingseat.—HOUSES.—The Kingseat Mental Hospital Committee of the Aberdeen City Board of Control has recommended the erection of two new houses and an addition to the nurses' home.

Edinburgh.—LABORATORY.—The Rockefeller trustees have offered £50,000 towards the erection of a clinical laboratory at the Edinburgh Royal Infirmary.——The Dean of Guild Court has approved of the reconstruction of existing premises for out-patients at Leith Hospital, Mill-lane.

Leith.—TOWN HALL AND LIBRARY.—The Lord Provost's Committee of Edinburgh T.C. has recommended the Council to provide a town hall and library for Leith.

Brighouse.—CHURCH HOUSE.—A church house is to be provided at Brighouse.

Crombie.—JANUARY 12-16.—SCHOOL.—Proposed new school to be erected at Crombie, near Dunfermline, for the Fife Education Authority. Mr. G. G. Storrar, architect, Cupar. Mr. J. Gentles, surveyor, Central Chambers, High-street, Kirkcaldy. £1 1s.

Aberdeen.—JANUARY 14.—HOUSES.—Four blocks, each containing 12 dwellings, in connection with Cattofield Housing Scheme, for the Town Council. All particulars from Mr. Coutts, Housing Dept., Town House, Aberdeen.

Royal Scottish Academy.

Mr. G. Washington Browne, R.S.A., was recently elected President of the Royal Scottish Academy in place of Sir J. Lawton Wingate, who has resigned.

He received his early training in Glasgow and afterwards served under London architects and gained the Pugin Travelling Studentship.

Mr. Browne designed the King Edward Memorial at Holyrood, which the King unveiled in the autumn of 1922; also the Edinburgh Public Library, and numerous war memorials throughout Scotland.

Yarrow Church.

This church (built in 1640), which was destroyed by fire last year, has now been re-opened.

New Docks for Glasgow.

Some years ago the Clyde Navigation Trustees acquired an area of land on the south side of the Clyde between Shieldhall and Renfrew having a frontage of about 1¾ miles. The first step has now been taken towards the construction of new tidal docks on this site, and tenders have been invited for the construction of a length of 1,900 yards of the quay wall of what will be No. 1 dock. A contract has already been let to Messrs. Sir Robert McAlpine & Sons for road works, and to Gray's Ferro Concrete Company for bridge work in connection with the scheme.

Three reinforced concrete bridges will be required to carry the new road over the railway which will serve the new dock, and to provide for the accommodation of the existing Renfrew District Railway, which will be diverted for a portion of its length. Two of the bridges will be four-span structures, while the third bridge will consist of two spans. All the bridges are being designed on the Considère system, and will make provision for the passage of heavy traffic to and from the docks.

BUILDING TRADE WAGES IN SCOTLAND.*

THE following are the present rates of wages in the building trade in the principal towns of Scotland. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

	Masons.	Brick layers.	Carpenters, Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Brick-layers' Labourers.	Masons' Plasterers' Labourers.

NEW INVENTIONS

The "Borwood" Bit.

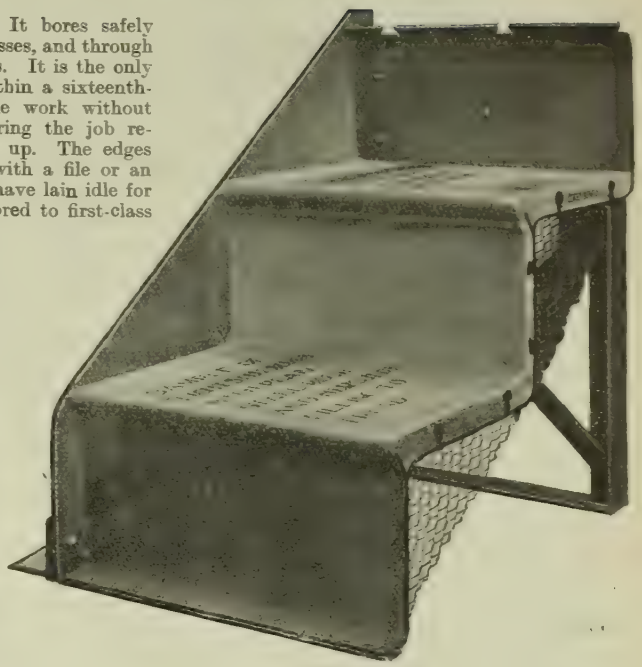
We have received some particulars regarding the new patent "Borwood" bit, which is claimed to bore holes quicker than ordinary bits with less pressure and to leave the walls smooth and clean, as if they had already been sandpapered. The manufacturers state: "The bit is simply and strongly built, and is designed for use by machine or hand. The work it does is briefly as follows:—(1) Boring; (2) boring taper holes; (3) boring a countershaft in one operation; (4) making mouldings or sinkings of any circular design. The secret of the 'Borwood' bit lies in its design. Essentially simple in its construction, it is an all-round improvement on the ordinary boring bit.

"Owing to the depths of its shanks, the bit bores equally well across or end grain, and there is no danger of wandering even where it meets other holes or soft patches. It bores safely through any number of thicknesses, and through single unsupported thin boards. It is the only boring bit which will bore within a sixteenth-of-an-inch of the edge of the work without bursting the sides. After boring the job requires practically no cleaning up. The edges can easily be reached either with a file or an oil slip, and although it may have lain idle for months on end it can be restored to first-class condition in less than five minutes. The easy way in which they can be reached enables the cutting edges to be shaped as best suits the class of boring being done. The two routers are balanced so that there is an equal pull on both sides. Two cuts are taken for each revolution of the head. This construction allows ample room for clearance, and practically eliminates the risk of burning and choking. It is manufactured from special cast-steel, scientifically hardened and tempered to give durability. It can be run at high speeds with consequent increased production.

"The bit is made either with or without a centre. When a centre is provided it may be the ordinary screw pattern which takes hold of the wood and draws the bit after it. A special patent bit has been designed to obviate any danger of the work flying round on the bit. This new centre enters the wood freely, but it does not control the feed. In this way the operator is able to make a heavy or light cut at will, according to the class of work on which he is engaged. This bit is easily withdrawn from the hole without the necessity of reversing or the possibility of tearing. Unless specially mentioned the bit is supplied with this new centre in all cases where bits are ordered for machine use. For hand use the ordinary centre is provided.

"For moulding purposes the bit is an adaptation of the boring-bit. Almost any design of circular moulding can be made within a very short space of time.

"After the bit has been withdrawn it requires practically no cleaning up."



The manufacturers are the Borwood Tool Co., Ltd., Ditton Works, Newmarket-road, Cambridge.

The "Borwood" Bit.

New Staircase.

The new type of staircase illustrated above has been put on the market by the Light Steelwork, Ltd., 178, York-road, King's Cross, W. 1.

New Staircase.

The treads and risers are formed in one piece out of steel plate bent to shape. The sections are then riveted together and connected to a steel string by means of angle cleats built into or otherwise attached to walls as the case may be. When these individual sections are riveted together they form a series of trays or centering, and small studs or caulkings are provided to act as keys for the material or filling destined for the tread or wearing surface proper. This filling may be of granolithic, with a dusting of carborundum to make it non-slipping, or any suitable substitute of a hard-wearing or non-slipping nature. The steel sections thus perform three functions, viz., first, as permanent centering; second, as structural support; and thirdly, as the tensile member of a beam with the material used for filling under compression.

If desired, the risers may be coated with the same material as the tread, but in this case the top edge of each bent plate would be notched or serrated to act as a key for the nosing by allowing the filling of the tread to unite firmly with the riser covering. If it is considered desirable the underside of the stairs can be provided with expanded metal or other suitable lathing wired to the structure, which, when plastered, will form a soffit to the underside of the stairs. The same method is employed for the construction of winders and landings, each winder or landing being a tray of steel filled in with the composition selected and properly stiffened or supported to impart the necessary strength.

The manufacturers of this system of staircase construction claim several advantages to be gained by its use:—(1) Low cost of carriage owing to lightness; (2) Low cost of erection, because flights and landings, each in one piece, can be delivered to the site ready for hoisting into position and bolting or riveting together; (3) Time saved in erection; (4) Fire-resisting qualities; (5) In its simplest form the cost compares favourably with any other type; (6) It is especially suitable for use for area stairs where there is a risk of heavy weights being dropped; (7) It will carry safely very much greater loads than can be placed upon staircases in ordinary circumstances.

Where a staircase is to be fixed between walls, steel strings are unnecessary. In this case the sections could be delivered riveted together, braced by steel or wood booms bolted together and long enough to be built into the walls during the progress of the work. After being erected into position and built in, the braces or booms can be removed, and the stairs are ready for filling in.

NEW COMPANIES.

THE particulars quoted below have been compiled by Messrs. Jordan & Sons, Ltd., Company Registration Agents, of 116 & 117, Chancery-lane, W.C.2, from the documents available at the Companies' Registry.

DEMOLITION & EXCAVATION (GREENHAM), LTD. (193,688). Registered November 12. Rosebank Wharf, Fulham, S.W. To purchase from Henry J. Greenham, Ltd., of Rosebank Wharf, Fulham, S.W., demolition of buildings and excavation of land as heretofore carried on by them. Nominal capital, £1,000.

F. J. RASHBROOK, LTD. (193,670). Registered November 10. Elm Works, 68, St. Ann's-hill, Wandsworth, S.W. Builders, decorators, electrical engineers, &c. Nominal capital, £1,000.

SALTER BROS. (ELLESMERE PORT), LTD. (193,734). Registered November 13. Heath Farm, Whitby Heath, near Birkenhead. General contractors, builders' merchants, &c. Nominal capital, £600.

BATEMAN'S CONCRETE WORKS (SLOUGH), LTD. (193,650). Registered November 9. Bush House, Aldwych, W.C.2. To manufacture and sell all forms of pre-cast concrete, and to acquire by lease or otherwise certain lands situate at Salt Hill Gravel Pits, Slough. Nominal capital, £750.

J. PULLAN & SONS, LTD. (194,023). Registered November 27. 15A, Marley-terrace, Beeston, Leeds. Builders and contractors, now carried on by Ernest Pullan and Alfred Pullan at Beeston, Leeds, under the style of J. Pullan & Sons. Nominal capital, £3,000.

BLYTH, LTD. (194,035). Registered November 28. 360, High-road, Kilburn, N.W.6. Builders and contractors, &c. Nominal capital, £3,000.

ARCHITECTURAL TOWN-PLANNING ASSOCIATION, LTD. (194,014). Registered November 27. 27, Victoria-square, S.W.1. To promote, develop, and improve housing and town-planning schemes of all kinds in Great Britain. Nominal capital, £1,000.

RAZIP MANUFACTURING CO., LTD. (193,973). Registered November 23. 38, Deansgate, Manchester. Dealers and manufacturers of Razip paint, enamel, varnish and mosaic cleaners. Nominal capital, £1,000.

J. W. JONES & SONS, LTD. (193,952). Registered November 23. Builders and contractors. Nominal capital, £12,000.

JEFFERYES & CO., LTD. (193,984). Registered November 24. 10, Lower John-street, Regent-street, W. Plastering decorators, builders and contractors. &c. Nominal capital, £2,000.

CAMEL ASPHALTE CO., LTD. (193,870). Registered November 20. To acquire lands, mines, quarries, minerals and slate dumps in the county of Cornwall and turn same to account, quarry masters and stone and slate merchants, &c. Nominal capital, £17,500.

BEN THOMAS & CO., LTD. (193,867). Registered November 20. Lon Fach, Rhiwbina, near Cardiff. Builders, contractors, civil, sanitary, mechanical and general engineers, &c. Nominal capital, £1,000.

COUNTRY HOMES, LTD. (193,846). Registered November 19. 49, Beech-street, Barbican, E.C.1. General building contractors. Nominal capital, £500.

TEMPLE & PYLE, LTD. (194,162). Registered December 3. Hill Heads, Whitley Bay, Northumberland. Builders, contractors and plasterers carried on at Whitley Bay, Northumberland, under the style of Temple & Pyle. Nominal capital, £2,000.

REGAL ASBESTIC JOINTLESS FLOORING CO., LTD. (194,156). Registered December 3. 42, Drury-lane, W.C.2. To carry on the business of builders' and contractors' flooring specialists. Nominal capital, £500.

W. CREIGHTON & CO., LTD. (194,194). Registered December 4. Cassiobury Mills, Watford, Herts. Builders' material merchants, timber merchants, coal and coke merchants. Nominal capital, £5,000.

PATENTS.*

APPLICATIONS PUBLISHED.*

205,342.—T. G. Rhodes and R. Gaunt: Combined valve and siphon-discharge apparatus for flushing purposes.

204,351.—A. Parks: Flush-cisterns.

204,356.—A. Rustige and C. Kuhn: Baths.

204,392.—Moler Fireproof Brick & Partition Co., Ltd., and B. P. F. Deane: Manufacture of articles from clay, diatomaceous earth, and similar mineral substances.

204,403.—I. W. Thomas: Fastening or catch devices for boxes or receptacles having hinged or pivoted doors or the like.

193,372.—H. Kontzler: Production of hydraulic cement.

204,487.—W. S. Akerman: Roofing-tiles.

204,490.—F. G. Price: Corrugated roofing-sheets.

204,516.—J. E. Miller: Angle concrete bricks and blocks.

204,517.—E. Carvell: Wall plugs or fixing-blocks.

204,535.—J. Skelton, Sen., L. J. Skelton and J. Skelton, Jun.: Built-up metal towers, particularly those for crane stagings employed in the construction of buildings.

204,539.—J. Lightbown: Coping and parapet cradle or platform carriage.

204,544.—Sir F. Lobnitz and Lobnitz & Co., Ltd.: Subaqueous rock-cutting apparatus.

204,567.—L. Lichtenfeld: Parquet flooring.

204,583.—M. J. Dark and H. A. Dawes: Enamelled metal ties.

204,604.—O. Cosins and L. Cosins: Brick-moulding machines.

204,618.—A. H. T. Hainselin: Manufacture of cement flags, paving-blocks, and the like.

198,327.—H. V. Whitlock: Rope structures.

204,656.—G. H. Walchli and Kant-Break Ladder, Inc.: Ladders.

186,598.—H. R. Bliss: Method of constructing packing-cases.

204,659.—J. McArthur: Vehicle sash constructions.

196,906.—Soc. Anon. "La Ceramique Nationale": Apparatus for the manufacture of patterned or fancy tiles.

205,547.—H. V. Potter, F. J. Robinson, A. Lloyd, and Damard Lacquer Co., Ltd.: Pottery, porcelain and earthenware.

184,167.—G. Borle: Process for manufacturing a material for moulded articles, plates and floor covering.

205,575.—R. M. Maunder: Domestic fire-grates.

205,591.—Sir H. Austin. Covers or lap plates of panels used in connection with doors or drawers, or for other purposes.

205,626.—F. Cross and G. Fabris: Door-locks.

205,640.—W. Green and J. H. Dean: Wall tie.

205,642.—L. De Brouckere: Drawing and the like tables.

205,647.—T. O. Owen: Paving of roadways and footpaths.

205,661.—J. M. Dossor: Chimney and ventilating-shaft tops.

205,665.—W. Pratt: Staging-attachment for ladders and scaffolding.

205,679.—J. W. Wood: Apparatus for moulding concrete.

205,688.—H. E. Steinberg: Moulds for reinforced-concrete flooring.

205,701.—A. H. M. Basart: Door fastenings for safes.

205,712.—C. M. Trautschold and R. E. Pellow: Trestles.

205,720.—W. P. Carpmael (Naamlooze Vennootschap Korrelbeton Maatschappij voor Woningbouw in Poreuze Beton): Moulds for use in the erection of concrete buildings.

205,728.—Pavement Publicity, Ltd., and W. G. V. Vaughan: Paving slabs and flags.

205,744.—C. P. Elwell and S. P. Wing: Wireless masts or like structures.

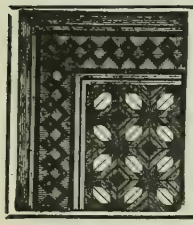
DIARIES & CALENDARS.

Messrs. Stone & Co., Ltd., of Nonsuch Fire Brick and Tile Works and Potteries, Epsom and Ewell, Surrey, have issued a useful waistcoat-pocket diary for 1924. In addition to the diary section, which is conveniently arranged with one week to each opening, there are several pages containing the usual information generally contained in diaries, and one page on which is given a list of the manufactures of the firm.

The Southern Counties Federation of Building Trades Employers, London, have issued a Diary and Year Book for 1924, containing a £1,000 Insurance Coupon.

From Messrs. Frank S. Mayo, 11, Queen Victoria-street, London, we have received a useful Daily Pad for 1924. From Messrs. Jenson & Nicholson, Ltd., Stratford, and Messrs. Young & Co., Westminster, we have received calendars respectively.



Messrs. N. Gerver, 204-206, Bethnal Green-road, London, inform us that on receipt of a trade card they will be pleased to send, post free, a calendar for the year 1924.

We have received calendars for 1924 from the following: Messrs. Lewis E. Nunn; The Ironite Co., Ltd.; The Ragusa Asphalte Paving Co., Ltd.; Mr. G. H. Carter; Joseph Freeman, Sons & Co., Ltd.; and Mr. Edward B. Holmes.

One of the handiest little diaries we have seen is that issued by the "Woco" Door Co., which is well arranged and serviceable in style and production. Incidentally, it will be none the worse for reminding us of the progress we are making in useful building materials.

We have received useful calendars from Messrs. Joseph Westwood & Co., Ltd., and W. H. Willcox & Co., Ltd. From The Ringmer Building Works a number of blotting pads; and from Kelly's Directories, Ltd., the Post Office London Directory for 1924.

The will has been proved of Mr. Alfred James Higley, of Herne Lodge, Severn-road, Weston-super-Mare, Somerset, retired builder—net personalty, £3,224; gross, £7,152.

THE BUILDER

A JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR.

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

VOL. CXXVI.—No. 4224. JANUARY 18, 1924.

THE ACCOMMODATION CHALLENGE.

MAJOR BARNES is fortunate in his moment for the appearance of his book.* It is at once a survey and a challenge, but because the survey is so conscientious, and the evidence amassed so exhaustive and detailed, the challenge gains in importance and is bound to make itself heard. Briefly, Major Barnes contends that private enterprise has never wholly met the housing requirements of this country, that in the present circumstances it is practically impossible for it to regain the efficiency even of pre-war days, and that whether we like it or not we are faced with a permanent State responsibility for housing the "working classes"; though he believes that the incidence will be gradual and not what he describes as alarming. It is this conclusion which will mainly attract attention to the book, coming as it does at a moment of political crisis rich in possibilities. No one can deny the competence of the author to deal with his subject; he has special knowledge and special experience, and, moreover, he possesses that art of concentration which devours every particle of evidence required to encompass the situation under review. But it is exactly here that the value of his judgment appears to weaken. Few sayings embody greater truth than that of not seeing the wood for the trees. Major Barnes sees the trees and classifies them with the enthusiasm of a scientist; but it is as trees that he sees them, and the forest in its relation to the surrounding country is overlooked.

He quite rightly asserts that the average working man cannot at the present rate of wages occupy a house of reasonable standard and pay an economic rent (including rates), even when he is in work. That this is a truth of extraordinary gravity and danger no one can deny, but it certainly can be denied that it implies the failure of the building industry in particular; rather, we contend, it is an indictment of industry as a whole—a failure which, if it persists, must involve the collapse of civilisation as we know it. The justification of the industrial principle depends on its ability to supply the public with the ordinary commodities of life, and also to maintain adequately the *personnel* dependent upon it and upon which it in turn depends. If it cannot organise itself directly to answer the demand of its own workers (and we are very far from suggesting that it has lived up to its responsibilities in the so-called "normal" years) and to support them with the means of life, even at the minimum subsistence level, including proper accommodation, then our civilisation is beyond hope. State help is no permanent cure for such a condition, however essential it may be in an emergency; by it the productive capacity of a people can only be weakened. In regard to the efficiency of State administration, Major Barnes is emphatic; he tells us that "such public provision is as a rule more expensive and less efficient and is, therefore, a regrettable necessity only to be accepted if it is inevitable."

Is it inevitable? We must admit that all forms of State help are an indirect subsidy to wages, and that in giving it the State pays for the casualties which industry fails directly to relieve. That certain burdens of industry are better "pooled" on public lines is undeniable, and it is the science of statesmanship to adjust the balance between State and industry for public services in special circumstances. As an example, some form of State assistance for housing after the war was clearly a national responsibility. There is, and should be, no set rule for deciding what is and what is not a special circumstance that cannot equitably be met by industry, but the principle that responsibility for the maintenance of its employees ultimately rests on the engine of production appears to us incontrovertible. In this adjustment lies the political arena of the future. Certainly our housing supply is at the moment very far from being self-supporting, but to assert with cheerful mournfulness with Major Barnes that after all public education did not destroy us, so neither need (very gradual) public rent subsidy, is to set up an unfair comparison. Education is a special charge on a special section of the public at a special time, which is best met and best administered centrally. State education strengthens a public responsibility that is entirely healthy and socially just, and it is admittedly efficient. Accommodation, far from being a special charge, is general in its widest sense, and instead of being better administered centrally is, even according to a sympathiser like Major Barnes, "more expensive and less efficient." If our productive organisations cannot recover and supply what will meet the accommodation rental, we cannot successfully substitute a permanent policy of small State workhouses. To us, we admit, there appears to be no heroic solution; it resolves itself solely into the wider problem of the effective wage and the ability of industry to provide it. Given the effective wage to pay an economic rent, the building industry will provide the houses more efficiently than any other agency to whatever standard the State and public opinion may and should impose.

We confess we are not hopeful of any such adjustment—for some time at least—being thought out and introduced on practical lines. Conflict and clamour are the enemies of reason, but some policy must be evolved probably associated with a form of national insurance on the broadest basis. The achievements of individual firms where they have been boldly executed in a social spirit have shown what can be done. Whether private enterprise takes the form of co-operation, profit-sharing, or the application of the "Whitley" principles, the public has learnt that good management is good business as well as good Christianity.

The fate of civilisation depends upon the fate of its citizens, and the ability to pay for a home is the hall-mark of independence. While admitting past shortcomings, we believe that industry will yet be able to justify her existence—as she has not hitherto done in the years of plenty—but she will have to set her house in order, and secure the independence of her own servants.

Although we have attempted to answer the particular challedge to the building industry, we may well thank Major Barnes for his amazing store of reference material, and for what we hold to be more valuable, the insistence on the gravity of the accommodation problem. We purposely avoid mentioning the word "housing" because the author tells us that "it is no part of this book to discuss the qualitative aspect of housing." Such an attitude is, in our opinion, untenable, since questions of cost are clearly involved. Also it encourages the idea that standard and architectural merit are unpractical, or anyhow do not necessarily affect practical issues, and such a delusion can only set back the cause of social reform, which is intimately connected with the size and character of our new houses. Apart from this criticism we believe that this volume will provide a valuable book of reference, one which no student of social conditions can afford to neglect.

NOTES.

Modern Architecture.

THE paper read by Professor Richardson at the Architectural Association on Monday night dealt with modern architecture and with the attitude we must adopt towards it if we are to produce a living architectural language. It was satisfactory to find that no single speaker said anything in favour of the existing state of affairs, neither did anyone deny Mr. Goodhart-Rendel's contention that we have precisely the architecture we deserve. It may be that every generation imagines itself to stand at a turning-point in the world's history, faced with unique opportunities, but very few have such excellent reason for such a belief as has the present one. A world upheaval is invariably followed by a period of energetic reform, and the question of whether war, with all its horrors and folly, is the only means of promoting this is one of the most difficult with which we can be faced. The attempt to understand the incomprehensible is always stimulating, but it must not be forgotten that inquiry into an art form, such as the source of beauty in architecture, is unlike a definite and limited scientific investigation in that there is no absolute answer.

The Advertisement of Architecture.

THE first annual general meeting of the Architecture Club was held on May 29, 1923, and now we have before us the first annual report, showing what are the activities of the club, and these may be pronounced a decided success for a first year's effort. It will be noted that "there can be no suggestion that the club supposes itself to include all the competent architects in the profession," and is only to be regarded as a small propagandist body. It is well that this has been stated, for the attempt to fix standards of quality is a very dangerous business, especially at a time like the present, when the distribution of awards and honours is so grotesque. We shall owe the club some gratitude if it helps to spread some enlightenment about architecture and architects amongst the public, and particularly if it clears away the fantastic notion that only those who are well known and advertised are capable. The promotion of the art of architecture is, of course, a great aim, and is not to be confounded with the advertisement of individual architects, however good their work may be. We want mainly to get the public to appreciate beautiful building and not to feel we are putting the well-being of the individual architect into the forefront of our propaganda. Hence, we wish the club all success.

A Notable Art Critic.

THE death of A. Clutton-Brock will be widely regretted as the loss of a distinguished writer and a man of sincere character. To his art criticism he brought that rare accompaniment of a synthetic approach, interpreting the deeper relations of art to life, and connecting it with those beliefs which give to it this fundamental endowment. His was no superficial approach, shaped on the fashion of the time or habit, in that his thoughts about art were ever placed on a background of human welfare, from which he surveyed it. Not too much concerned with catalogue numbers and the small change of ephemeral art criticism, he avoided any morbid attraction to extreme cults and the exclusiveness of schools, to preserve for art that intrinsic value which associates it with the virtues of a people, away from preciousness and professional pretension. It is not, perhaps, the time to gauge fully the value of his contribution and it will appear to some that his later writings showed a tendency to become hampered by a more pronounced doctrinal attitude, by some little loss of the common touch; a stage perhaps only temporary and preparatory to a wider comprehension freed from doctrinaire influences and piercing deeper those realities of which his earlier work reveals him to have had so clear a vision. Art criticism such as his is rare, nor will his place be easily filled. At a time when the unstable atmosphere of mere opinion so much prevails, the death of a man of pronounced and illuminated conviction is a real loss.

Protection of Churches. THE Report of the Central Committee for the Protection of Churches, the first issued and published by the Oxford University Press, gives an interesting account of the work of a very useful organisation, directed by a central organisation consisting of representatives from each Diocese. The proper care of our parish churches, which have suffered so terribly in the past, is a matter of such national importance, that it is most reassuring to know that some control and guidance through responsible advisers is now available, and that we may look for a security from the vandalism from which our churches have hitherto suffered. Not that the task of these Committees is at all an easy one. The once so acclaimed and orthodox Gothic Revival is now no longer regarded as such; we can see its works, and it is now judged by them. But in their desire to avoid the mistakes of the past and to secure that the average standard of work in churches shall conform to the restraints and traditions which are becoming to it, we must not conceal from ourselves the drawbacks lying in the nature of such Diocesan Committees of Taste, and though endorsing their usefulness at the present time, we may not afford to neglect the defects in all such bodies. Where taste only is concerned, their usefulness cannot be doubted. But the matter is not one of taste only, or to be settled by its decisions.

Taste and the Artist. COMMITTEES of Taste, owing to their strong adherence to precedent and antiquarian preference, their familiarity with the known, and with what has been good in art, are seldom safe judges of what is to be, and tend towards sterility, and when it comes to the consideration of creative work which in its nature will not conform to standards of taste so established, are prone to become an obstruction to the entrance of the new and abundant life included in the creative spirit of art, and are, therefore, hostile to growth. Taste and the antiquarian are useful guides, but not for new expression which holds its prerogatives from other sources, and we must be careful to remember that the office of such Diocesan Committees of Taste needs, in addition to themselves, the reinforcement of an independence and freedom of appreciation to include the new, the unknown, of personally endowed vision. We say this in no way to deprecate the present usefulness of these Committees which, we believe, are wholly to the good—until something better supersedes them. But for the clergy and laity it needs that they shall fit themselves to exercise a wise choice, gradually freeing themselves from such tutelage, and from the fetters of organisation, if there is to be a living growth in church art.

London Factories. ADMITTEDLY it is an advance when great factories are moved out of our crowded cities into the country, and the exodus made in 1920 by Messrs. Crosse & Blackwell was an important step very much in the right direction. It is, therefore, all the more regrettable to learn (from the recent published report on the company's position) that a move back to London has not only been recommended in the report, but is in process of adoption. Financial urgency is not one to be ignored, and the save in turnover is estimated at 4 per cent.; but, while we are not in a position to judge on the factors and circumstances that have led to the company's present situation and decision, we do most sincerely regret the failure of a policy which we had hoped might be a successful example to other firms. We can now only hope that the "model" factories to be erected at Bermondsey and on the river wharf will be equipped with up-to-date smoke consuming apparatus, and, further, that the company will make some housing provision for their employees in connection with this renowned and important business.

A Suggestion from Nature. DURING our recent visit to the Empire Exhibition we could not help feeling that the recent covering of hoar frost over the countryside emphasised the value of unity of effect in many congregated masses of building. Though the different forms of trees, bushes and hedges were left with their own distinct individuality, this covering of white frost produced an impressive breadth of effect. The universal white at the White City Exhibition was a very effective quality, and it is rather to be regretted that a similar result is not to be had at Wembley.

Academic Dress. THE small amount of support which has been given to the idea of a professional costume may have been due to the influence of the wives and daughters of architects, but the average male mind probably sees in the proposal something of too doubtful a value. Anyhow, the majority of three at a small meeting in favour of it is an impossible verdict, and if the idea is pursued it will surely be essential to have a referendum of the whole profession.

GENERAL NEWS.

Professional Announcement.

Mr. R. R. Wentworth Hyde, M.S.A. (Singer, Hyde & Son), recently returned from the East, has reopened practice as architect and surveyor at Worthing. Manufacturers, &c., are invited to forward catalogues of building and engineering specialities to No. 8, Heene-terrace, Worthing.

Liverpool Memorial Hall.

On February 10 the Lord Mayor of Liverpool will lay the stone of the Liverpool Memorial Hall, which is being erected on a site near the memorial to the 55th Division at Givenchy. The Memorial Hall has been subscribed for by Liverpool people, and will be used as a library, cinema, &c.

Swedish Art.

The first representative exhibition of Swedish art in London, we believe, is now being held at the Royal Academy, and at the private view on Monday it appeared to be highly appreciated. There is a feeling of freshness of outlook and method about the work exhibited which comes with much varied interest in comparison with our usual Academy exhibitions. In figures, pictures, portraits and landscape, there is much to arrest attention, and sobriety of treatment and decorative quality are apparent in many of the pictures. The arrangement of pictures in groups of the work of the various artists enables one to see more clearly the individual qualities of each. That we could find an equal amount of breadth and dignity in an ordinary British exhibition is, we think, doubtful, and it is evident enough that though it may suffer in certain respects from some geographical isolation, Sweden has achieved an honourable and distinguished position in the world of art. There are some admirable pieces of sculpture shown, and one could have wished for more; we certainly might have derived much interest from exhibits of craftsmanship had it been possible to have included them in the exhibition. The writer finds the type in the catalogue both troublesome and inartistic. Some of the striking qualities of the exhibition are, however, reflected in the illustrations of the catalogue, such as the fine "Winter Night," by Karl Nordström; "The Hunter," by Bruno Liljefors; and the convincing portrait of Z. Renholm, by Ernst Josephson. How simple may be the materials for a successful picture may be seen in "A Swedish Farm," by Gustaf Rydberg. Such a picture as this is real, and we have the feeling of being able to move about from the foreground to the extreme distance. It would take a long review to do adequate justice to this well displayed Swedish exhibition.

COMPETITION NEWS

Result of Mint Competitions.

The Royal Mint announces the results of a series of competitions, held during the past year under the auspices of the Advisory Committee as follows:—

1.—For the best design for an award medal to exhibitors (£70), Mr. Percy Metcalfe, London. 2.—For a design for a plaquette commemorative of the holding of the exhibition (£70), Mr. E. Carter Preston, Liverpool. 3.—For the Royal Mint open competition for models for plaquettes illustrative of London, first prize of 100 guineas to Mr. Eric Bradbury, London. Two second prizes of 50 guineas each to Mr. A. Howes, Kew, and Mr. Percy Metcalfe, London.

Prizes of 25 guineas were also awarded to the following for designs symbolical of London as the capital city of the Empire:—Miss M. Kitchener, The Little Gallery, Ashtead, Surrey; Mr. W. H. Doxey, 8, January-street, Chorlton-on-Medlock, Manchester; Mr. C. L. J. Doman, The Studio, 9, Spencer Hill-road, Wimbledon, London.

4.—Designs for a small keepsake medal of the size of a shilling piece. First prize of £50, Mr. Percy Metcalfe, The Studio, Cleveland-road, Barnes; second prize of £20, Mr. William McMillan, 65, Glebe-place, Chelsea; third prize of £10, Mr. Langford Jones, 67, Shakespeare-road, Hanwell.

Foundation Stone.

Designed by Mr. H. C. CORLETTE, F.R.I.B.A.

[This stone is placed as a panel let into the base of one of the piers of reinforced concrete in the portico of the principal entrance to the College. Messrs. Foster & Dicksee, Ltd., are the contractors.]

Newcastle Concert Hall.

The sending-in day for this competition is Saturday, March 1, and not February 1, as advertised.

Talbot Memorial Park.

Design for a Lodge and Main Entrance Gates. A premium of 20 guineas is offered, and the successful architect will be engaged to supervise and carry out the work. Sending-in day, January 20.—*Banned by R.I.B.A.*

Coatbridge War Memorial.

The assessor, Mr. James Lochhead, F.R.I.B.A., has made the following award in this competition: 1.—(£75), Mrs. Edith Burnet Hughes, 27, Ashton-terrace, Glasgow, W.; 2—(£50), Messrs. Denny & Blain, architects, 144, St. Vincent-street, Glasgow; 3—(£25), Mr. Newbury A. Trent, 1, Beaufort-street, Chelsea, S.W. 3.

Newcastle Fire and Police Station.

Newcastle City Council have decided to hold a public competition amongst architects for plans for the proposed new police and fire brigade station on the Marlborough-crescent Market site. Buildings are to cover 2,465 yds., leaving the remainder for an open court yard. Exclusive of the installation of alarm system, the estimated cost is £12,500. Three prizes, amounting in all to £900, will be offered for designs, and an assessor, nominated by the President of the Royal Institute of British Architects and approved by the authority, will be appointed at a fee of £281 10s. to adjudicate.

Other Competitions.

Other competitions still open include the following (the dates given are, first the sending-in date, and second the issue of *The Builder* in which full particulars were given):—Newcastle Memorial (Jan. 5; Sept. 14. 1923). Essays on Heating and Ventilating (Mar. 31; Nov. 9, 1923). Holmside Hospital (Feb. 14; Dec. 14, 1923). Industrial Designs (June; Dec. 21, 1923). National Theatre (April 26). Monument to Sir Wilfrid Laurier (April 3; Dec. 14, 1923). Belfast Union Lighting (March; Nov. 9, 1923). Dunfermline War Memorial (March 8; Dec. 28, 1923).

Bank at Barcelona, Spain.

[A reinforced concrete building with concrete-block facings.]

THE COMPLEAT ARCHITECT.

By DUDLEY HARBRON.

XIII.—Wholesomeness.

It is not popular to talk of wholesomeness to those who associate the picturesque with squalor. There are some poets and many artists in paint and words occupied in gilding the dust by their sedulous lauding of ruins and decay. Their influence is widespread, their appeal insidious, so that it is with difficulty that our minds, accustomed to find solace in the contemplation of the deserted village, can be brought to regard with favour the regulated garden suburb. We are depressed by the present ill more fully than by those we know not of. As a contrast to these people, who find so much superficial interest in grime and smuts, there exists another school, who can find little good to say of many aspects of modern life. The former are romantics, the latter realists: both of them are right. A writer who seems to unite the two qualities, Mr. Stoughton Holborn, in his very interesting book, "The Need for Art in Life," states the case concisely:—

"Can we approach the modern city and say that it looks like a jewel in the surrounding landscape, or must we rather say that it is like some festering sore, spreading its smoke and chemical fumes and destroying the vegetation for miles around? . . . Look at the ugly factories, the ungainly warehouses, the mean streets and drab costumes, and, above all, the squalid and appalling horror of the slums."

We have only to open the morning paper to find some crudely reported incident which reinforces, if reinforcement were necessary, the general truth of his picture. Only the other day we were told in plain words, with appropriate comment, the story of a woman who, having stolen some fish, sought to hide her culpability in the cellars of Les Halles. She forgot the cats, to which the basement of the Paris market is given over. The cats attacked her, and she was forced to issue from her hiding-place short of her fish, dishevelled, and bleeding. Could anything well be more disgusting, and yet there is not one word of comment that could lead one to suspect that there were anything unhealthy in such an incident. It will hardly be credited, but a reporter of this news found it funny! Such of us who live remote from the slums and ruins must not forget their menace. Unless architecture respond to the growing knowledge of the present of the need of health for life, it will have failed in the most cruel respect in consideration for the welfare of our fellow-men.

If we approach Mr. Holborn's city, past the leafless withered trees, the first sensation we experience, through our eyes, our throats, our nostrils, is the smoke, belching from countless chimneys. Activity! dreams the poet. Atmosphere! exclaims the artist. Pollution! answers the doctor. From their different angles all of them are right. The drifting haze does lend a wistful charm, so that we glimpse but shades instead of stark reality. A clear sky would reveal more crudity than we care to contemplate. None the less, men are more important than machines. The obvious waste of life in leisure to men, caused by being needlessly compelled to inhale impurities, continually to clean the ever-settling deposit of dirt on one's person and possessions, though it may entail expenditure in improvement of manufacturing methods, would more than be met by the saving in hospitals and gaols. Comically we bracket wholesomeness with hospitals, instead of making it so general that their services would not be required.

Architecture, if it is to be complete, must take cognisance of the absorbing need to promote an atmosphere within and without favourable to health. We are only just realising the full effects of our neglect to safeguard the integrity of those two essential requisites to existence—light and air; because they are free like the sea is no reason why we should cloud with carbon, pollute with sulphur, the atmosphere, or besmear our beaches with oil. If such evils are permitted to increase unchecked, life will not be worth living, if life were possible. Naturally such a sentiment will have far-reaching effects: chimneys will become as redundant as machicolations; let us hope that they did not linger so long after their use had ceased to be.

The provisions for lighting and ventilation of buildings are those which should most effectively regulate their proportions; the width of the rooms and their disposition should not be solely considered from the standpoint of intentional disposition, but should respect the need of their occupants for the necessities of life. It should not be left to a draper's assistant to have to write an article in the *Draper and Drapers' Times*, pointing out the unsuitability of basements as shopping centres. Architects who would scorn to be guilty of consigning the staff of a gentleman to the bowels of the earth to live, or to sleep among the roof spars, should now be mindful lest, having learned one lesson, they fall into kindred error, and relegate assistants and customers to a region where light has to be manufactured and air forced. Headaches and pale faces can only result at the mildest computation.

Whilst wholesomeness is needed by the occupant it must not neglect the onlooker. "Do unto others as ye would be done by" is still capable of revolutionising the world. Our neighbours' rights should not need the protection of the law.

Not only is building affected in this large manner by a regard for life: it is reflected, or should be, in the minute detail which, assembled, composes the structure. The persistence of parts and features appropriate to a clear climate have little to recommend them in one naturally humid as our own, more particularly as at present contaminated by smoke. The environment of plough lands and the prevailing winds will always carry a certain amount of foreign matter in suspension, and this, finding a favourable lodgment in nooks and crannies provided to give light and shade, ends in their rapidly losing the original power so to do. Respect for the canon of cleanliness entails a consideration of their conformation so that the cleansing properties of wind and rain shall be assisted and not impeded. That where their agency is not afforded the human hands which have the work to do shall find that the task has been lightened. If architects think more and always of these things there will be great hope for the art.

The disregard of wholesomeness is the opportunity awaited by those agencies of destruction, rot and rust.

Leicester City Rebuilding.

At a recent town's meeting a scheme to practically rebuild the city at a cost of £3,000,000 was defeated by the narrow margin of 679 votes to 532. The scheme, it is stated, has only been before the City Council for twelve months, and as a large number refrained from voting, the matter is as yet by no means settled. The enterprise can be described as popular in that it appeals to most of the leading men, the exponents of public opinion, and a certain proportion of the ratepayers. The work could not be taken in hand all at once. It would be set about in sections, one portion being completed before another was begun. In this way it might take 50 years in the doing.

DETAIL OF FRONT.

Working Drawings by MR. C. E. THOMAS; Design and Supervision by MESSRS. T MACLAREN & T. D. HETHERINGTON.

CORRESPONDENCE.

The Menai Suspension Bridge.

SIR,—In suggesting that tenders be obtained for strengthening the Menai suspension bridge, as an alternative to the erection of a new structure, Mr. A. H. Stott may not be aware that, according to the statement of Sir Henry Maybury, of the Ministry of Transport, "a careful and detailed inspection of the bridge" revealed "increasing signs of fatigue and decay. The deterioration was accelerating, and the present bridge could only be maintained by a heavy annual increase in maintenance charges coupled with a further reduction in the tonnage permitted across the bridge. By those means the alternative of constructing a new bridge could only be postponed for a few years."

With regard to the broad question as to the suitability of reinforced concrete for the proposed new bridge, may I remind Mr. Stott that if the same prejudice against the use of a new material had existed when Telford's bridge was built that "graceful structure" (to use your correspondent's own words) would never have been built? It seems to me that a new material, when found suitable for a specific purpose both on the grounds of cost and strength, must be accepted, and it is the duty of architects to design beautiful structures in the new material. I enclose two photographs of reinforced concrete bridges, which, I think, amply prove that "graceful structures" can be built with this material if the designer sets out to make them so.

London. H. C.

Rolled Steel Joists.

SIR,—The writer of the article, "Advantages of the New Steel Joists," in your current issue, commenting upon these sections, claims for them more than the facts warrant. In each case in which, by example, he shows these beams to be better weight-carriers, the depth of the new is greater than that of the old beam with which it is compared. Generally for beams of similar section, economy as carriers of weight is proportional to depth, so that these results are to be expected. For joists not strictly similar, an economic index figure is given by :—

$$\frac{\text{Modulus of section.}}{\text{Area of section.}}$$

Applying this to the old and new 12-in. by 5-in. joists we get 3.895 and 3.906 respectively, a difference of 2.8 per cent. only in favour of the new, the web of which it should be noticed is thinner.

Consideration of the above will explain why it is that engineers so commonly clamour for depth—more depth.

America's Westminster Abbey.

SIR,—It is interesting to learn that America's new national cathedral to be built at Washington, at a cost of £10,000,000, will be Gothic, similar to our Abbey, with the exception of the centre tower—which will be carried up and pinnacled—and the chapter-house planned near the south-west tower. After the flood of gush a few months since on Wren's pagan temples, this should be particularly gratifying to Pugin's disciples.

Weston-super-Mare. E. VALE.

"Mezzanine."

SIR,—Some years ago, while crossing Bayswater-road, the above term came into my mind and has stuck fast ever since.

At the time I was considering the best form of roadway-street for cities, and this may be said to be the first time I have put pen to paper on the subject directly.

During the memorable conference on town planning in London, in 1910, a Frenchman proposed what may be termed the "tier" street, which, I believe, consisted of one line of communication above the other, but wholly underground.

"Mezzanine" may be taken as a development with the top tier projecting in some degree above the surface level of the side pavements and with its roof forming a roadway in itself.

The lower ground levels or basements of the structure on either side might then have a pavement the same width as the normal pavement above, and be thus the better available for business purposes; whilst the lodgement of the service pipes, cables and wires could be suitably arranged.

The question of the crossings and points in such a street as described seems at first to be one of the utmost complexity, until it is resolved to make some of the former *cul de sacs* for wheeled traffic and to arrange the latter as a one-way-street with traffic "flying off at a tangent" in the direction it desired to proceed. The diameter of the one-way circular street might be considerable, and be filled in with a structure rising to a great height and capable of being used as a traffic centre and otherwise as a public place.

O.B.I.T.

Problems of 1924.

SIR,—It is encouraging to find that, under the above title, you are of the opinion that the state of the building industry cannot be considered without touching upon political issues. The social spirit which places public interest before private advantage is gradually taking the place of the old-time game of politics, and decent-minded people now consider "programmes" without being affected by cheap jibes and newspaper stunts.

It is said that architecture reflects the state of contemporary civilisation. Surely the influence of architecture need not be so negative as all that. Architecture ought to be quite capable of leading the way in moral thought. As custodians of the Mistress Art, architects have a power to lead, which is not even second to that of the decent politician who puts the State before private gain.

You very rightly remark that "up to the present, this country has taken a mild pride in the fact that the Government has done less than almost any other in fostering the arts or even recognising them in any shape or form." Things are now changing. Oil companies are taking down their beastly posters over the countryside. A political leader has publicly uttered what most of us have been thinking in private or only in books up to the present—that private individuals should not be allowed to use a national housing shortage as a means of raising artificial prices. The same political party, if given the opportunity, will patronise the Arts in the highest sense of the phrase, so that private opinion may be enriched by the Arts.

If the architect is a man or woman worthy of his training and true to his ideals of good building, he should be acquainting himself with the problems of the human beings, who are the setting to his architectural compositions.

Architects who are, or ought to be, the guardians of the Nation's moral welfare, cannot entirely keep out of politics these days.

ALISTER G. MACDONALD.

TOWERS AND SPIRES.

II.—Tower of St. Front, Perigueux.

BY SIDNEY TOY, F.S.A., A.R.I.B.A.

As mentioned in the previous article, it is proposed in the treatment of this subject to confine attention to the examination of towers with spires erected over the vaults or central crossing of buildings. It is in these positions that the greatest structural difficulties were encountered, and it is here, therefore, that the examination will be attended with the greatest amount of useful instruction to the architects of the present day. In the case of towers with spires raised directly from the ground the dynamic problems are relatively simple and, generally, instances of this kind will be referred to only where they present analogous features of contemporary date or show conspicuous skill in structural treatment. In the case of central towers built of stone or kindred material, the difficulty of providing adequate support for both vertical and lateral pressures, without causing undue obstruction to the space below, is very considerable, and the architect must choose between external effect and internal convenience and beauty. But in edifices conceived on a large scale, well designed and skilfully built, a tower in this position forms an agreeable point of concentration dominating the whole structure and bringing all its parts into one group.

One of the earliest existing examples is that built over the vault of the "Latin" or more ancient part of the church of St. Front at Perigueux.* This tower stands over two bays of the church—which now forms a kind of narthex to the notable Byzantine addition with five domes—and rises to a height of 200 ft. (Fig. 1). Before beginning the erection of the tower proper the two bays of the church on which it was to stand were considerably strengthened and the work carried up to a height above the roof level to form a base for the new structure. Upon this base the tower was built in two tall receding stages and crowned by an open lantern with a conical stone cupola. Each of the two stages is pierced by two tiers of windows and is divided on all faces into three bays, the lower stage by wide pilasters, and the upper by engaged columns. Internally, the walls of each stage considerably overhang those of the stage upon which it stands; and the second stage, at the level of the upper cornice, is covered in by a hemispherical vault. Above the vault the angles of the square tower are stepped back externally to form the base of the lantern. The lantern is circular and has a colonnade of forty-eight antique columns, which stand upon a circular podium and support the conic cupola. These columns have evidently been taken from Roman buildings and are of varying diameters and heights.

It is difficult to state precisely the origin of the design of this tower, though it is Romanesque in detail. Probably it was the work of an intelligent architect of Perigord who was conversant with the campanili of the Venetian State, between which and Southern France considerable commercial intercourse existed at the period, and who in building a campanile of similar character adapted to his purpose the principle of superimposed orders he observed in the Roman Amphitheatre at Perigueux itself. It will be observed from the above brief description of the tower that its constructive principles are rudimentary and weak. The walls of the upper stage recede so much behind those of the lower that the engaged columns of the angles of the former stand partly above the arches of the windows of the latter, thereby increasing the thrust of these arches and their tendency to throw out the angles against which they abut. Again, the thrusts of the vault at the summit of the upper stage, thrusts which are greatly accentuated by the weight of the heavy lantern above, have apparently no other restraint than is offered by the walls against which they act. Some security was indeed provided here in the segmental arches of the upper windows which were actually lintels and arches in appearance only. These lintels, however, cracked under the forces to which they were subjected, and no longer fulfil the rôle of ties for which they were designed. There can be little doubt that, in conformity with the almost universal custom during the Middle Ages, both in the Levant and in Western Europe, timber ties were buried in the thickness of the walls between the tiers of windows, and that it is to this circumstance that the tower owes its stability. Notwithstanding this it has been found necessary for further security to partially block the upper tiers of windows and to build up entirely most of the square openings of the lower stage, as will be observed in Fig. 1. The external face of the cupola over the lantern is cut into a series of scallops which present a scale-like appearance with the scales pointing upwards. This is not primarily a decorative feature, but is provided in order that the rain water as it passes down the face of the cupola should be thrown clear of the vertical joints of the stonework, as shown in detail in Fig. 2.

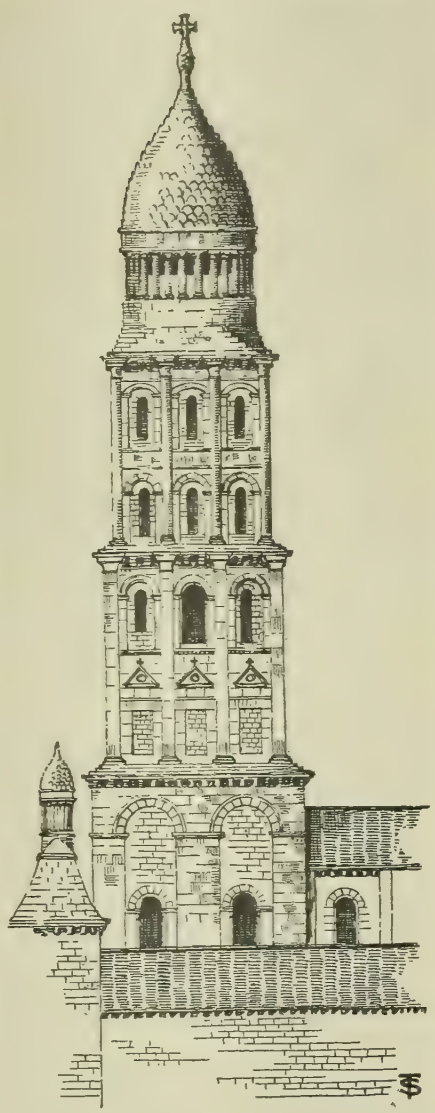

Fig. 1.—Tower of the Church of St. Front, Perigueux.

The tower over the crossing of the church of Notre-Dame-la-Grande at Poitiers and the central tower of the Abbey of Sainte-Marie-des-Dames at Saintes, near Rochefort, both present features of somewhat similar character to the tower at Perigueux, though they are later in style and detail and show considerable improvement in construction. The tower of Notre-Dame-la-Grande is built over a rectangular crossing and consists of two stages surmounted by a circular lantern with a conical roof (Fig. 3). The upper stage is pierced on each side by twin windows, which are sufficiently narrow to allow space for wide, solid masonry on each side for their abutment. The lantern is divided into six panels by engaged columns which ascend to the corbel course of the conical roof and each panel is pierced by twin windows. The manner of treatment of the broaches over the angles of the upper stage shows a great advance from that adopted at St. Front, Perigueux.

At Sainte-Marie, Saintes, the disposition of the tower is somewhat similar to that at Notre-Dame, Poitiers. Here, however, the work is much more elaborate and richly decorated. The stage above the roof line is pierced on each face by arcades of three richly decorated openings. These are of three orders and the inner order being relatively narrow, the clustered piers and responds are of a substantial character. As at St. Front, this stage is covered by a hemispherical vault, but in order to increase the resistance of the angles to the thrusts acting upon them the broaches above are loaded by pinnacles; this again shows an advance in the knowledge of constructive principles. The lantern is pierced by twelve round-headed openings of two lights, each opening being separated by engaged columns as at Notre-Dame, Poitiers, and is covered by a conical roof with a slightly convex surface. This roof has also the scale treatment shown in Fig. 2.

*M. Viollet le Duc ascribes this tower to the early years of the eleventh century; though Mr. Phené Spiers, in his monograph of St. Front, Perigueux, refers the structure to a period subsequent to 1120. It is difficult, however, to associate the general character of the tower with this later period.

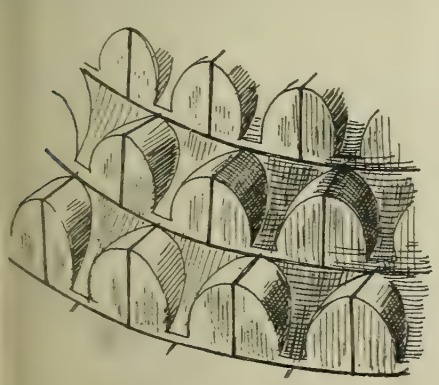

Fig. 2.

Fig. 3.—Tower of Notre-Dame-la-Grande, Poitiers.

MR. E. STANLEY HALL, F.R.I.B.A. (President), occupied the chair at a general meeting of the Architectural Association held at 35, Bedford-square, W.C., on Monday last.

New Members.

After the Minutes of the previous meeting had been passed and signed, the President announced six nominations for election to membership, and the following were unanimously elected new members :—

F. J. Watson.	E. L. Thompson.
S. L. Thomson.	R. B. Bana.
W. T. Lord.	G. H. H. Heritage.

THE RENEWAL OF VITALITY IN BUILDING.

PROFESSOR A. E. RICHARDSON, F.R.I.B.A. (Professor of Architecture at London University), then gave an address entitled "The Renewal of Vitality in Building," in the course of which he said the first quarter of the twentieth century was nearing its close, and the activities of those who had lived and worked during this exciting time stood clear. There was no need to recount past and current history, other than to make the statement, which they already knew, namely, that newer theories respecting building were, in every country, their own included, finding ready acceptance at the hands of earnest men.

They lived in the present and could not change or affect the present, but they could alter things for the future. That was their right and their duty. It involved a measure of self-sacrifice, a break from comfort, and a forceful severance from the filthy litter of custom. The incentive to emulation offered by the experiments and aspirations of other countries would not alone prove sufficient. Those experiments represented a viewpoint both enterprising and laudable, but the results had nothing in common with this country. The revitalising process would not come from abroad; the task was theirs and theirs alone.

He ventured to suggest that the development of sound theories, both intellectual and scientific, depended upon the schools and coteries of builders trained in the schools. It was his firm belief that England would eventually secure the leadership in all that pertained to the scientific art of building. They had to aim at collective effort as opposed to individualism. They were faced with the realities of modern life, and the whole range of economics. There were in addition such humane considerations as town and regional organisation. They had to consider in their special sphere the sources whence the profession of building drew its sustenance. They needed to pay more attention to technical considerations, and those essential to the comfort and well-being of their fellows. Building was no longer considered to be a matter for idyllistic experiment. It was now looked upon as a scientific art tending more and more to rely on expert knowledge of use and function for articulation. There was, for example, the study of acoustics, which implied the evolution of new forms for auditory chambers, as well as other branches, such as heating, lighting, and ventilation, all of which raised minor issues that in turn affected the scheme. In time civic authorities would draw up regulations whereby the existing by-laws would be augmented by others which would include the control of the main lines of building expression in the streets. Ten years hence this suggestion would be a reality.

As chief builders it was demanded that they keep before them a picture of past and present achievement, not only regarding the narrow limitations of their own calling, but a perspective of reasonable angle, which connoted all the arts; moreover, there was the question of paramount importance—the study of humanity.

The viewpoint to be aimed at was almost beyond their capacity, but nevertheless they should attempt its realisation. Other considerations included the preservation of amenities in town and country, the repair of historical buildings, and the fostering of interest in everything worthy of interest. The precision of modern building methods, particularly the handling of material, had not produced a definite departure from, or improvement on, the aspect of the conventional scenery. The buildings of the present, despite the care of the designer, and the labour of the workmen, were, with possible exceptions, listless and dull. Mere scholarship had not produced the desired result. How, then, could the revitalising process be attempted ?

The theory of building was gained in one or other of two ways : to some it was an abstract gift, amounting to intuition, which grasped the idea without effort or inquiry; to others less fortunate it was a question of a study of technicalities, and was attained by reasoning and experience.

Building was an affair of the intellect; primarily the term implied structure, secondly it connoted form, which was the natural outcome of structure, and responded directly to intellectual impulses; the third division was concerned with detail and colour. Structure, form, articulate membering, and colour had collectively and at all times determined the dominant characteristics of building. Those factors, as well as others of a subsidiary nature, had played their part in producing the concrete ideas which in bulk survived, and in all countries formed the conventional scenery, amidst which mankind had lived and moved. On such reasoning could be accepted the idea that building belonged to the intellectual side of human achievement. It was an outward and visible expression of the varied inspirations which from the earliest dawn had possessed mankind.

Gradually through the ages a system had been evolved, subjected it was true to all kinds of cross-currents, but retaining traits of humane significance. From the best of the impulses of the past, brought into being by force of circumstances and the intellectual efforts of nations, had survived ideas both forceful and logical. In that was to be seen the intellectual message projected from remote antiquity to the present, a message concerned with primary ideas and forces, and not to be confused with stylistic renderings.

To-day there was urgent need for renewal of vitality. They had reached a point where it was no longer possible to draw upon the reserve strength of the past to perform present-day functions. This was an age of introspection, with the whole sphere of research open to study and emulation, but they were forced to recognise the very narrow limits imposed on the development of building as a scientific art, if time-honoured methods alone were pursued. Granted the intellectual aspect of building, the need for historical reference as well as considerations both spiritual and emotional, the fact became insistently clear that something else was wanting. What was it ? Was it increased technical knowledge ? Was it greater proficiency in artistry, or some other factor to add to the complexity of their undertakings ?

The truth was that none of these attributes singly would help in the revitalising process. It was impossible to return to conditions that were obsolescent and out of harmony with the newer forces which were daily taking effect. They were gradually becoming accustomed to the thought that their outlook as builders needed broadening. It was a necessity with which they were faced. No longer was it considered good manners to speak of art and art alone; on the contrary, they were confronted with realities which demanded vital expression. Hence the need for a new viewpoint.

All buildings worthy of the name, irrespective of size, style or period, owed their qualities as such to the fact that use and purpose controlled the ultimate form. Structure, therefore, implied the geometrical arrangement of the spaces enclosed and connoted both form and function, horizontally, vertically and in a lateral sense. A building conceived on those basic principles, which had their origin in the beginning of things, was beyond question an intellectual achievement. It was structurally sound and functionally articulate in direct ratio to the statement of the plan formation.

The geometrical arrangement of the plan, with its nucleus and appendages, its circulation and conveniences, its voids, solids and vistral effects, each and several, made up the articulation of the structure. There were considerations of support and distribution, the legitimate use of materials, the calculation of mechanics, and other factors, all of which needed control if they were to be employed to assist the general effect. It was not possible for the architect, as a preliminary, to do more than marshal these latent forces in correct order; but an observance of such elementary factors would do much to produce a complete building.

The architect had, therefore, to follow the axiom that function and use were the factors which conjointly determined structure. It was a law present in all good building, irrespective of traditional usage. The more closely that law was observed the better the structural articulation and in varying degree the intellectual status of the building expression.

Form was the true manifestation and reflection of structure. The experiments of the nineteenth century, and after, illustrated the growth of complexity, in the main muddle-headed; a sort of unsuccessful groping after the secret of building through the manifestations and examples of form without sufficient and searching inquiry into the nature of function. While on this point the idea could be advanced that the primary theory of use and function allowed of licence, such as the flowering o detail, membering and decoration, the main structural attributes remaining intact and insistent. The designer who aimed at the true secret of building was one who was gifted with the instinct to rely for strength and ultimate effect on the inherent structural attributes of the fabric. The pre-classical civilisations in a great measure produced buildings of vast scale, representative of religion and military routine. They were not of high intellectual value. It was as though myriads of insects had been at work listlessly and without inspiration. The universal law of form in building arising from structural necessity and usage was common to all art. It was a law that brooked no interference; in the realm of building it had ever been present, and crystallised the intellectual impulses and culture common to any branch of art. If that law were ignored, building descended to the level of mere decoration; it lost its vitality and reason to be. Then the cross-currents of style, exploitation, and experiment in fantastic shapes took effect, the result being a species of Babylonian confusion. Building, of all the arts, relied primarily on the faculty of reasoning, which was the basis of design.

Buildings of European origin, from the age of Pericles to the latest examples of the Renaissance in the United States, in the main expressed the cool calculation and intellectual grasp of the building theory of function, combined with a dominant taste for decoration. The monuments of pre-classical days and later, in the East, from Assyria to India, appeared to have arisen in response to impulses that decreed

form to be more important than structure. The buildings of India in particular which to-day were receiving considerable attention from architects had no structural vitality. The silhouette and the form of the exterior represented a piled-up mass of material, interesting as abstract forms, but still-born in every other respect. They were creations stupendous in idea, but devoid of the vital spark. It was a style which had for its dominant expression the cult of cruelty and the subjection of humanity and individuality—a creed eloquent of the Hindoo religion and spiritual outlook. On such reasoning it must be conceded that the structural quality was vital to all building and sustained development of art. It was no longer possible to return to primitive ideals or to revert to primary forms, neither was it expedient to attempt, as heretofore, to exploit stylistic tendencies. Building as a living and vital art to-day had almost ceased to breathe. It had scarcely any reserve strength, and was at the mercy of every whim and fashion. They were seeking to escape from that species of *cul-de-sac* into which the thought of two eminents during the past century had diverted action. Among the many difficulties which beset them as builders was the fact that, apart from the necessity of building well and structurally, none recognised that a compelling interest was at hand to assist. The Greeks had the development of intellect as their ideal, the Romans had the lust of power, the Byzantine Greeks the impelling force of fusing eastern and western thought, the mediævalists the spiritual influence of religion, the artists of the Renaissance the revival of classical thought, which began in the fifteenth and lasted until the opening of the nineteenth century. The development of scientific research in the nineteenth century swept aside all idealistic leanings; the arts were relegated to a minor place; hence the furtive, but not quite abortive, revivals which in every country practically followed the same course.

Form, as understood, and culled from historical *motifs*, was forced to envelop structural arrangements, much as an extinguisher was placed over a candle. They were just beginning to apprehend the effect of that disastrous policy, which was not confined to practice in this country alone, but was the heritage of France and America. They were all guilty of the practice. Many beautiful buildings had resulted from such introspective study of the past, but that which appeared correct in the days of Sir Joshua Reynolds, and later of Cockerell, Pugin, Scott, and Ruskin, would afford little assistance at this crisis, when the need was delivery from the maze in which all the aspects of building were ensnared.

There were those who thought that the war would have swept away the old shibboleths, and that a new heaven and a new earth would be ready for enjoyment. Others opined that an expansion of commerce would provide the avenue for improvement in building matters, and yet others thought that salvation would come from America. The old habits and the slipshod methods had with few exceptions been followed; it had been a policy of despair, especially for the hackworkers and the journeymen. The issue before architects to-day was the definite one of studying and interpreting realities. The impelling interest was present; it had ever been present, although shadowy and scarcely realised. What was it? It was the interest of humanity, the study of one's fellows, whose needs, ambitions, emotions and struggles demanded assistance and comfort from the arts. Close and careful experiment with old forms and models might lead to a perfection of what was already known regarding stylistic expression; but the results were doomed to be soulless and unintelligible to the mass of opinion. What should they think of a painter who deliberately affected the style of Reynolds, Romney or Masquerier, other than to gain knowledge of technique? Yet architects in every country appeared to be content to strive after the shadow and to lose the substance. No past *motif*, however pleasant as building, or detail, could be accepted as the basis of a modern departure. It was structure and structure alone that would provide the germ of the new style, which, after all, was a very old one. Their intelligence should, therefore, be directed not to the theory of form, but to the theory of structure, of use, function and necessity. The minor attributes would take care of themselves. Theirs was the task to rescue the scientific art of building from foundering in the slough of ineptitude, to which the art had been led by over-observance of complex conditions. This was not the time for historical essays in material, however brilliantly conceived and executed; no paper facility would atone for lack of vitality and unobservance of structural necessity. The need of the moment was for a creative impulse based on present-day wants, having as its purpose the control of conditions that were fast becoming chaotic—more chaotic and perplexing than they were a century ago.

Foreign attainment and advance must be noted and weighed. There was plenty of scope for individualism, but individualism was dangerous; in like manner, the pursuit of idealism for the sake of spectacular effect must be curbed. Building must be studied by coteries of specialists with the end in view that vitality of expression was desired, closely representing the finest aspects of every-day life. Art must be entered upon on the big scale; no pains or time or expense could be spared. It must be understood that building embraced many crafts, that mere precision in the handling of materials would not produce the desired result, and that individual genius alone would not suffice to bring about the change. Again he would make the allusion to the value of schools and coteries as opposed to the isolated efforts of talented practitioners, whose time was rightly given to their individual work.

The architect who relied on form alone to express his ideas did not succed in producing results that were convincing. In general he sought to obtain interest by increasing the complexity of the detail and minor parts. But buildings that were entirely satisfactory were not produced in that way. No good could accrue if the latent forces were ignored. It was not a matter of richness of surface or scenic effect, but of the expression of the fundamental shaping of the building horizontally, vertically and laterally, having in view the articulation of the innumerable forces which were latent in every part of the structure. The addition of ornament, meretricious or otherwise, unless it were devised with the greatest care, would only confuse the issue. Detail that was studied and bookish would not assert the ultimate expression of use and function. If it were employed for pictorical effect it would only act as a delusion and a snare. In this country for over a century the making of books and the pursuit of research, with the building up of an almost incomprehensible repertoire of style knowledge, had obscured the finer vision of architects to the intrinsic merits of structural evolution.

It appeared as if present-day designers were handicapped by a chronic ineptitude for dealing with present realities. Once this simple truth were realised building would advance with renewed vitality and spirit.

What was wanted at the present moment was an entire reconstruction of the body of building; nothing else would suffice. Fine as the European tradition was, with its many excellent examplars of form, it had been found by experience to be closed to expansion; in other words it had reached the conventional limits imposed by the observance of the classical forms, which underlay its manifestations. They were bound, however, to observe certain of the laws which past achievement had made clear. It was not possible to discard them altogether, but it was equally certain that English builders and artists could no longer submit to the tyranny of the Mediterranean.

The fault of the building work of to-day was that in the main it bore no relation to everyday conditions. At its best it was scholarly to some degree, but it was contradictory: it was a law unto itself, but outside its sphere of action it was not understood. The public were in doubt as to what the parade of knowledge meant; hence the perpetual reactions and changes made by designers to achieve fashionable notoriety. True building, that was to say the observance of the theory of structure, should be above the tendencies and fashions of the moment; it must be neither vague nor dazzling; on the contrary, its message should be one of clarity. Until modern building regained the quality of articulation, until the idea of use and function became accepted as the only means whereby definite expression could be gained, all talk of a new style was so much nonsense. Buildings must have something to say, but the lesson should be definite: there must be the expression of purpose combined with spiritual impulses, the finesse of artistry and the rays of logic. The English character was the finest of its kind in the world, but English builders appeared to have lost, let it be hoped temporarily, the power to express that character. They had been too self-sufficient, too confident, too inadequate altogether to rise above worldly surroundings. Some had thought that interfusion and association of past ideas would be productive of great results. Such thoughts had been proved fallacious; they had seen the effects of such ill-advised doctrine in recent works in the streets of London—a greater complexity and muddleheadedness.

Revitalised building would depend entirely on the handling of the definite principle of structure, which in turn would draw its support from the logical employment of materials. In that way, and in that way alone, would the correct articulation of structural forms assist the evolution of a humane style of building, one answering the needs of the moment and worthy of being handed on to posterity. Fantasy or external novelty should be avoided. The realisation of a perfect building was no chance affair; no trick of draughtsmanship or artistic skill, no bookish lore or apish copyism of foreign ideas, would effect the desired result. Clarity of articulation was the only way, and the principle of intellectual penetration must be adopted. Architects had created a wall that shut out the public, and from behind that fastness they threw out ideas that had no reality in the world of facts. No progress was possible in that way; it was a mediæval method, one entirely unrelated to the world in which they lived and moved and from which they drew their means of living.

Too long had they pursued form for form's sake, too long had designers bowed down to the dictates of ephemeral and transient fashion, the result being that building had lost its grip on the majority of the audience. There was something deeper to be striven for than mere decoration; it was concerned with the instinct of man to touch upon the mysterious and the spiritual. If they looked around at recent buildings, the manifold evils of the pursuit of form irrespective of cool calculation of the exercise of the reasoning faculties were clear to the view. The attributes of present building appeared to be surface show, and inside confusion. There was no joy in such works, no spiritual expression, no exultation over structural victories, no attempt to make use of the latent forces inherent in upstanding materials. The stonework was laid with precision, the bricks were sound, the carving and ornament applied regardless of expense, but it was apparent that the men employed on the work had imbibed the listlessness of the paper creation from the architect's board. It is all very clever and touching, but it was not convincing. Neither designers nor artificers had succeeded in conveying a message.

Discussion.

Mr. Robert Atkinson, Mr. H. S. Goodhart-Rendel, Mr. K. N. B. Cross, Mr. Manning Robertson, Mr. H. M. Robertson, and Mr. W. J. Benslyn took part in a discussion which followed the paper, and a hearty vote of thanks was accorded to Professor Richardson.

ILLUSTRATIONS.

Cambridge University: School of Bio-Chemistry.

We give this week further illustrations of the School of Bio-Chemistry, Cambridge University, of which Sir Edwin Cooper, F.R.I.B.A., is the architect. Other illustrations of this building were given in our last issue.

The woodcarving shown in some of the illustrations was executed by Mr. George Houghton.

Municipal Auditorium, Colorado Springs, U.S.A.

This building is primarily meant for the holding of conventions, the arena and balcony portion being for the large, and the three side halls for the small, conventions. In addition, it will serve for public meetings, orchestral concerts, and musical recitals. Space is provided on each side of the proscenium arch for an organ, and the arch is treated with perforated work for the emission of the sound. Chair storage is provided, so that the arena can be cleared for basket-ball games and exhibitions of various kinds.

The total seating capacity is 2,920; and the side halls seat 305, 255 and 90 respectively. The construction is fireproof throughout. The exterior walls are faced with light grey brick, and the stonework is of light buff Boise sandstone. A complete fan system of heating and ventilation has been installed, the fans being placed on the upper floor at each side of stage. In the ceiling of the arena has been installed acoustical felt, and the results are unusually successful. The cost of the building was £67,200; and it was completed in June, 1923.

The design and supervision of construction were by Messrs. T. MacLaren & T. D. Hetherington, and the working plans were made by Mr. C. E. Thomas.

No. 29, Weymouth-street, London, W.1.

This house, which was designed in 1914, but which, like other work on the Howard de Walden Estate, was held up owing to the war, is being built for Sir Walter Lawrence, J.P. The building is fronted with Portland stone, and the illustration was exhibited recently at the Royal Academy. In execution one of the bay-windows has been omitted in order to allow of one larger bay being constructed.

The architect is Mr. George Hornblower, F.R.I.B.A.

Barry Club.

The sketch design on p. 113 was presented to the Club by a member of the Committee, to enable it to see the accommodation that can be put on to the site of the present premises of the Club, and the site of the adjoining premises, which will be acquired. The gymnasium on ground floor will be used as a hall for lectures and entertainments. The basement has a dark room and skittle alley. The first floor has games rooms, and billiard room (over the gymnasium), which contains six tables. The second floor contains the caretakers' quarters. The building will be erected when funds permit. The design is by Mr. J. A. Hallam, M.T.P.I., Deputy Architect of the Welsh Town-Planning and Housing Trust, Cardiff.

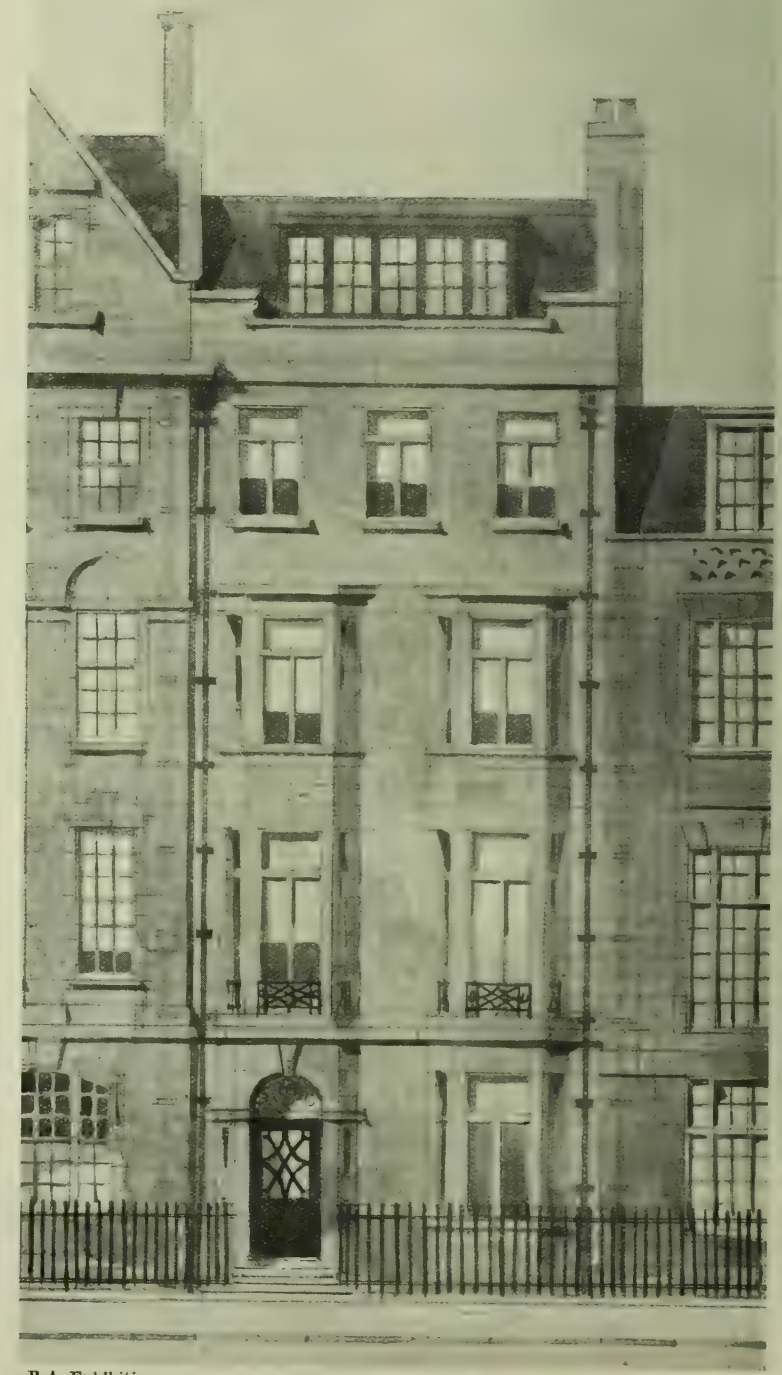
MEETINGS.

MONDAY, *January* 21.

Royal Institute of British Architects.—Mr. P. E. Nobbs on "Architecture in Canada." At Burlington House, Piccadilly, W. 1.

WEDNESDAY, *January* 23.

L.C.C. Central School of Arts and Crafts.—Sir Banister Fletcher on "Ancient Rome." At Southampton-row, W.C. 1. 6 p.m.

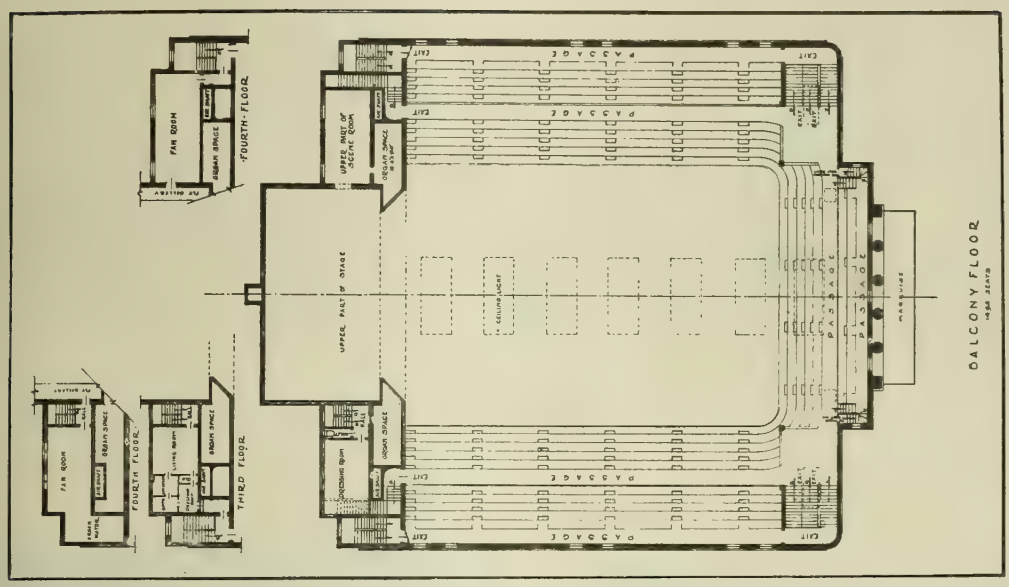


THURSDAY, *January* 24.

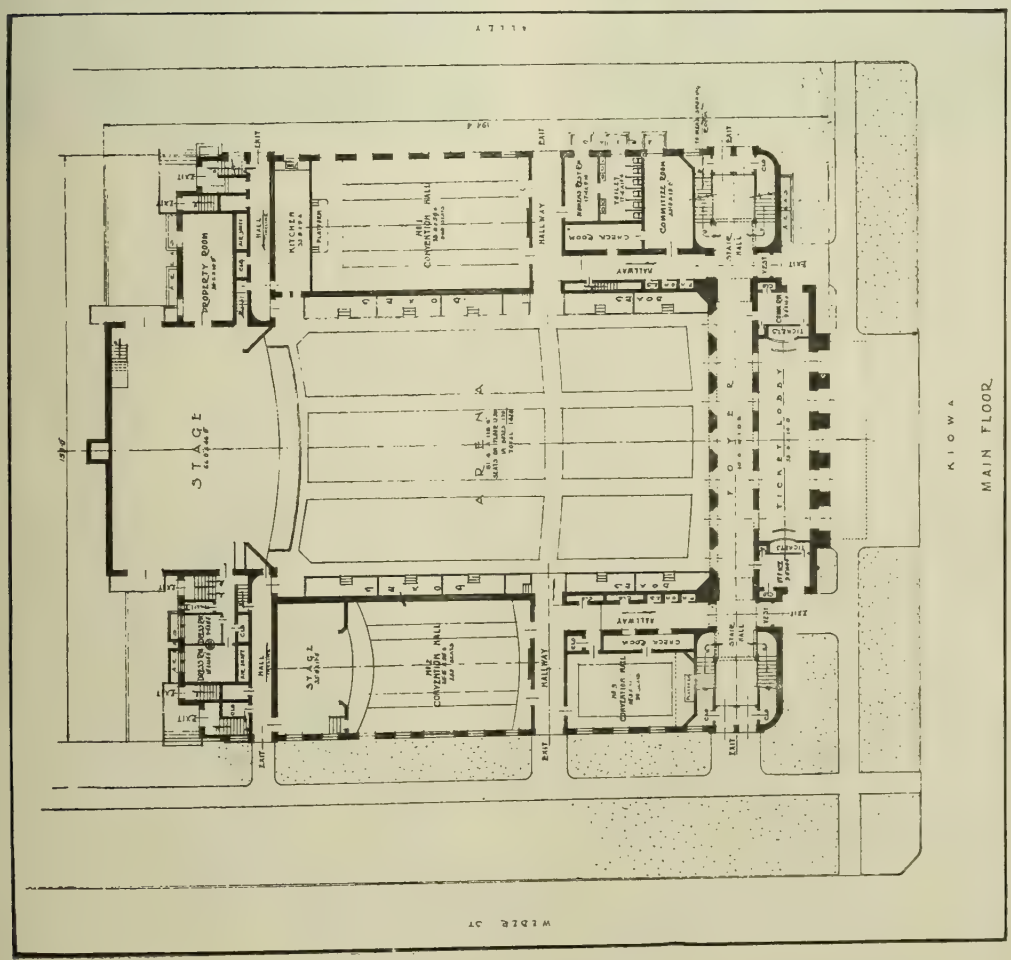
Society of Antiquaries.—Mr. R. A. Smith on "Examples of Anglian Art." At Burlington House, Piccadilly, W. 1.

Architects' and Surveyors' Assistants' Professional Union.—Annual General Meeting of the Metropolitan Branch. At Caxton Hall, S.W. 1. 7 p.m.

Institution of Structural Engineers.—Presidential Address by Major J. Petrie. At 296, Vauxhall Bridge-road, S.W. 1. 8 p.m.



Leeds and West Yorkshire Architectural Society.—Annual Dinner.



R.A. Exhibition.

ST. PAUL'S CATHEDRAL.

PROBLEMS OF REPAIR.

FOR several years past the structural condition of St. Paul's Cathedral has been the subject of inquiries undertaken by the Surveyor to the Fabric—Mr. Mervyn Macartney—and latterly by a Commission of architects and engineers appointed by the Dean and Chapter to advise with him upon the best methods of repair. From time to time a certain amount of information is published in connection with appeals for funds for the maintenance of the building, but the full report of the Commission is still a matter for the future to reveal. In the meantime, and in preparation to receive their report with intelligent appreciation, it is well to examine the broader aspects of the difficult problem the conservators have before them. St. Paul's Cathedral is the record of a life's development as well as a life's work.

Sir Christopher Wren at the end of a long life, his mind stored with the accumulated experience of a thousand experiments in building science, stands for all time pre-eminent as the inventor of sound structural expedients. What the great Brunelleschi had done with an extraordinary complexity of ribs and panels—still incomprehensible to most observers—Wren achieved by means so direct as almost to disguise with their very simplicity the wit that created them.

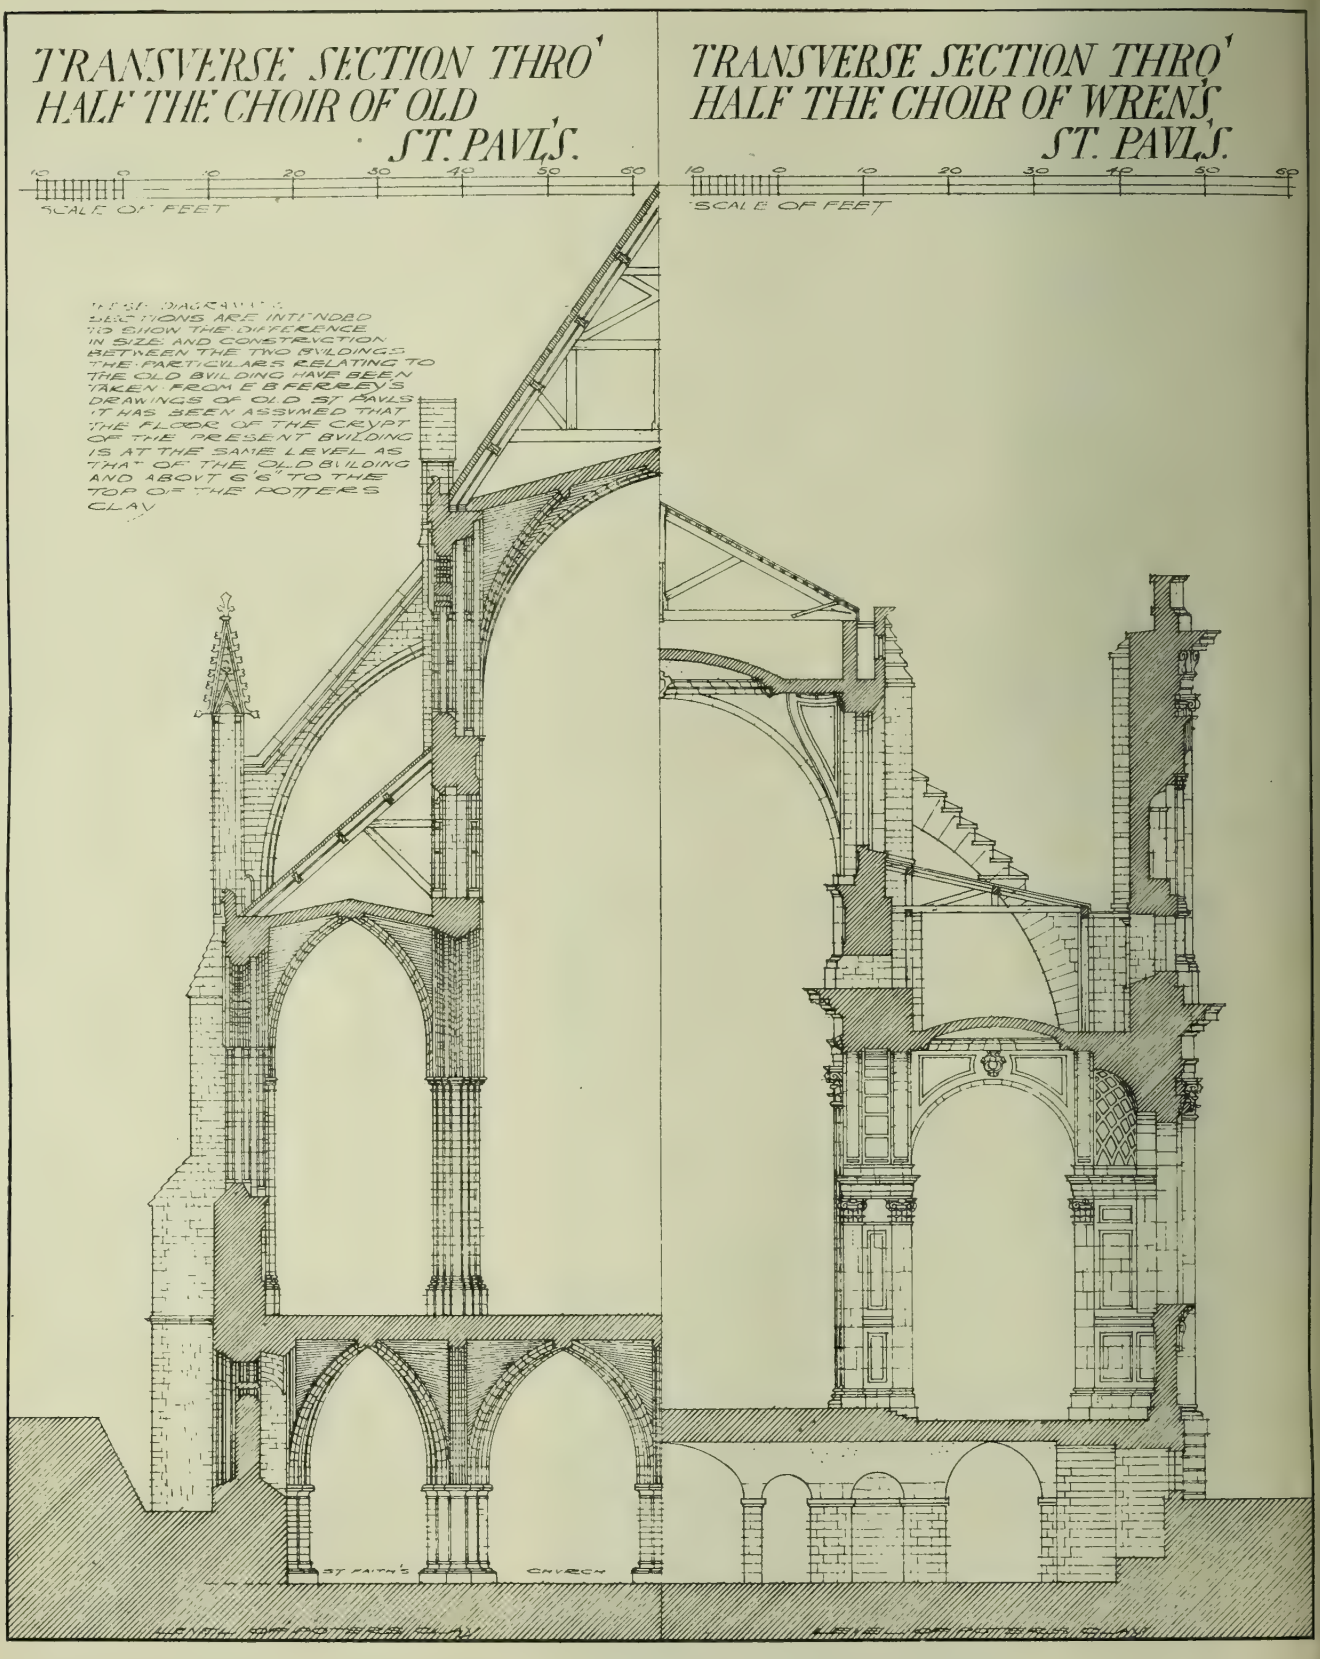
Compared with the lightness and buoyancy of Wren's design the work of Bramante and Michelangelo at St. Peter's looks heavy and inarticulate, and it seems extraordinary that Wren, this man of infinite capacities, should have been guilty of obvious faults; this mathematician be out in his calculations, this antiquarian commit the structural blunders that the ancients, whose records he studied, had succeeded in recognising and finding means to avoid.

But Wren, a young man already famous at thirty-four years of age as a theoretical and experimental scientist, was not yet a practical builder, nor can he have been well acquainted with the hundred and one difficulties of builder's work which may be solved in the light of experience or which determine themselves without any exact solution by the unconscious processes of established routine.

Wren's friends forced him to turn his attention to building, and building on the greatest scale yet seen in England at a time when his experience in this special class of work was practically nil. Nor was the time altogether favourable to a young man about to study the problems of practical construction. Church building on a large scale was a thing of the past, the Gothic manner of constructional architecture discredited, and the information concerning the fashionable architecture in process of introduction from Italy concerned itself, as Wren himself has left on record, rather with the proportions of orders and mouldings than with the abutment of arches. Science, in its infancy, was with difficulty struggling out of its swaddling clothes of superstition; astrology, and magic art and conditions were such as threatened to breed disaster rather than success. What might have been called a young man's rash presumption in undertaking to build a gigantic Cathedral with less practical experience than would be needed to encourage most of us to venture upon the erection of a humble cottage has been shown by the success of the experiment to have been not rashness, but wise confidence in his own resources. Wren's work at St. Paul's is none the less an experiment in the self-expression of an architectural giant and bears the impress of its experimental character in all its parts.

Throughout the great work Wren continually found himself called upon to take risks and adjust the conflicting claims of the ideal and the actual. His favourite design, admirable in its structural congruity, he was forced to abandon, and in regard to the expedients of building construction to be employed in commencing work upon the approved design, he seems to have consented at first to the use of the normal methods of his time without designing improvements of his own, though exercising surprisingly mature discretion and common sense. It was in the higher parts of the building that he exploited his own constructive skill, his inventive powers increasing with his difficulties. His estimate of the bearing capacities of the pot earth foundation now seems to have been slightly at fault. He was optimistic, and existing evidence of sliding and sinking on the foundations must be taken into account by the conservators, as well as the possibility of future movements resulting from the same cause and from the aggravation of it by the demands of modern life, such as the drainage of the subsoil for the formation of deep basements, sewers and underground railways, and the vibration caused by heavy traffic. Had Wren commenced the foundations after the full attainment of his great knowledge he might perhaps have exercised more caution, but in that case his Cathedral might never have been built.

The cost of taking down the foundations to a sure depth would have been enormous both in time and money, and patronage might have been frightened at the prospect. It will be interesting to learn by what method it is proposed to restrain the slight though general movement of the building to the south-west and the particular subsidence of one of its eight central piers towards the north-east. Another main defect which will demand careful attention is the inward lean and bulge of the eight central piers overloaded and eccentrically loaded by the weight of the drums and their load of cone and inner and outer domes. Examination reveals the fact that the substance of these piers has been racked apart in long, slanting lines by fractures extending from points near their inner edges at their tops to points near their outer edges at their bases. Stresses are so great as to make repair both hazardous and difficult, for, in removing any stone, however defective and useless it may appear to be, a risk is incurred that adjoining stones, hitherto sound, will be split by the transference to them of more pressure than they can safely bear.



A sound method of repair will involve the provision of a substantial and convenient temporary staging to support the great weights, and a well-devised scheme by which the weakened piers can be made strong once more. The composite nature of the piers with an internal core of rubble enclosed in a skin of ashlar of varying and uncertain thickness, the whole shattered by the eccentric load, presents a special problem, and the part of the Commission's report dealing with it should provide an intellectual treat to all acquainted with the difficulties of the case. A brilliant solution is demanded, for nothing short of the highest efficiency will suffice to preserve the building or avoid grave danger to those concerned in the operations of repair.

The dislocation in surrounding parts of the building consequent upon the subsidence of the central piers raises an artistic as well as a constructional question. It is extremely improbable that any proposal to jack up the arches and the domes to their original level will be made or put into effect and, failing some such process, the lines of moulding and cornice will continue to dip more or less abruptly at the points where the lightly loaded portions of the building abut upon the central and heavily loaded parts. A certain amount of movement will continue in this zone whatever measures are adopted, and spalls of stone are liable to fall from time to time when heavily loaded masses tear free from lighter masses, or grind past them in further unequal settlements.

Suggestions have been made in the past for spreading the central load upon a broader basis either over the outer parts of the eight piers or by a still more extended scheme over the surrounding piers and bastions. The presence or absence of any such proposals in the Commission's Report and the technical details of

First Draft for an Explanatory Diagram Showing Component Parts of the Cathedral.

Diagrammatic Section through the Choir of Old and New St. Paul's,

From a drawing by MR. W. G. ALLEN.

One of the Southern Group of Buttresses.

any proposed treatment in connection with the zones of unequal settlement will be scrutinised with interest. The extension of the same series of fractures due to the parting company of heavily loaded and lightly loaded portions of the building also affects the upper portions of the drum and its surrounding external peristyle. These defects may be treated either with piecemeal repairs, such as replacing of fractured stones with sound new bonders, or by this process combined with some uniting framework which it may be thought advisable to introduce. Above the level of the white stone gallery the building is still large in scale, but the pressures more nearly conform to the limits covered by the ordinary experience of a building surveyor in active practice. The individual decay of materials under stress of weather and the attacks of anobiid beetles in the timbers of the outer dome have to be guarded against or made good. Even in the higher portions of the building the evidences of unequal settlement are to be seen, but they are slight in comparison with the serious defects below. The fragile nature of the stonework in the lantern exposed to violent winds at an exceptional height demands constant watching and periodical small repairs rather than any particularly drastic treatment.

The comparatively low outer walls of the building have in many places been pushed out by the thrust of its vaults, and are affected to some extent by subsidence and sliding on the foundations, these defects being easily apparent in the transepts and at the west portico and towers. Opinions will be divided as to whether these outward moving parts should be anchored to the inward sinking central group of eight piers by a light framework possessed of great tensile strength in an attempt to neutralise the opposite forces, or whether the high and heavy central part should be treated as an independent building—as its fractures have shown it to have accidentally become. This latter course would leave the low surrounding building to be dealt with by an entirely separate scheme of chainages by which movements of northern parts to the north may be harnessed to southern parts moving south, and so forth.

Several years ago tie-bars were made use of in the case of the south transept to tie in its outward leaning gable back into the body of the work. No ill results seem to have been precipitated by this use of ferrous metal, although in places the tie-bars are exposed to air in the loft of the transept roof. A consistent development of the same idea expressed in reinforced concrete might prove serviceable in avoiding or restraining in the future the outward movements in the side walls and towers.

One curious problem of repair is presented by the range of buttresses (see illustration) which project from the outer drum of the dome and spread some part of its weight and the wind pressures received by the upper part of the building upon the eight central piers and the four great arches and four semi-domes which span the spaces between them. All these buttresses have failed, more or less, and some of them are shattered from top to bottom by fractures practically parallel to the direction of their sloping outer edges. What view the conservators will take of these buttresses and their importance, whether they will be content to leave them fractured, to repair them with sound masonry, or to augment them by a scheme of reinforcement that might enable them more efficiently to function, remains to be seen.

In the meantime the Commission is going the right way to work and has very wisely spent a considerable amount of time in finding its way about the building, in surveying its deviations from the level and from the vertical and examining such details of its structure as can safely be made accessible for inspection. In such a complex building, where it is difficult even to know the exact position and orientation of certain details in the darkness of the lofts, some patience must be expended in these preliminaries.

To facilitate mental grasp of the subject a large isometric drawing is being prepared to show the co-ordination of the several parts of the building, especially in relation to its central mass. The first draft of this important drawing is here published, not so much for the artistic value of the sketch, but as an aid to the comprehension of what is in reality one of the most constructionally interesting buildings of all time.

A diagram published on page 110 shows the comparative sections of the choirs of Old and New St. Paul's, and throws into conspicuous emphasis the solid character of what may be called the lower parts of Wren's building.

Wren has left it on record that he made it a point to design for a long unbroken vista from end to end and from side to side of the church, and that he particularly wished to avoid the diminution of the main spans by the introduction of bulky piers at the crossing. These, as has been mentioned above, he kept so light as to give rise to a special problem in repair. To further the same artistic scheme, the piers of nave and choir were given greater sectional area than was absolutely necessary to support the comparatively light loads they are called upon to bear.

The much-debated screen wall above the exterior wall for the aisle of Wren's cathedral is prominently marked in the diagram. This upper portion of the wall has sometimes been compared to a Gothic pinnacle, and undoubtedly it acts as top-weight to modify the direction of the thrusts of aisle vault and flying buttress. It would have been placed to greater structural advantage on the inner rather than the outer face of the wall, but questions of stylistic propriety were allowed to take precedence over constructional fitness to this extent. The posing of an eccentric load upon the outer side of a wall which might be expected to rotate upon its base and move outwards under the pressure of two superimposed arches is not by any means ideal, and a detailed analysis of the pressures and resistances would seem to be necessary before it can be determined whether the top-weight, as applied at present, is useful or otherwise. The continuity of the wall from end to end of choir or nave probably helps considerably and brings in a factor not indicated in the section.

Attention has been concentrated upon the damaging effects of eccentric loads of late years by the use of steelwork under such conditions of financial stringency as to demand minute research into the strength of the material under differing conditions of loading.

It would be as absurd as it would be grossly unfair to expect from Sir Christopher Wren the best knowledge of our time on the subject, but the lack of it lies at the root of some of the principal defects in St. Paul's Cathedral.

The Study of the Past.

On January 8 Professor Theodore Fyfe lectured to the Liverpool Architectural Society on this subject. In the course of his remarks he said that they were trustees for posterity and should have constant regard to the fact that it was easy to destroy and impossible to replace. Architectural students, he said, would approach the study of the present with a certain amount of prejudice, but the greatest architecture of the past offered the desirable atmosphere of calm. Local museums of art should be encouraged liberally and English history in the schools ought to embrace the history of the arts and crafts. To this end, more local energy and enthusiasm were demanded. Students should receive training in the whole history of art on the broadest possible lines. Only when students were taught both to draw and to see would the modern methods of education get their chance to succeed fully. In conclusion, he suggested the constitution of an international committee to form central bureaux for comprehensive information about architecture, and to compile and publish an international catalogue.

The President (Mr. W. Glen Dobie) thanked the lecturer for a paper packed with thought and stimulating suggestions, and he was advised to further the establishment of a school of mediæval architecture. In reply, the lecturer said his students studied that form of architecture of their own free will.

THE LAW RELATING TO BUILDING.

By W. T. CRESWELL, LIC.R.I.B.A.; F.R.S.I. (*Barrister-at-Law*).

II.—AGENCY.

The Position of the Architect or Surveyor.

We have seen in the previous article that the position of the Architect or Surveyor, when superintending works for an employer or building owner under a building contract is that of agent. The majority of legal problems and complications, in business relations, between persons of every description, are settled by the law of agency. Disputes arise usually upon some question of simple contract, *e.g.*, (1) whether any contract exists; (2) whether there has been a breach of the provisions of such contract; (3) what remedy or legal rights the parties have. If an architect is employed to prepare a plan, or a surveyor to measure a piece of land or prepare a bill of quantities, and he performs the work as one holding himself out to have "reasonable care and skill" for such work, then he is entitled to be paid the stipulated (or a reasonable) remuneration for such work; and, when paid, his contract with the employer is at an end. The employer may decide not to use the plan, but is bound nevertheless to pay for it. Such simple transactions are rare.

Relationships with Third Parties.

In general a contract includes supervision of the work whilst in progress, granting of certificates for payment on account, and final settlement of accounts; and these bring the agent into certain relationship with third parties. It is this relationship which we have to consider, as it frequently gives rise to difficulties. Under a building contract, the architect or surveyor, in the interests of the work, is invested with certain special judicial or arbitration powers, anticipatory of possible disagreement. Let us review how an architect or surveyor may enter such employment or agency. Generally, when employed by a private individual no particular formality is customary. The custom is for the employer to interview the architect or surveyor, and make known to him his requirements. Though the latter would be well advised to obtain written instructions, or subsequent confirmation of what was agreed upon at the interview, before proceeding with any of the work, generally, he does nothing more than enter the facts in his diary. Without written evidence, it is difficult to prove any contract should the employer for any reason repudiate the verbal agreement.

Contracts in Writing.

Stress is laid on the fact, that to be binding, certain contracts must be in writing, and the knowledge of these as distinct from the above, is important to the architect or surveyor, to protect his own interests. A verbal agreement between the parties for work to be completed by all the parties to the agreement within a year, if it can be proved, is a binding contract. But anent a contract not to be completely performed by both sides within the year, the fourth section of the Statute of Frauds provides that "no action shall be brought . . . upon any agreement which is not to be performed within the space of one year from the making thereof unless the agreement upon which such action shall be brought or some memorandum or note thereof shall be in writing and signed by the party to be charged therewith or some other person thereunto by him lawfully authorised." Suppose, therefore, one party does all he has contracted to do inside the year, or, again, that by any possibility the other party could have fulfilled his undertakings within the year, then the statute does not apply and the contract need not be in writing. But if, on the other hand, the year is exceeded by a day, the contract must be in writing and duly signed, &c. In short, if the intention is that the contract shall be completed on both sides within the year, no writing is required; also, too, when the contract is to be entirely executed by one party within the year, no writing is required. (See Donellan *v.* Read (1832) 3 B. and Ad. 899.) In Hanan *v* Ehrlich (1912 A.C. 39) the House of Lords determined that where there is no mention of time, and the time is uncertain, the agreement is not within the statute; but, if a time longer than a year is mentioned, though there be a power to determine within the year, the agreement is within the statute and requires writing. In the event of litigation the contract, to be enforced, need only have been signed by the party to be charged. It must contain the names or a sufficient description of all parties, the subject matter of the agreement, and the consideration to be paid for the work to be done. It need not be one document, it may be more; but, if so, the papers placed together must include the essentials. Further, in any negotiations with corporations, it is necessary that the contract should specify the period of employment for each particular undertaking; and, in any case, all contracts with corporations (not being companies under the Companies Act, 1908), even those for work to be completed in less than a year, must be under seal of the corporation.

It behoves the architect or surveyor not to rely on a memorandum; indeed, any writing merely signed by an official of the corporation. Under Section 174 (1) of The Public Health Act, 1875, "every contract made by an urban authority whereof the value or amount exceeds fifty pounds shall be in writing and sealed with the common seal of such authority." Numerous actions have been lost where the plaintiff has relied on an unsealed contract made under the Public Health Act with an urban district council for work over fifty pounds; even though the authority has received the benefit of the work. Quite recently (October 15, 1923) such an action was lost by a quantity surveyor in the King's Bench Division. In Nixon *v.* Erith Urban District Council, plaintiff sued the Urban District Council for £1,150 for work done at the defendants' request in connection with a housing scheme. The contract was not sealed, and the court held that the plaintiff could not recover any fees.

It should be noted that the above quoted section applies only to contracts by urban authorities. Contracts with rural district councils are regulated by the ordinary law relating to corporate bodies, and, with few exceptions, must be made in writing under seal.

The Contract is "Personal."

The contract between an employer and an architect or surveyor is a "personal" contract, *i.e.*, the architect or surveyor undertakes to superintend the work himself. He cannot depute his duties, and it follows that in the event of his death the contract automatically terminates. In fact, his executors, &c., cannot even claim payment for work done up to the time of his death, excepting as the contract may have provided for payment of fees by instalments, when only those instalments already fully due may be claimed. In the event of the death of the employer, however, the employer' responsibilities devolve on his executors, &c., unless (and it is very rare) the contract provides against this. In the interests of everybody concerned the contract does usually provide that the executors, &c., shall complete the contract. In the event of the architect's or surveyor's services being retained at a salary, his executors would be able to render salary *pro rata* due to the day of his death. (See Stubbs *v.* The Holyhead Railway Co. 1867, L.R. 2 Ex. 311.)

Expert Evidence.

Architects and surveyors when employed to give expert evidence before Parliamentary Committees or the like, or in law courts, or at enquiries, arbitrations, &c., are allowed (as all other experts witnesses) peculiar privileges, *e.g.*, to refresh their memories by reference to their reports, accredited works, &c., on their special calling or topic, to quote cases or judgments in support of their evidence, also similar and accepted evidence given by them before in other cases, and to be paid fees commensurate with their standing and reputation.

HAMPTON COURT.*

Englishmen have a characteristic tendency to belittle the things of their own land, and it may come as a surprise to many of Mr. Law's readers to find Cardinal Wolsey placed among the great men of his time and in the first rank of the princes of the Renaissance. In a critical age names count for much, and Wolsey's position as a patron of the arts lacks just that dignity that is accorded to those who found employment for men who have since become famous as the master craftsmen of the period.

If only it could be discovered that Wolsey had persuaded Raphael or Michelangelo to work for him no more need be said; the critic who can afford to despise the work of an unknown native artist would immediately recognise the supreme value of that of the famous foreigner. As it is, some of the original decorations of Wolsey's palace at Hampton Court are the work of Italians attracted to England by his liberal patronage of the arts: the Arms of Cardinal Wolsey and certain roundels in terra-cotta including one with a head of Julius Cæsar, illustrated in the book, being the work of Joannes Majano. But whatever shortcomings may be attributed to Wolsey as an art patron, in accepting a lesser known craftsman in place of the great masters already overtasked with a multitude of commissions at Florence or Rome, the versatile spirit of the Cardinal statesman, whether measured by the magnificence of his buildings, his regal hospitalities and costly plate, or by his scholarly and statesmanlike qualities, can only be compared with the most famous rulers of his time.

In both Wolsey's sewerage works and pure water supply, with lead pipes passing under the Thames from Coombe Springs three and a half miles away, the attainments of sanitary science reach a level not usually credited to the Tudor period.

Mr. Law is prepared to see in the extraordinary pomp affected by Wolsey in all his affairs a regard for the good of the State which, the Cardinal evidently felt, could best be built up by an outward assumption of importance. This theory is borne out by a conversation between Wolsey and Dr. Barnes, "one of the new puritanic sect," in which Wolsey defends the extravagant show of his triumphant processions where crosses, pillars and pole-axes of silver were borne by attendants before him. The unpleasant reverse side to all this glory, instrumental as it may have been in lifting England to the place of a first-class power, was, if Shakespeare may be believed, nothing short of extortion ruthlessly applied.

Envy of the Cardinal's greatness found more than a colour of excuse in the contrast between the ideal character of a churchman and his actual behaviour as a statesman regulating all affairs by considerations of policy, and the profane subjects of some of his decorative tapestries were commented upon in a contemporary satire quoted in the book. Mr. Law's account is particularly opportune since it is published at a time when three rooms at Hampton Court Palace, formerly included in the residential portion of the building, have been thrown open to public inspection. These rooms have been identified as Wolsey's own private suite and retain a considerable amount of their original oak panelling and ceiling decoration, stone and brick fireplaces and mullioned windows. The illustrations include some very charming sketches in line, where the brick and mortar architecture is faithfully rendered, as well as some photographs of the newly-opened rooms.

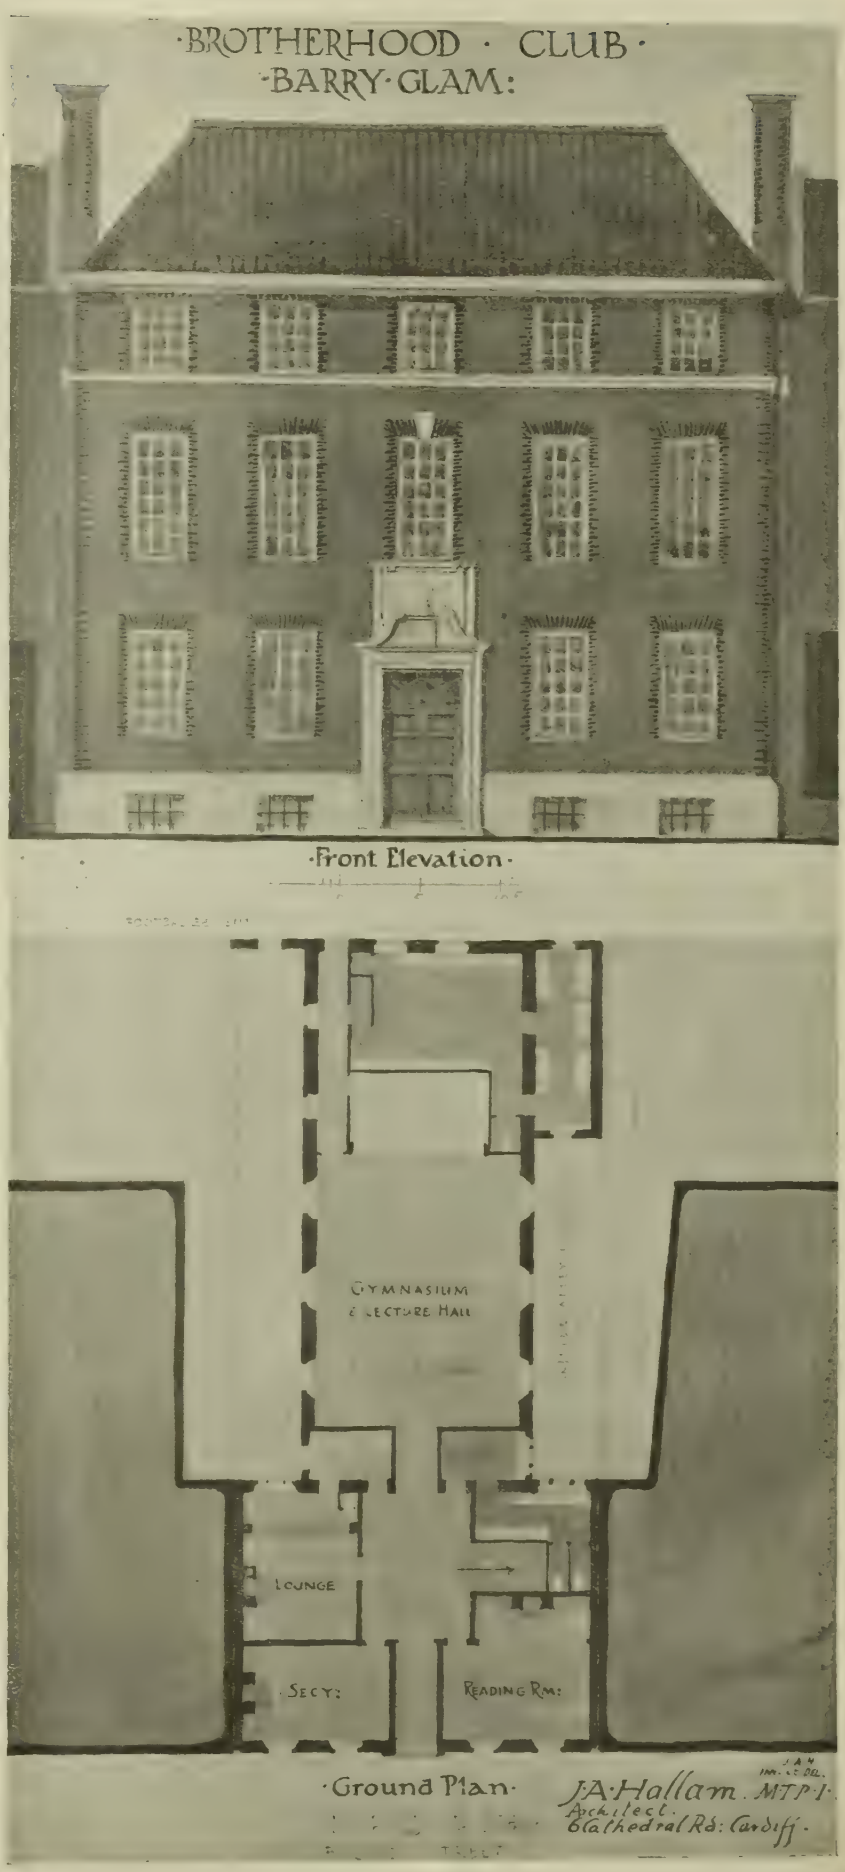
EXHIBITION NOTES



LEICESTER GALLERIES.

The water colours and paintings of Venice by Alfred Hayward, at the Leicester Galleries, will appeal to many for their delicacy of treatment; there is none of the *bravura* which many have essayed in treating of it, but the artist makes a distinctive choice of subjects and treats them with much refinement and good atmospheric effect: he certainly brings an artistic vision to play.

THE PASTEL SOCIETY.

Bearing in mind its possibilities, we always look forward to the exhibition of pastel drawings at the annual show of the Pastel Society with a certain degree of pleasurable anticipation. The present exhibition is well hung and has an attractive appearance in the pleasant galleries of the Institute. There are some undoubtedly able drawings to be seen, possibly more than usual, but there is still too much of mere pretty picture making, which might have been done, and perhaps better done, in other media.

Prominently displayed are three admirable drawings by Isaac Cohen. In the delightful portrait of Mrs. Edward McCormick (290) we see pastel at its best, for it shows the medium in its real value and colour, light, tone and drawing are skilfully combined. The "Blue Winch Ball" (289) is also admirable, and the "model posing" is a refined and charming sketch. The same artist has three other good exhibits. This central group is flanked by four pictures by Leonard Richmond, which indicate progressive attainment in the work of this brilliant pastellist. In a more subdued key than is usual to this gifted artist is the "Sand-dunes and Trees" (294), which is a restful and beautiful little landscape. More in his old manner is 287, which is full of a subtle cleverness. In the "Glow of Sunshine on the Sea" the artist has in some ways excelled himself, for he has obtained a breadth of softness which his skill often denies him. A very clever little drawing of St. Mark's, Venice (285), by Hedley Fitton, does not strike one as essentially pastellistic, whereas in the "Weigh-House "(284) J. B. Harrison uses the medium skilfully in a low tone of colour which is very pleasing. His "Old Harbour" has a telling charm of mystery. Mr. J. Littlejohns has a group of very clever drawings, amongst which Nos. 276 and 272 have a real touch of ideality. William Redworth, as usual, makes an interesting show of four drawings. Henry Butler's "Low Tide" (247), and his charming subject "Evening on the Hills," rank amongst the best. The former drawing has a freshness of treatment which is very effective. The "Old Mill on the Marsh," by T. W. Hammond (238), is an able drawing: it might well deceive one as to its medium. Miss M. G. W. Wilson comes to us in new guise with her "Casa Frollo, Venice" (231). This attractive picture of white colours and purple bloom does not recall her vigorous war pictures. Terrick Williams has a group of six clever drawings; the "Boats, St. Ives" is most like himself and very daintily expressed. "The Sandpit at Bramford" (190) is a fine broad vision by Leonard R. Squirrell. H. Davis Richter's "The Hillside" (205) is a super-brilliant expression of flowers. The portrait of E. J. Sullivan (123), by Mrs. F. Humphrey, is a masterly study. The snow scenes by Lawrence Ginnell (141 and 137) are noticeably good. Hanslip Fletcher has some interesting pencil sketches of Paris. Another very able portrait is the charcoal sketch of the Prime Minister (164) by R. G. Eves. There are shown three good pencil sketches of old architecture by Francis W. Bedford. The pen and pencil part of the exhibition is small, considering what excellent work in these mediums is being done to-day. We have not exhausted the list of what might well be praised, but on completing our round of the galleries we are inclined to think this is one of the best shows the Pastel Society has made.

Barry Brotherhood Club. MR. J. A. HALLAM, Architect. (*See p.* 106.)

SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS.

On January 10 Captain L. M. Gotch, F.R.I.B.A., lectured to this Society on "The Charm of the English Village." Mr. J. R. Wigfull, the President, was in the chair. In the course of his remarks the lecturer said his greatest difficulty in preparing the lecture had been to choose his illustrations from out of the overwhelming wealth of examples, and they must forgive him if he had had recourse to his native county more frequently than to others, for two somewhat cogent reasons: First, because he knew it best, and second because it contained some of the finest examples of the features of the village about which he wished to talk for a little time.

Villages were rarely found in England on the hills or upland country, and when they did occur they were generally hidden away in narrow valleys down which ran a babbling brook. A certain village in Derbyshire was said to have the highest altitude of any in England, and a bleak, barren place it was. The reason lay in the origin of the village, which was primarily to give shelter to man and beast, and though the history of the village was not part of his subject a very brief outline of its origin would add to its interest.

In general terms the village of to-day (not the small industrial mining village) might be classified as follows:—(1) The farm village; (2) the feudal village; (3) the industrial village.

The first was a gradual growth round one or more farms, and could usually be recognised by the number rather than the size of the barns and farm buildings, and was the oldest type of village, and was to be found nestling at the foot of the downs of Yorkshire moors and the Cotswolds.

The second was the overflow of the retainers of a landowner who, when times became more peaceful, built permanent houses under the shadow of the castle or hall, and dated chiefly from the twelfth and thirteenth centuries; whilst a fourth type was the ecclesiastical, and was the result of the numerous ecclesiastical communities, and accounted for many instances of small villages with fine churches often much too large for the population.

The third type consisted of those which originated in the housing of men employed in developing the natural resources of the country, such as stone and slate quarrying (Weldon), mining, brickmaking, timber felling, milling, brewing, etc.

All four were inevitably agricultural, and in addition there were innumerable hamlets or clusters of cottages which were usually purely agricultural.

The latter were often very picturesquely situated, and occasionally contained some feature of real interest, but they invariably lacked the dominant feature of a village—the parish church. Whether viewed from afar, when its tower or spire was a landmark for several miles around, or first glimpsed round a bend in the road, or found tucked away amongst a protecting cluster of cottages and trees, the church was to a village what a mother was to her children. And from it, in truth, much of the village history might be culled, provided it was built of stone. And why only if built of stone? Because timber churches, being subject to fire, had almost all been destroyed, and the oldest one existing was Margaretting, in Essex, which was not more than 350 or 400 years old. Also brick as a building material in England was not in use from the Roman times until well into the fifteenth century, and then was frequently covered with plaster, and thus its value archæologically was largely destroyed. Those of them who lived in a stone district had perhaps rarely seen an ancient timber or brick church, and yet he assured them that they could walk, cycle, or motor from London to Hull and see no more than a dozen stone churches, if as many.

They would think that he had forgotten that he was lecturing on the village, and that he was giving them a dissertation on the church, but it was the centre of interest, and he could not leave it without a word as to the three functions for which it was used for most of them in the course of their brief spell of existence, namely, baptisms, marriages, and burials.

If they looked into the churchyard they would find much to interest them in the inscriptions on the headstones of the graves which filled "God's acre." If a slight shower drove them for shelter to the lych gate they might look back at the church and notice the water running off the tower and chancel roof, pouring out of the mouth of a bishop or devil or some local celebrity perpetuated in stone by the humour of the mason. After the rain had ceased they might look along the village street. They all knew such streets, superficially, as he did, but possibly had not studied their character. Like many human beings they improved on closer acquaintance. They had not the fine clothing or magnificence of their city fellows, but they had frequently more definite personality. The houses in them often had wonderful chimneys like the stack at Newport, such as were to be found throughout East Anglia, whilst the stone district of the Cotswolds and Northamptonshire had their own types.

The great forests of olden times provided cheap building material such as they had at Wigmore, in Worcestershire, tarred to make it more weather-proof, and close enough together to fill in between with wattles and plaster. In the county of Northants there were over 100 villages with scenes possibly not all so picturesque as Devon, but with more objects of definite architectural interest, and this was due to their being in stone and having been preserved, and if they asked the father of the village as to the chief objects of interest, he would tell them to go and see the following items of interest. Village prisons were rare to find, but the "Ound" at Weldon had been used within his memory for the imprisonment of malefactors—for a short time only—and a dull dark place it must have been to spend a night in; but better than the stocks or pillory where one was left to the mercy of the populace who, should the unfortunate prisoner be unpopular, were wont to give him or her a most uncomfortable time. The whipping post needed no comment. The ducking stool was quite an ingenious contrivance; and used in moderation must have afforded much amusement to the onlookers, and would not seriously harm the occupant.

Village shops were once quite a feature of interest. The butcher's shop with its half-door, and wood shutter for window was a typical example of the shop to be found in any village. But one of the oldest trades, and that immortalised by Longfellow, was that of the blacksmith, and a village forge was surely one of the most picturesque sights in all England.

Interesting, too, were the institutions found tucked away down side lanes in many of their villages—those delightful houses of rest for the aged and infirm. Sometimes, and let them hope most frequently, they were built and endowed from beneficent motives, but frequently from munificent, or for love of ostentation; they varied from humble, but homely, dwellings to a building with the founder's coat of arms shouting to all who passed the glory of his gift. Hospitals, not run by voluntary subscriptions, but by the church or its supporters, were found usually in its shadow or adjoining the churchyard. They were more for chronic cases than casual or emergency cases, but those that remained were charming relics of a bygone institution.

The demands of the Board of Education had caused the demolition of many old schools, but there remained a number in our villages such as those at Grassington in Yorkshire. He was purposely taking simple examples and could tell them of finer buildings architecturally, but they should learn to look for what might be found of interest in any village and not in just a few special localities; and they would find in many of the villages of England the old manor house with gables and mullioned windows, chimneys, and dormers.

Mills were essential in old days for every village to grind the local crops, transport being a difficulty; but now they were less and less used, and often the wheels or the sails were idle. A fascinating thing was the windmill with the graceful movement of its sails, and the well proportioned and picturesque mill was found still in Norfolk and Lincolnshire, but rarely in other parts of England. It always appeared to him as mysterious, and he could easily associate it with some foul deed, or picture the villain tying the heroine to one of the sails and then, having loosened the brake, leaving her to her fate.

In conclusion, it was tradition and time that gave charm to buildings and communities, but there was one outstanding feature to be found in every village which one could not leave without seeing. It had many forms and might be only a little tablet on the wall, or a crucifix by the church gate, a simple cross on the village green, or a St. George-surmounted column at the main cross roads. Whatever form the memorial might take the names were there—"the names of those who gave their lives in the Great War"—and, as the inscription told them, "their name liveth for evermore," and more than their name.

At the conclusion of the lecture a vote of thanks to the lecturer, moved by Major C. B. Flocton, and seconded by Mr. H. L. Paterson, was accorded.

Proposed New Thames Tunnel.

Sir Maurice Fitzmaurice, who was the engineer of the Rotherhithe Tunnel and the tramways subway under Kingsway, has been authorised by the Government to make an official full survey and to prepare plans and estimates for the construction of a road tunnel under the Thames between Gravesend and Tilbury. The tunnel would involve a large scheme of road construction and connect a great new east and west highway north of London (crossing all the main roads from the north) with the new highways in Kent, and bring the whole of Kent in direct communication with the north and west without the necessity of traffic passing through the Metropolitan area.

Additions at Bolesworth Castle.

A squash racquets court, &c., has just been completed at Bolesworth Castle, Tottenhall, near Chester. The addition includes a court and entertaining room, with visitors' gallery, heating chamber, &c., and is constructed of local stone in the courtyard of the Castle. The building possesses various unusual features, and perplexities of planning due to the differences of levels. Thus the court itself is below ground, the gallery being on the level of and with an entrance from the carriage drive, with exit at a lower level to the courtyard. The massive courtyard wall was carefully taken down to make room for the building, the face of the wall towards the drive being of tooled ashlar, and that towards the courtyard was scutched. These faces were divided and provided the two separate surfaces of the external walls of the new building, and were backed by brickwork, and so complete harmony with the Castle was obtained and the character of the whole preserved. It was essential that walls and floors should be dry, although below ground, and this was successfully met by cement concrete forming a raft over the surface, together with similar cement wall rendering with a generous fillet all round the whole performed in one operation, thus forming a tank capable either of holding or withstanding water. The work was designed by and carried out with direct labour under Mr. A. Kirby Parkinson, architect, of Chester.

TALL BUILDINGS, TALLER BUILDINGS, AND SKYSCRAPERS.—II.

BY HORACE R. APPELBEE.

IN the previous article (January 11) I showed the advantage of taller building for a given accommodation on a given area so far as light, air, sunshine and space for traffic or recreation were concerned. In this issue I propose to examine one or two details more closely, and to do this it is necessary to assume certain conditions which never exist in actual fact, such as a uniform height of story and uniform size and shape of rooms.

The height of the story will be convenient at 12 ft. 6 in. The rooms as 20 ft. deep on each side of a 6 ft. corridor will amount to 46 ft., and 4 ft. more will cover the two external walls and partitions between rooms and corridor, 50 ft. over all. The blocks to run north and south. The space between to be equal to the height of block (45 deg. light from floor level of lowest room). Every alternate space between blocks must be a street, and the intermediate ones may be streets or private property. The walls of the blocks are vertical and not stepped back. Sloping roofs are ignored. The site may be assumed unlimited from east to west, and crossed by roads in that direction; the part under consideration being a section between and exclusive of the east and west roads.

Under these conditions a block of buildings 300 ft. high will contain 24 stories, and similar blocks will be 300 ft. apart, or 350 centre to centre. If we halve the height we double the number of blocks, also they are closer; 150 ft. (12 stories) becomes 150 between and 200 centre to centre. Ten 300 ft. blocks at 350 centre to centre need 3,500 ft. run; twenty 150 ft. blocks at 200 centre to centre need 4,000 ft. run; sixty 50 ft. blocks at 100 centre to centre need 6,000 ft. run, and so on, showing greatly increased space needed for low buildings providing equal accommodation with tall buildings. Fuller details are given in the table below :—

Height of building (ft.)	300	150	100	75	50	25
Number of stories, at 12 ft. 6 in. each	24	12	8	6	4	2
Space between blocks	300	150	100	75	50	25
Distance *c.* to *c.* of blocks (50 ft. each)	350	200	150	125	100	75
Number of blocks to give equal floor area	10	20	30	40	60	120
Total space required for equal accommodation	3,500	4,000	4,500	5,000	6,000	9,000
Area of ground covered	500	1,000	1,500	2,000	3,000	6,000
Area of ground uncovered	3,000	3,000	3,000	3,000	3,000	3,000

The last line reveals a fact that will perhaps be new to many, viz., that if we fix the height of building in relation to width of street, we at the same time fix the amount of uncovered space in relation to the amount of covered space and it makes no difference whether the accommodation is on two or twenty floors. There is not any increase of congestion from this cause. The covered floor space being equal, the uncovered (street) area is also equal. It does not answer the question, Is a 50 ft. road sufficient for the local traffic with 50 ft. buildings? but it does say that if 50 ft. is sufficient, then 150 ft. between 150 ft. buildings of similar character is also sufficient.

The London Acts seem to have contemplated originally that the windows of habitable rooms should have open light to the extent of 45 deg., but there are so many exceptions that there is, I think, no case where that can be enforced except (strangely enough) in very wide streets. In a street 49 ft. wide we are limited to a building 49 ft. high plus two stories in the roof at 75 deg.; this reduces the light to the opposite ground floor to less than 45 deg. An increase of 2 ft. in the street width enables us to be 30 ft. higher with the building. At the back 45 deg. seems to have been contemplated, but was expressed as two vertical to one horizontal (67½ deg.) on the owner's property. As the back can be stepped up to the diagonal line many windows get far less than 45 deg.

The closed internal court of a building is worse still. An open space 100 ft. super. and only 8 ft. across may be 20 ft. high above window sills. On three sides we may have windows of habitable rooms or the fourth a collection of w.c.'s, urinals, and slop sinks, and at the bottom a skylight over and ventilating the ground floor. These varying arrangements would by themselves often produce habitable rooms with insufficient window space area and they are to some extent held in check by a further clause requiring a window into open air of 10 per cent. of the floor area. The effect is to break up further the lines of the "back additions."

The encouragement of higher buildings of simpler outlines (especially at the back) of equal accommodation resulting in wider streets and wider open spaces at the rear at ground or first floor levels is highly desirable. The way to it is to insist on the minimum angle of 45 deg. for light everywhere. For shops and business premises such as banks and insurance offices requiring a large area, the ground floor is exceptional always and some concession would have to be made in respect of it. I suggest that in streets of 100 ft. width and upward at pavement level the 45 deg. should be between the walls above ground floor and coupled with this a proviso that the shops did not project more than, say, 10 ft. from the upper wall or we should never get streets exceeding 100 ft. at the pavement level.

The strongest argument that can be brought against tall buildings is the fire risk. But if the buildings are properly planned is it any greater than with low buildings? Low buildings as such are not exempt. Many of us can remember the Cripplegate and Wood-street fires. London has had regulations to prevent the spread of fire for hundreds of years. The 1905 Amendment Act was the direct result of a relatively small celluloid fire, but though small there were many fatalities and injuries. Fifty years ago Chicago, or the greater part of it, was burnt out, but then it was a city of low and mostly wooden buildings and wooden "sidewalks," and fire spread easily. It is doubtful to-day if a cow kicking over an oil lamp among the straw would burn down the tall building quarter, and it may even be doubted if the cow and the oil lamp and the straw are to be found in that area. Conditions change.

When I was in Chicago many years ago I noticed many buildings had an iron cat ladder on the external wall from near street level to roof. One side of the ladder was a hose pipe, so that the fireman had no great length to carry up, and while one man was ascending to the outbreak others were attaching a hose to the foot of the fixture. At the top a hydrant (there was one on each floor) was opened and local floor hose connected. Simple, of course, but useless unless there is sufficient pressure of water, which in that place must be solely due to pumping. There are no hills in or near Chicago (the maximum is 40 ft.). There is plenty of water in Lake Michigan (an inland sea 50 miles wide at Chicago), but that is below street level. London has the advantage of being in a valley between two lines of hills 400 ft. high, which ought to assist the problem.

As an illustration of what increase of height can do, the following extracts from "The Housing Question in London, 1885 to 1900," an L.C.C. publication, will be interesting. "The streets" (of the condemned area) "were 20 in number, and the average population per room was about 2¼; 107 rooms having five or more inhabitants each.

"The streets and courts were very narrow, the widest being only 28 ft. across. . . . A large number of the houses had no back yards . . there were 730 houses . . . with population exclusive of those in lodging houses of 5,566, viz., 3,370 adults and 2,196 children. Including the lodging houses the total . . . on the area was 5,719 . . . a large proportion . . . belonging to the criminal classes. Living in one street only there were at one time no less than 64 persons who had served various terms of penal servitude" (pp. 190–191).

The new scheme :—

". . . has accommodation for 5,380 persons on the area, and in addition 18 shops and 77 workshops have been provided. . . . Every habitable room on the area is provided with a 45 deg. angle of light horizontally and vertically. The buildings are so arranged that nearly every room commands a pleasant outlook. The Entrance-avenue and the Circus are 60 ft. wide, and all principal streets 50 ft. There are three public gardens between the various blocks of dwellings of an aggregate area of nearly three-quarters of an acre" (pp. 208-209).

The present population of this area under L.C.C. is about 360 to 370 per acre. For comparison, the County of London (exclusive of the City) is about 56, and those living in the City about 28 per acre.

Mr. Voysey's interesting study (*The Builder*, December 28 last) for the Devonshire House site, shows clearly enough the advantage, so far as light and air are concerned, of tall buildings of simple lines from the ground up, in comparison with what we may expect with the sanction of the Building Acts. Perhaps I may suggest that he has provided too much accommodation for the site, and obviously he has not regarded the vertical 45 deg. as so essential as did the L.C.C. for the working-class dwellings I have referred to.

In conclusion, while advocating higher buildings, I have only done so in conjunction with wider open spaces and the abolition of closed lighting courts within a building for lighting and ventilating habitable rooms and offices. To increase the height and provide additional floor space, as in Regent-street, without widening the thoroughfare, appears to me to be a mistake, both from the æsthetic and traffic-congestion points of view. My "City of the Future," which I hope to describe some day, would be very different.

[This article is of considerable interest at the present time, but we do not necessarily agree with all the opinions expressed therein. —ED.]

Urban Housing.

Sir Charles T. Ruthen, O.B.E., Director-General of Housing, Ministry of Health, recently delivered a lecture on this subject at the College of Estate Management.

The lecturer commenced his remarks by a reference to some of the causes of the existing house shortage, and proceeded to show the attempts which had been taken during the last few years to grapple with the problem. He emphasised the fact that housing standards at the present day were considerably higher than the pre-war standards, and illustrated his point by detailed reference to some of the requirements of modern housing schemes. Another point which received careful consideration was the effect of employment conditions in the building trade on the output of houses, and the lecturer discussed at some length the vexed question of "dilution."

ARCHITECTS' AND BUILDERS' INQUIRY BUREAU.

Solid v. Hollow Floors.

SIR,—Many builders will welcome your Inquiry Bureau, which will doubtless add to the interest and usefulness of *The Builder*.

After an experience extending over 28 years I pronounce unhesitatingly in favour of the solid floor, and adopt it wherever practicable, in cottages and bungalows as well as in more expensive jobs. There are occasions when the solid floor cannot be laid with advantage, *e.g.*, where the soil level is more than, say, 1 ft. below the floor line, necessitating much filling in and ramming. Where there is a considerable space beneath the floor, one must perforce use joists and in these days of indifferent timber it is always advisable to thoroughly brush creosote the wood beneath the floor as a preventive of dry rot—not forgetting the sawn ends. The small extra cost is a good investment, especially in districts where dry rot is prevalent. The only advantage I find the hollow floor has, is that it can be laid more quickly, the coke breeze requiring a week or two to harden sufficiently to hold nails. Where time is an object, I have occasionally laid dovetailed slips in the coke breeze, but great care has to be taken to thoroughly soak the slips with creosote and well cover the whole surface with tar and mastic. If this is not done, dry rot may attack the slips and creep along under the floor. A great point in laying floors is to fix the boards pith side up, regardless as to which side is faced. This will in large measure counteract warping, which in a 7 in. board may be considerable, resulting in turned-up edges which crease floor coverings, especially lino. A word in reference to this. I have replaced scores of dry-rotted floors, and I think it is within the mark to say the inception of the rot has been caused by lino in nine cases out of ten. If this covering is to be used an uncovered margin of a few inches should be left around the room and the entire floor well stained with solignum before laying the lino.

The following advantages may be claimed for the solid floor :—

(1) A solid tread. There is a floor in my house which is part solid and part on joists. The difference in treading from one to the other is very noticeable, which I found by experiment is entirely a matter of sound, for, by closing the eyes and stopping the ears it is impossible to tell on which floor one is walking. The sense of a solid tread is, I think, generally appreciated. (2) Conduces to warmth. As there are no crevices there can be no draught. We hardly realise to what extent the discomfort of a room is due to draughts through the floor and around the skirtings. A hollow floor should always be laid with tongued and grooved boards for this reason. I have not met the objection raised by "Economist" that the surface is subject to cold and damp. In certain humid conditions of atmosphere all smooth cool surfaces inside a house will be found damp, but I cannot conceive a solid floor would be more liable than a hollow one. (3) Not so liable to dry rot. I have heard of dry rot in solid floors, but never met a case. I suspect lack of care in laying the floor. (4) Not liable to shrink away from the skirting. (5) The cost is about equal. In regard to cost—always a serious item to-day—if excavation for a hollow floor and filling for a solid, be taken as equal, the excess in cost of the solid floor is very small, say, about 5s. per square. Of course, the cost on different jobs is varied by price of aggregate and coke breeze. For purposes of comparison one has to take the following items :—(*a*) Solid floor : Level and ram earth ; cement concrete and coke breeze ; tar and mastic ; square edge flooring and labour. (*b*) Hollow floor : Level and ram earth ; lime concrete ; sleeper walls and bond; joists, tongued and grooved flooring, and labour.

As a general rule and where practicable I adopt the solid floor.

ERNEST EDWARD SMITH.

Cromer.

Damp on Ceilings.

SIR,—On Thursday and Friday of last week I noticed a peculiar fact in my house, which has caused me some worry, especially as I have not as yet been able to find any solution for it myself, nor to learn of the cause from any one else. Perhaps you would be so good as to publish the following in the hope that a solution may be forthcoming from one of your many readers.

The trouble is this. On going to bed last Thursday I noticed that the ceiling of my room which faces east, was thoroughly discoloured with damp, but on going into the next room, which faces south, there was no discoloration. Astonished at this I made an inspection of all the rooms, when my surprise was greatly increased by finding that only one of the other rooms was discoloured, and that faced north. Now, Sir, as it had not rained at all during that day nor for several days, a strange thing to say in this country at this time of the year, and as there had been no escape of steam to account for such a discoloration, and if there had been steam surely it would have been on the walls as well as they are distempered and not papered, as there were neither of these, I am at a loss. Also, if there had been rain unnoticed during the night, though so far as I am aware my roof does not leak, certainly it has never shown any signs at any other time however wet the weather, why, Sir, should the ceilings of only two rooms show signs of damp, and these rooms which face in different directions ? This last point will be appreciated the more thoroughly when it is realised that in this district there is a very considerable amount of wind, and it comes almost invariably from the south-west.

If you can answer my little riddle I shall be even the more indebted to you than at present, for if I may go so far as to refer to a personal matter, it would be to say that, living as I do so far out of things, the arrival of my weekly number of *The Builder* is an event looked forward to with very pleasant anticipation.

ERNEST MATTHEWS.

Polegate.

Acoustics.

SIR,—We have recently constructed a mess-room at the above works 32 ft. by 20 ft. by 14 ft. 6 in., having a ceiling with concave corners, and we find that the acoustics of the room are very unsatisfactory. It is very difficult to hear anyone speak, and meetings we have held have suffered very considerably in consequence. I would be glad if you could advise me of any means of obviating this trouble, or could recommend me to any firm who specialises in this line.

GEO. C. PEARSON.

Birmingham.

[We have no hesitation in referring our correspondent to Mr. Hope Bagenal, Architectural Association, Bedford-square, W.C. Mr. Bagenal has frequently contributed to these columns upon the subject of acoustics, and has been consulted by some of the leading architects of the day, who have been glad to take his very practical advice.—EDITOR.]

Plan and Specification.

SIR,—I should be obliged if you or one of your correspondents could advise me on the following query :—

"A" is erecting a small house, for which plans (one-eighth scale) and specification were prepared by an architect. "A" is supervising the erection himself ; "B" is the contractor. The plan shows three-panel doors for the internal doors, but they are specified as four-panel doors. Is "B" correct in assuming that the specification is to be followed, and not the plan ? Which is legally the more binding, the plan or the specification ?

"PERPLEXED."

Neath.

Brickmaking Machinery.

SIR,—Would you kindly ask a manufacturer of lime-sand brick machinery to let me have a fairly close estimate of the cost of the necessary machinery for producing, say, 50,000 (fifty thousand) bricks per month f.o.b. Persian Gulf ; also any other detailed information he can give me so as to form a reasonably reliable estimate of cost per 1,000 :—

	R.A.		s.	d.
Sand	13.2	100 c. ft.	19	0
Lime	95.8	„	136	0
Labour	150.	per month	7	4

and, further, whether the brick is suitable for use in a humid tropical climate.

In foundations the brick would come in contact with ground water having the following analysis :—Sodium Chloride, 6.172 ; Calcium Sulphate, 0.430 ; Magnesium Sulphate, 0.371 ; Magnesium Chloride, 0.127 grammes per 100 cc.

E. H. HARRISON.

Cement Concrete Partition Slabs.

What is the maximum length and height that cement concrete partition slabs (1½ in. to 9 in. thick and plastered both sides), can be used with safety without intermediate stiffeners, but all edges attached or bonded, and to what extent (if any) would doorways weaken them ?

"QUERY."

Inquiries Received.

INDIA.—Stone preservative solution. Particulars of two specialities sent on by post.

LANCASHIRE.—Your inquiry regarding architects and garage authorities has been answered by post.

GOVERNMENT DEPARTMENT.—Particulars of glass substitute forwarded.

BUCKS.—Information regarding the legal query you raised has been sent on to you.

"BOT."—Your inquiry with regard to red roofing tiles made in Scotland is being attended to.

BIRMINGHAM.—Particulars of reinforced concrete safes have been sent on.

RÈNEY ("WOOD-WORK MACHINERY").—Your inquiry for wood-work machinery has been answered by post.

If student will send us his address, we will be pleased to send him the particulars he requires.

New Underground Headquarters.

The new Underground offices, at the back of Electric Railway House, Broadway, Westminster, will be ready for occupation in February. Twenty-two girders, weighing 550 tons, were thrown across the platforms of St. James's Park Station, and upon the strong framework thus formed the six-story building has been built. The reconstruction work has enabled the company practically to rebuild the station and to introduce bright tiling on the platforms. The lighting has thus been remarkably improved, and the old St. James's Park Station is hardly recognisable under the new scheme of platform architecture.

Bradford Mill Collapse.

The managing director of the firm concerned stated recently that the collapse of the floors was a complete mystery, and he could not suggest a reason pending a thorough examination, which would be made. The mill was seventy-two years old, and was regarded as one of the best built in Yorkshire. At no time had the firm received any intimation from their workpeople that there were indications of the top floor being weak or of it giving way. He asked that rumours as to the cause of the accident be not accepted, but that a proper investigation be awaited.

New Building, Gresham-street and Wood-street.

In our description of this building (illustrated in our last issue) it should have been mentioned that the heating installation will be carried out by Messrs. F. A. Norris & Dutton, of St. Andrew's Hill, E.C., and fire sprinklers by Vigilant Sprinklers, Ltd., of 1, Tudor-street, E.C.

PRACTICAL DESIGN FOR BUILDING CONSTRUCTION—II.

AN ELEMENTARY EXPLANATION OF THE APPLICATION OF THE THEORY OF CONSTRUCTION TO PRACTICAL DESIGN.

By EWART S. ANDREWS, B.Sc., M.I.Struct.E., A.M.Inst.C.E.

SECTION I.—WALLS AND FOUNDATIONS (Continued).

The Strength of Brickwork.

In spite of the fact that a considerable amount of careful experiment has been made in the subject, our knowledge of the strength of brickwork is still rather indefinite. Before considering the results of some of the most important of these investigations, we will see what is usually allowed in by-laws.

The London County Council in the Steel Frame Act (1909) allow the following pressures in tons per square foot :—

Blue brick in cement mortar.....	12
Hard brick (including London stock) in ditto	8
Ordinary brick in ditto	5

Lime mortar is not allowed in brickwork under the Steel Frame Act, but the figure usually taken for brickwork in lime mortar is 3 tons per square foot; this would limit the height of a brick wall in lime mortar to 60 ft. if of constant thickness, apart from the question of floor loads of eccentric loading. As an interesting comparison we will give the results of some of the publications upon the subject.

R.I.B.A. Results.

We will take first the tests made by a committee of the R.I.B.A.; their report (1905) should be studied carefully by all requiring a full account of their experiments and results. Tests were made on piers 6 ft. high and 18 in. square; the cement mortar was 1 of Portland cement to 4 of washed river sand and their lime mortar was of grey lime in the proportion 1 to 2 and was probably stronger than that usually used in practice. Three series of tests were made and the first series gave low results. It is believed that it was discovered that the piers had not been bonded properly, and it is rumoured that, on being asked why this had occurred, the gentleman who had laid the bricks replied that he "thought they wanted them laid as we do in practice." The second and third series were bonded properly, and the following results were obtained for the crushing strengths in tons per square foot, the piers being five months old at the time of test.

	Lime Mortar.	Cement Mortar.
Stocks	18.6	39.3
Gault	31.1	51.3
Fletton ..	30.7	56.3
Leicester red ..	45.4	83.0
Stafford blue ..	114.3	135.4

We suggest that a factor of safety of 6 should be allowed for brick in cement mortar and of 8 for brick in lime mortar.

American Rules.

A comparatively recent American code (St. Louis, 1917) specifies the following allowable pressures on brickwork; the figures are in tons per square foot :—

Vitrified paving brick in cement mortar 1 : 3	20
Hard pressed brick in cement mortar 1 : 3	16
Ordinary hard and red brick cement mortar 1 : 3	13
Ordinary hard and red cement and lime mortar 1 : 1 : 3	11
Merchantable brick, good lime mortar..	6.5

Vitrified paving brick and hard-pressed brick must not crush at less than 320 tons per sq. ft.; ordinary hard and red brick must not crush at less than 150 tons per sq. ft., and merchantable brick must not crush at less than 110 tons per sq. ft.

Building Research Board's Tests on Thin Walls.

These important tests conducted by Dr. Oscar Faber were made upon thin walls with a view to obtaining information upon the bearing strength of thin walls employed in housing; a full account of the results will be found in Special Report No. 3 of the Building Research Board on "The Stability of Thin Walls," published by H.M. Stationery Office. To facilitate comparison with the results and rules already given, the figures which are given in Dr. Faber's report in pounds per square inch have been converted here into tons per square foot. The test specimen in each case was a short length of wall 14 ins. long and 8 ft. 6 ins. wide. Tests were made after the walls were from 22 to 26 days old and gave the following crushing strengths in tons per sq. ft. :—

1st Series, 4½ in. walls :

Stock bricks 1 : 3 cement mortar ..	40.9
,, ,, 1 : 6 ,, ,, ..	36.1
Fletton ,, 1 : 3 ,, ,, ..	67.0
,, ,, 1 : 6 ,, ,, ..	59.8
,, ,, 1 : 3 lime ,, ..	21.2
Concrete 1 : 2 : 4 cast in one piece ..	79.0
Concrete blocks 1 : 2 : 4 1 : 3 cement mortar	97.1

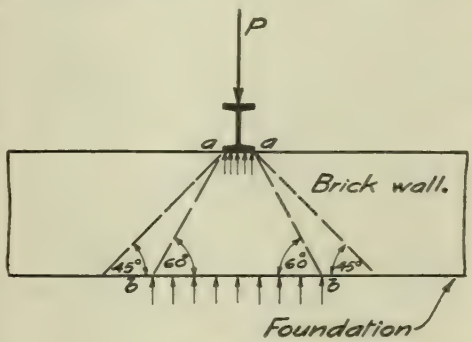


FIG. 2.

These tests were done in winter at an average temperature of 40 per cent.

2nd Series, varying thicknesses : 1 : 3 *cement mortar in each case* :

Fletton bricks on edge, 2⅞ in. thick ..	67.0
Coke breeze blocks, 3 in. thick ..	10.5
,, ,, ,, 4 in. thick ..	10.7
1 : 2 : 4 Concrete blocks, 4½ in. thick (semi-dry)	37.2
1 : 2 : 4 Concrete blocks 3 in. thick (wet process)	72.5

These tests were all made in May—a warm month.

These bring out certain very interesting and important facts; in the first place a 2⅞ in. wall of Fletton bricks on edge in cement mortar is actually stronger than a 4½ in. wall of the Fletton bricks on face in lime mortar. We also note the superiority of the wall built of concrete blocks made on the wet process over those made by the semi-dry process, as well as the comparative inferiority of the breeze block wall.

American Tests on Effects of Mortar on Strength of Brick Piers.

In Bulletin No. 300, of Columbia University, U.S.A., is given the results of interesting tests made by Professor T. S. Macgregor upon the crushing strength of small brick piers, some of face brick and some of common brick, made with various mixtures of cement and lime mortar varying from a 1 : 3 cement-sand mortar to a 1 : 3 lime sand mortar. Both the face brick and the common brick piers show higher strengths with mortars containing some lime than with mortars containing cement only, the highest strength (about 30 per cent. increase) being shown by cement mortars containing 15 to 25 per cent. of lime. Professor Macgregor explains the result of the more perfect bedding secured with the lime-mixed mortar on account of its higher plasticity, and by the decrease of the "suction" effect of the brick on the mortar.

General Conclusion from Test Results.

The general conclusion at which we have arrived as the result of the experiments which have been done up to the present on the strength of brickwork is that by careful choice of the mortar to suit the crushing strength of the brick itself and by care in preventing scamping of the work, brickwork of very high strength can be obtained. The stronger the brick, the stronger should be the strength of the mortar to develop the best strength of the brickwork; for blue bricks, for instance, a cement mortar of 1 : 2 mix can economically be employed, and the safe working pressure can then be taken at 25 tons per sq. ft. With poor bricks it is not wise to use a very hard mortar because the lack of yield on the bed is liable to lead to cracking of the bricks. There are among us some who would have us believe that the past generation of architects and builders carried out better work and were more honest as craftsmen than those of to-day. Should any of our readers share this hallucination, we recommend them to consult some of the District Surveyors of London.

Our attention was drawn a short while ago to some brick piers in London which were cracked and bulging and looking generally ill. Calculations of the loads on them showed that neglecting eccentricity of loads which would nearly double the stress, the mean pressure on one of them was 17.8 tons per sq. ft.

The wall was built of stock bricks in cement mortar, and some time after the building had been erected an optimistic plumber had generously hacked into this very bad pier to put in some hot water pipes, and had never made good. It is time that we inaugurated a Society for the Protection of Cruelty to Buildings.

"Dispersion" of Concentrated Loads.

When concentrated loads occur on brickwork, such as those due to girders resting upon brick walls, it is safe to allow a higher pressure immediately below the load than in the case of a pier in which the whole of the top surface is loaded.

Tests made many years ago by Bauschinger show that if the load may spread in two directions, as indicated in Fig. 2, we may allow the stresses to be increased by 50 per cent., and if the load comes near one edge but can spread in the other direction, we recommend that an increase of 25 per cent. be allowed.

This question of the dispersion of loads also effects the calculations of the pressures on a foundation or layer below the brickwork. If we have a pressure P applied on a length *a a* of brickwork, and we draw lines *a b* at 60 deg. to the horizontal, we find a length *b b* on the foundation upon which we may regard the pressure P as uniformly distributed for purposes of calculation of the foundations; if a similar spread or dispersion can take place in a plane at right angles we proceed in a similar manner for that plane. The angle of 60 deg. is called the *angle of dispersion*; some designers adopt an angle of 45 deg., as also shown, for this purpose, while others allow 45 deg. for stone and concrete and 60 deg. for brickwork. We believe there is evidence to support the view that the load will disperse at about an angle of 45 deg., but if we adopt that view we should allow for the fact that the pressure will be greater at the centre than at the outsides. By taking 60 deg. instead of 45 deg. and regarding the pressure as uniform over *b b* we are really making allowance for the variation in pressure.

Carlton House Terrace.

Three of the mansions at Carlton House terrace are in the process of being converted into flats. They are Nos. 8, 19, and 20 respectively.

THE SOCIETY OF ARCHITECTS.

THE thirty-ninth annual report of the Society of Architects has just been issued. In addition to those matters already announced in our pages, the following extracts are of interest:—

The Committee report that a total of 161 applications were received for admission to the various classes of membership, of which 123 were admitted, including 13 transfers to a higher class, and 5 members were reinstated. The Society lost 20 members by death, and 39 by resignation and lapses, and 5 were transferred to the retired list, the total strength of the Society on October 31, 1923, being: Fellows, 202; Members, 1,136; Honorary Members, 23; Retired Members, 41; Licentiates, 167; Students, 132; a total of 1701, being a nett total increase of 71 over last year.

The Society's arbitration rules have been redrafted and the scope of the Committee enlarged, so that it can deal not only with references as provided for in the Society's form of contract, but can also be available for reference by consent out of Court and under the order of the Court concerning matters in dispute affecting or connected with architecture, or the building or allied trades. Major Watson, F.R.I.B.A., Barrister-at-law, has been appointed Registrar of the Committee.

Competitions and Scholarships.—Last year the four quarterly Competitions and the travelling studentship and the architectural scholarship competitions were superseded by half-yearly design competitions each of the value of £40. It was found, however, that the latter did not receive the support which was anticipated owing to the greater attractions of other educational facilities such as the correspondence design course. It was, therefore, decided to discard the half-yearly design competition and to concentrate on the correspondence design course and the open competitions, viz., the Victory scholarship and the Trehearne-Norman essay competition, and the foreign travel scholarship.

Education Conference, 1924.—The Society is represented in an advisory capacity on the R.I.B.A. Board of architectural education, and has expressed its desire to co-operate and take part in the conference which is to be held under the auspices of the R.I.B.A. in the autumn of 1924.

The General Purposes Committee had referred to it the duty of submitting to the Council the names of candidates to fill the office of a Vice-President vacant by the regretted death of the late Mr. George Paine, and also vacancies on the Council due to the withdrawal of Messrs. Henry Tanner, T. Stewart Inglis, and F. Hall-Jones, who were unable to continue their services owing to the pressure of their other engagements. The Council subsequently co-opted Mr. Sullivan as a Vice-President, and Messrs. T. G. Davidson, W. G. Ingram, and P. M. Davson as ordinary members of the Council. To the vacancy caused by the transfer of Mr. Sullivan to the office of a Vice-President, the Council co-opted Mr. C. F. Norman.

With regard to the question of Unification and Registration, the dissolution of the Unification and Registration Committee of 1922 was followed by an announcement in the R.I.B.A. Journal of January 13, 1923, of a draft Bill for the registration of architects prepared by the Registration Committee of the R.I.B.A. and approved by that Council. The first official communication which the Society received from the Institute on the subject was a letter, dated January 23, enclosing a copy of the Bill which it was stated was to be introduced into the House of Lords the following month. This draft Bill differed in points of detail from the print in the R.I.B.A. Journal. It was considered by the Council of the Society on January 25, and an intimation was sent to the R.I.B.A. that the Society was unable to support the proposal in the form in which it was then presented. The draft Bill was presented to the general body of members of the R.I.B.A. on January 29, when the meeting decided not to consider it until the other professional societies and interests affected had been consulted and a general consensus of opinion obtained in favour of the Bill.

General.—The Annual Report being mainly a record of work in hand and accomplished, necessarily gives little indication to the members as to how the results were obtained. The greater part of the detail work of the Society is done in Committee and the members of the Society will realise that their representatives on the Council are called upon to devote a great deal of time to its affairs. It follows, therefore, that service on the governing body of the Society is an honour which carries with it a great deal of responsibility and entails much personal attention to the work.

BOOK REVIEWS.

Quantity Surveying for Builders. By WILFRID L. EVERSHED, F.S.I. The "D.U." Technical Series. (London: Chapman & Hall, Ltd. Price 10s. 6d. net.) 1923.

The author has succeeded in producing an essentially practical work, and one which will be found of great assistance to the student of quantity taking. It consists largely of examination papers of the City and Guilds of London Institute, and of the Surveyors' Institution, with examples of the answers to many of them. The author quite wisely credits quantity surveyors with a certain degree of individuality, a characteristic that many feared would be eliminated by the production of a "Standard" method. This, however, is happily not the case, so that while in some instances one would not be in complete agreement with some of the methods advocated in the book under review, the student on the whole may be safely recommended to study the work closely in the early stages of his training, leaving the personal element to the time when he can run alone. There is a long series of tables of volumes and areas with algebraic formulæ, but we think in practice the surveyor would use the more rough and ready methods now in use, which are to all intents and purposes practically correct.

The system of "timesing" and "dotting on" described on pp. 34 and 35 are somewhat confusing, and we think there is a clerical error in examples Nos. 31 and 32.

To be somewhat hypercritical, perhaps one might wish the method of arriving at the number of rolls in example No. 55 and the size of soakers in example No. 62 were more explicit, while we cannot understand how the width of boarding and lead to valley in the latter example is arrived at. Taking the work as a whole, it will be found most useful to the student for examination purposes, as well as for practical use in the exercise of his profession, and one which merits a place in the front rank of modern technical works.

Some Factors relating to the Re-housing of Slum Dwellers. By JOHN J. CLARKE, M.A. The University Press of Liverpool, Ltd. (London: Hodder & Stoughton, Ltd.) Price 2s. net.

It was opportune that this paper should have been read to the British Association when that body was meeting in a city that has been a pioneer in slum clearance, and that has also been in the forefront with large post-war housing schemes. The paper here reproduced deals with re-housing in three main divisions: before the war, after the war, and in the future—and the full horror of the slums is revealed. Tables of mortality are given covering a three years' average in an insanitary area, the same average in the area after reconstruction, and the same over the whole city. The following figures are those of infant mortality: 259, 162, 119 per thousand, the phthisis rate being 4.0, 1.9, 1.7. Such figures speak for themselves, and we must note that the figures for the reconstructed area are not as good as they should be because the inhabitants are dispossessed slum tenants on whom slum life has left its mark. We are reminded that there are 72,000 back-to-back houses in Leeds where adequate ventilation is impossible, and that similar conditions throughout the country are responsible for the existence of 1,166,784 children defective in some respect out of a total of 2,434,252 examined. In 1920 the insured population of England and Wales lost fourteen million weeks of work through sickness, most of it preventable. The following example is cited in illustration of the kind of conditions that thousands of our fellow-citizens have to tolerate; it is a description of a house that is rather typical than unique:—

The ground floor is occupied as workshops.

First Floor.—Two rooms: occupied by four adults. One room: husband, wife, and five children, aged ten and under. One room: lodger. One room: single woman.

Attic.—Husband, wife, and one child.

The roof leaks badly, and as the man, an ex-soldier, stood on the chair to repair it, the four legs slipped through the rotten floor. The rent was 3s. 6d. per week, but in consequence of his improvements it has been increased to 4s. 6d. per week. The total rentals derived from this house are about £170 per annum.

As a further example of the outrageous state of affairs at present existing we are given the following particulars of houses with rooms to let "furnished":—

Rent of house.	Tenant receives
6s. 2d. per week ...	32s. 6d. for rooms.
5s. 6d. ,, ...	36s. 4d. ,,
5s. 6d. ,, ...	32s. 8d. ,,
5s. 5d. ,, ...	34s. 0d. ,,
5s. 5d. ,, ...	42s. 0d. ,,

The author rightly insists that it is a fallacy to suppose that the normal slum dweller will not respond to better conditions, and we are assured that where the chance has been given "undoubtedly the improved environment has had a beneficial effect upon the character and health of the people." It is further asserted that the country could spend without loss £50,000,000 annually, or, capitalised at 5 per cent., £1,000,000,000, on clearing the slum areas and securing better housing and living accommodation, provided that the cost of sickness and disablement were thereby reduced by one-third; for every penny spent on housing we save the rates threepence on other public services.

The paper contains some considerations of the transport problem, especially in connection with the Liverpool docks, and a proposal for a great national scheme for re-housing slum dwellers is formulated. It is to be hoped that this paper will be read and taken to heart, since nothing but the force of public opinion is likely to make politicians and public bodies take the slum problem with the seriousness that it imperatively demands.

THE BUILDING TRADE.

MODERN BUILDERS' MACHINERY.

By STAFFORD RANSOME.

II.—THE SELECTION OF MACHINERY.

THE selection of a builder's plant, even if it is only a small one and the expenditure involved is not large, is a matter of the greatest importance if efficiency, profit and freedom from difficulties are to be secured. If a builder purchases bad materials for construction, bricks, cement, timber, or hardware, it may land him into difficulties in connection with the contracts for which he uses them, but there the matter, serious as it may be, ends. With bad machinery, however, there is no end to his difficulties and losses so long as that machinery is kept running. He goes on steadily wasting materials and turning out bad work until the day comes when he scraps his plant, and the sooner that day arrives the better for him.

It may be taken for granted that the large builder who has been using an extensive plant of wood-working machinery, and possibly a number of plants in different parts of the country, has a good idea of what he requires when he wishes to extend his installations. At all events, he usually has in his employ in connection with his wood conversion department highly competent sawmill experts, who should be fully alive to all new moves on the part of the manufacturers of machines and are consequently able to advise him in making his selection. With the medium and small man, however, such is by no means always the case. He must therefore rely on his own judgment and common sense, which may or may not be backed by any great technical knowledge in selecting his machinery.

The Sources of Supply.

Let us first consider the market from which he can pick and choose. In Britain, at all events, he is far better off in this respect than is the purchaser in any other country. Not only has he about a dozen British manufacturers, any one of whom will be able to fit him out with anything that he may require, but he will find as many more who make certain of the machines which would answer his purpose, though they could not complete his outfit. Quite apart from these, however, he has all the American, French, German, Austrian, Swiss, Scandinavian and Belgian makers sitting on his doorstep, for there is not a single important foreign maker of wood-working machinery in the whole world, of any sort of reputation, good or bad, who is not actively represented in England.

Foreign Machinery.

Many of these foreign firms carry stocks in this country. It is not my purpose here to discuss the virtues and vices of Free Trade and Protection, but in considering the question of the selection of machinery we cannot ignore the fact that under the former the builder in Great Britain has a far wider selection of makers to choose from than can occur in any other country under the sun. The only thing that he has to worry himself about is the question as to what *is* the best for his purpose. That question, however, is in itself a big one, and is greatly accentuated by the immense variety of machines which are at his disposal to choose from. It is further complicated by the diversity of the prices asked for by the different makers for apparently the same thing and by the sometimes exaggerated statements made by over-zealous salesmen as to the capacities and qualities of their respective machines.

In advising on the selection of wood-working machines, generalisation as a rule is apt to be both unsatisfactory and misleading. There is, however, one matter about which we may lay down a definite rule which covers all cases. That is, that it is always a fatal mistake to purchase a cheap machine because it is cheap. Get the best machine that is available for your purpose, not necessarily the most elaborate one, because you may not want extraordinarily high speeds of output, but get the best for your requirements and strike the best bargain in purchasing it that you can with the maker.

At the present day, speaking for the moment of British machines only, there is no scope for any considerable difference of price in the same type of machine from different makers unless the quality of those machines varies accordingly. Either the one is good and the other bad, or the one possesses certain features in materials, design or construction that are not possessed by the other. These differences and their value may not always be easily apparent to the unsophisticated purchaser, but they will be there and will be appreciable to the expert.

Tools of Precision.

We must bear in mind that practically all wood-working machines are, or should be, tools of precision. They all have to produce extremely fine and accurate work, and most of it is done by spindles revolving at very high speeds. The difference between good and bad planing, for instance, may sometimes be represented by one-thousandth of an inch, and the unnecessary waste of $\frac{1}{32}$ in. in the thickness of a saw-cut may make the difference between profit and loss. Machines for effecting this exactitude at high speeds do not lend themselves to being manufactured on the mass production principle, and they are never so made. All the makers manufacture virtually under approximately the same conditions as to labour and materials and facilities, and it is only by applying the principle of mass production to these machines that they could drastically reduce their cost. We may therefore take it as an axiom that variation in prices quoted, except within a very narrow margin, means a difference in the quality of the machines. Many builders start using machinery at an early stage in their career, when their financial resources are strictly limited, and in their anxiety to equip themselves they are more frequently apt to fall victims to the cheap maker. Such a policy often spells disaster, and has sometimes turned what would have been a profitable contract into a loss, at a time when a beginner was struggling to make headway.

It must be accepted as a fact that the difference in cost between good and bad machines will, as a rule, be paid for over and over again by the good machinery, if kept at work, in the course of a few months and often in only a few weeks. If, therefore, a purchaser considers that he has just enough money to pay the price of a cheap plant, but not of a higher-priced one, he will be wise to keep his money in his pocket until he can afford to raise the extra money. If such a man cannot get the manufacturers of the better machines to give him a certain amount of credit for a portion of the plant, it should not be difficult for the purchaser to arrange for someone outside to finance his purchase for him, provided that he can show he has *bona-fide* contracts which justify the purchase of machinery. This is merely a legitimate business proposition.

Some years ago I was consulted by a builder whose machinery was giving a lot of trouble. He was a beginner, and had only four simple machines, a saw bench, a mortising and boring machine, an irregular spindle and an over-and-under planer. He could not get good work, he had had constant troubles with his bearings and some breakages.

"Why did you buy this rubbish?" I asked him.

"Well," he said, "this contract is very rushed. I hadn't time even to put up a proper building for the machines, and I have to use them rather roughly, so I didn't think that it was worth while getting a more expensive plant, especially as I don't know whether I shall want the machines when this contract is done."

I explained to him that if he had purchased a good plant in the first instance it would have been saleable at the end of his contract for far more than the difference between the prices of the good and bad plant. It is true that the machines were being badly used, badly housed, and apparently handled without that care which is essential to the best results. But they were bad throughout, light, flimsy and roughly fitted. Properly constructed wood-working machines will always stand harsher treatment than bad ones, and they are much more easily adjusted and worked than are those of inferior quality.

In going into figures it was found that his machines, exclusive of the motive power, which was good enough, had cost him about £300, and breakages, repairs, stoppages and unnecessary labour had cost him in a few months another £250, and he had wasted a large quantity of material. He could have purchased a properly-made plant for rather less than £400. Thus, even when a builder has to subject his machines to rather rough treatment and to force their output, as is sometimes the case, especially when machines are accommodated temporarily in connection with a hurried contract, the best machines are by far the cheapest.

Metric Standards.

Quite apart from the question of sentiment or patriotism or quality, there is a difficulty in using Continental machines in this country, and that is that as all their parts are made to metric measurements, they do not conform to our standards. Thus, we may have a saw of 39.4 in. dia. capable of cutting a board 14.9 in. deep. The widths and diameters of the pulleys are also of odd dimensions, as are also the diameters of the spindles and bearings. Moreover, the threads of the screws which, in case of repairs, cannot be cut with British standard taps and dies, and the heads of the screws and bolts which cannot be negotiated by our keys and spanners. Driving pulleys, too, have to be revised, and repairs in the case of accidents or wear are difficult, costly and sometimes impossible.

American Machines.

The American machines that are offered to the builder in this country, and their name is legion, do not suffer from the same disadvantage of differing from our standard dimensions, and many of them are highly ingenious. More particularly is this so in the case of special tools for a particular class of work, such as sand-papering machines of elaborate design, ply-wood machinery, twin band saws for re-sawing, &c. None of these, however, is of interest to the ordinary builder in this country, and but few are required even by the large builder. Of the more general purpose American machines, there is little to differentiate them from those of British make, and certainly their quality is no better than that of the average British machines. As a rule, too, when compared with the best British machines, they are of a less durable construction.

The makers of different nationalities are quick to adopt any improvement that occurs in the designs of their foreign competitors, and British firms are very much alive to anything which goes on elsewhere in this respect. Their own models have been copied all over the world in times gone by, and, if the absence of an import tariff is of any good from the point of view of the manufacturer in the country where there is no duty on foreign machinery, it is that it affords him a very excellent opportunity to see every machine in the world with which he has to compete and to take measures to adopt anything new and to

improve upon those novelties in designing his own machines. It is for this reason that the best British wood-working machinery is always up to date. The British manufacturer cannot help knowing what he is up against by the object lessons afforded by the foreign machinery which is dumped at his door.

German Machinery.

Before the war if a builder in this country used other than British wood-working machinery it was usually of German construction. There were two reasons for this. First, it was extremely cheap, and, second, the purchaser could demand and obtain practically any terms of payment that suited him. There was never any question of the quality of such machines. They were in nearly every case belated copies of the American designs, and bad at that. In fact, many of these German machines were in design ten or fifteen years behind the rest of the world. Nevertheless, they sold because there is, and always will be, a class of customer to whom low first cost and credit facilities must appeal irresistibly.

To sum the matter up I would say again, that if the builder is to get the best or even good results he must purchase the best machinery that is procurable. In most cases for his purposes unquestionably British machines are the best. But he must remember that there are good and bad British machines. Let the purchaser look around and examine everything that is offered to him, and unless he is a man of technical experience let him get expert advice, for, as a builder once said to me, "one machine looks very much like another." That is actually the real danger which the unsophisticated or careless purchaser has to face.

THE NATIONAL ASSOCIATION OF MASTER PLASTERERS.

THE National Association of Master Plasterers held their annual dinner at the Holborn Restaurant on January 14. Mr. J. E. Chadwick, the President, was in the chair.

After the loyal toasts had been honoured, Mr. E. J. Brown, in proposing "The National Association of Master Plasterers," said he thought the building trade and the Association had a troublesome period ahead of them for many years to come. Owing to the shortage of skilled labour they were bound to find the situation very difficult. He appealed for unity among the builders, plasterers, plumbers, and allied trades.

Mr. H. H. Hodkin, in responding, said the plasterers were the friends of the builder, and tried to smooth the way in many directions. They kept the balance, and acted, as it were, as ballast. They wished to run on parallel lines and not diverge in an opposite direction. It was necessary that they should get to know one another. The bulk of them, after all, were connected with the London Master Builders' Association. At the same time, although they had much in common, the National Association ought not to lose its own identity.

Mr. Roland B. Chessum, in proposing "The President and Officers," said he wished the President every success in the position he now occupied. To a certain extent it depended on the assistance he received from his officers. The present situation made it a more strenuous office than it had ever been before. Years ago it was child's play compared with its onerous character at the present time. Although only representing one craft, there was a multitude of duties to be attended to by the President and his officers. They would be in a happy position if they could roll out the rough places in life to make it a bit easier for those that came after them. If they worked for the benefit of the industry, and the community in general, it would be much better than a merely selfish attitude towards their own particular problems.

The President, in responding, said the various trades were dependent on each other. In regard to their various troubles it was a poor soldier that turned his back upon difficulties. The Association would carry on for the best of everyone, and give credit to others for the desire to see eye to eye with them.

Mr. Samuel Wright, in proposing "The Visitors," said there was close co-operation between the sub-contractors and the London Master Builders' Association. There was no man like an expert to carry out the work of any particular branch—particularly so in the case of plasterers. They either inherited their craft, or spent years of their life in training. Their branch of the building trade was one of the oldest and one of the most important. The first pre-historic joiner had to call in the plasterer to join up the cracks. The master craftsman would remain for many years yet to come.

Mr. Somers, in briefly responding, mentioned that he had been connected with the Master Builders for a period of seven or eight years.

ELECTRICAL CONTRACTORS' ASSOCIATION.

ON January 15, at the Hotel Cecil, Mr. Robert Robson (President) occupied the chair at the annual dinner of the Electrical Contractors' Association, when some 170 guests and members were present.

After the loyal toasts had been honoured, Sir James L. Devonshire, K.B.E., proposed "The Allied Associations and Honorary Officials." It was the first time, he said, he realised that, since 1915, the Association really consisted of three Associations. In 1909 the Association secured an important clause for the protection of its members; and again in 1919 secured there should be no unfair municipal competition. It could not be too often emphasised that the success of any industry depended on the success of its retail traders.

In responding on behalf of the Allied Associations, Mr. R. Robson said he would like to see the Association spirit installed in every one of their members. If they could get enthusiasm members could carry through any project they had in hand. Their members were the last link between the public and the manufacturers; and it was up to them to educate the public in the use of electricity. He maintained that it was their duty to sell to the public electrical apparatus; and they should sell it in their own premises. He contended that the electrical industry was only in the infancy of its possible development; they had a tremendous field in front of them, and if they only realised it there was work for all of them.

In regard to the Wembley Exhibition, it was for the good of their industry, and they had just passed a resolution to induce other sections of the industry to use British material. By other sections he meant the merchants who supplied them with material. In regard to the Supply Authorities the first thing was to get on good terms with them, and when they were on a friendly footing it would be easier to open up negotiations than as strangers. It was also important to get their members on the City councils.

He was very glad to know that voluntary registration of electrical contractors was almost in being. In a few weeks he hoped contractors would be asked to register.

Mr. W. R. Rawlings proposed "The Guests," and, in responding, Sir John Snell said the duties of the Commissioners were of a fairly arduous character. As a result of a survey that had been made throughout the country by engineers it was estimated that within the next ten years the output of electricity in this country would be multiplied by 2½ to 3 times. It was really extraordinary that within the short time the Commission had been in being amongst local authorities it had to deal with 1,700 applications for loan grants.

Although it was only natural that electrical contractors should wish to carry out large contracts, he would put in a plea for the smaller premises. With the electrification of railways it should be possible to extend to rural districts electrical manufactures. This would go a long way to help the architects in their national cause of encouraging the people to leave the towns and settle in healthy country districts.

After Dr. Alex. Russell responded further for the guests the toast of "The Electrical Development Association" was proposed by Mr. H. Marryat and seconded by Mr. W. B. Woodhouse.

In conclusion, Mr. H. T. Young proposed "The Chairman," to which Mr. R. Robson briefly responded.

NEWCASTLE BUILDING TRADES' ASSOCIATION.

MR. THOMAS BERTRAM occupied the chair at the annual dinner of the Newcastle and Tyne District Building Trades' Employers' Association held on January 11.

The Building trade was submitted by Ald. Bramble, who said it was an industry they all wished to encourage. He spoke in appreciative terms of the work of the Association, whose activities were for the good of both the industry and the public, stabilising the trade, and creating harmony between employers and employees. He felt sure if there were fewer official restrictions and more freedom the industry would get along a good deal better.

Replying, the President made reference to building charges, and said 1914 costs would never return in the time of those present. During the next six years costs in the building trade would be between 60 and 75 per cent. above 1914. These facts must be appreciated and looked fairly in the face, and from a business standpoint. There was a more settled state in the industry which warranted the hope that in a short time the cogs would be moving considerably more rapidly than at the moment. The advances in wages just awarded on the sliding scale meant a return to first-class work, and there was no possibility of wages coming down. The building trade would now get away from a class of building which some of them did not consider exactly creditable to the industry—the building erected under stress of circumstances.

Replying, Major Steele said he thought every builder would like to go back to the times when craftsmanship was a pride. Owing to the commercialism of the last half century he was afraid craftsmanship as an art had declined, but he prophesied a return from signs of the present day.

TENDERS.

Received Too Late for Classification.

CATHERINGTON.—For Cowplain Water Scheme, for the R.D.C. Mr. G. C. Vernon-Inkpen, architect, 40, Commercial-road, Portsmouth:—

F. J. Privett, Portsmouth	£7,977	0	0
F. Bevis, Portsmouth	6,373	0	0
Gunn McNeill, Ltd., Westminster	6,300	0	0
The Lux Solis Lighting Co., Earley Station	5,960	14	3
C. E. Harvey, Prinstead, Emsworth	5,433	11	0
J. Hunt, Gosport	5,400	0	0
H. H. Barry, Nottingham	4,945	0	0
The Standard Construction Co., Swansea	4,866	10	4
P. Trentham, Ltd., London	4,732	15	0
H. Osman & Co., Shirley, Southampton	4,622	16	0
Crawford Bros., Havant	4,612	17	6
J. Croad, Portsmouth	4,600	0	0
*A. Streeter & Co., Ltd., Godalming	4,097	15	2

CHADWELL HEATH.—For erection of house and shop, for Mr. Robinson. Mr. E. Meredith, architect, 7, Goodmayes-road, Goodmayes, Essex:—

T. L. Hughes, Ltd., Ilford	£1,490
Luton & Sons, Stratford	1,468
Baker, Hammond & Laver, Rainham	1,272
*Romain & Sons, Chadwell Heath	1,249

GOLDER'S GREEN.—For erection of house, for Mr. Tozer. Mr. E. Meredith, architect, 7, Goodmayes-road, Goodmayes, Essex:—

Tavener & Son, London	£1,770
W. J. Lovell & Son, London	1,735
*H. J. Gower, Ltd., London	1,497

GOLDER'S GREEN.—For erection of six houses (and/or two lock-up garages) corner of Elmcroft-crescent and Hamilton-road:—

	Six houses.	*Two garages.*
G. E. Scutt	£6,500	—
Guild Housing, Ltd.	6,160	256
H. J. Gilbert & Sons	5,500	250
W. A. Taylor	5,400	225
Richardson & Howard	4,549	185
F. W. Romain & Sons	4,457	—
Allen Fairhead & Son	4,141	195
Thatcher & Pritchard	3,969	153
*J. E. Billings	3,695	179

THE PRINCIPLES AND PRACTICE OF ESTIMATING.

We give the following extracts from a paper on this subject read by Mr. T. SUMNER SMITH, F.S.I., before the Institute of Builders (Manchester Branch) on January 14:—

In considering the principles and practice of estimating in building works, we shall begin with the assumption that anyone desirous of acquiring the art and science of estimating is already equipped with a sound knowledge in construction, familiar with materials and their usages, and their conversion from the raw state to the finished product (except in those instances where they are a manufactured article, as, for example, bricks, cement, and the like, when he should be acquainted with their application to building works), also that he is conversant with craftsmanship and the methods employed in the execution thereof, and the amount of work a man is capable of performing in a given time, and finally, he is fairly well grounded in the principles and practice in the measurement of artificers' work. To those qualifications might also be added a sense of judgment of values. But this is largely a matter of experience, founded upon a catholicity of knowledge derived from amongst others, observation, induction, empirical comparisons of things of similar or like kind, always with an eye as to their costs, and also with a due sense of proportion of the fitness of things in their relation to one another. As to this, he would never compare, say, the price per cubic yard of concrete used in great bulk in which there had been facilities for handling and execution with that of a small quantity in which the conditions were the reverse—no proportion betwixt them as regards value.

The principal methods of estimating may be said to be two:—

(1) Pricing from correctly ascertained data of a like kind; (2) Pricing from data of a like kind, confirmed and checked by empirical methods founded upon experience.

The former may be taught and learned just as any other subject, and presents no great difficulties. The latter is more difficult to each and learn; but it is possible, bearing in mind that anything may be taught successfully when its application is understood and that it may be acquired by the right aptitude and industry.

Both are somewhat similar, but the difference is in the kind of experience.

Analysis.

Of the essential principles underlying estimating for building works analysis is one of the most important. Particularly so does estimating call forth for this, since by our system the modes of measurements are expressed, as a general rule, for artificers' work, in terms different from the purchase terms of materials; further, artificers' work may be composed of several and distinct kinds of materials whose values differ, and it may sometimes happen that their purchase terms differ. Take the example of a cubic yard of cement concrete. It is invariably made up of broken bricks or stone, shingle or gravel, ashes or coke breeze, or slag, together with sand and cement and water. The purchase terms of broken bricks, etc., and sand may either be by weight or by volume, whilst the purchase term of cement is by weight, and that of water by the gallon. And the value may vary in each case, even though bought on the same purchase terms. Similarly, there may be various kinds of labour employed whose rates of remuneration differ. Then, again, railway rates and cartage rates may vary—the price per ton of sand will obviously be less than the price per ton of cement, as the latter may require protection from inclement weather.

Also, although one may purchase sand at a rate on the terms of so much per cubic yard, the railway rate is invariably that based upon the terms of so much per ton. Here, then, we have a simple commodity or compound article, cement concrete, which, on analysis, for the purpose of estimating, presents numerous problems for solution. Analysis, then, is the first step in arriving at the price.

Reverting to our example: a cubic yard of cement concrete, say, composed of 5 parts broken brick, one part sand and one part cement, I propose to examine in detail the problems as they present themselves, and to give illustrations of the methods by which they may be solved with a view of ultimately arriving at the price per cubic yard.

The quantities of materials required to make a cubic yard of cement concrete are an important factor of the cost. It would be wrong to assume that the quantity of broken bricks in this case plus the quantity of sand and quantity of cement is equal to the volume of the finished concrete. Thus, five cubic yards of broken bricks, one cubic yard of sand, and one cubic yard of cement will not make 7 cubic yards of cement concrete since the grains of sand and cement fill, to a certain extent, the spaces or voids between the broken bricks. It is also incorrect, on the other hand, to assume the quantity of broken bricks alone as being exactly equal to the volume of the concrete, because the introduction of sand and cement may be in excess of the actual voids. Further, it is also incorrect to assume that the quantity of broken bricks must be either less or exactly equal to the volume of the finished concrete, because it depends upon whether the amount of sand and cement introduced is equal to the actual voids. In the example I have given the broken bricks amount to 1.2 or 1 1-5th cubic yard in volume to the finished cubic yard of cement concrete. To the beginner this may seem paradoxical, but as to this I will make clear later. Suffice it to say, it will have served the purpose of the illustration if it should have aroused your curiosity and have prompted you to argue a question in your mind as to how or why is it feasible to pack 1.2 cubic yards of materials into one cubic yard. And by this it will now be understood what I meant when I stated previously that an estimator must cultivate an inquiring and critical mind. He should exercise well and keep alert the critical faculty. It is so essential that the beginner should at the outset grasp the fact that it is possible to put more materials by measure into a smaller measure that I shall illustrate it by a simile.

For my simile I shall take water as my illustration. Pure water at a given temperature—39.2 deg. F.—is at its greatest density, and one gallon weighs 10 lb., or 6.25 gallons or 62.5 lb. equals approximately one cubic foot. Water at its greatest density is neither expandible nor compressible, but by increasing the temperature to 212 deg. F. water is converted into steam, and 1 lb. of steam at this temperature at atmospheric pressure will occupy approximately a space of 26 cubic feet, and by increasing the temperature, say, to 394 deg. F. 1 lb. of steam will withstand or exert a pressure of 230lb. per square inch, and will occupy only 2 cubic feet of space. So that by increasing the temperature the same weight of steam will occupy less space, in this case 13 times less, only, of course, it exerts greater pressure. We may, for our purpose, eliminate the point about pressure. However, what I wish to impress upon you is this: that these are recognised and accepted facts. I cite them to show that dubiousness alone will not suffice, but rather that you must proceed along the lines of reason in solving your problem. Our first problem, therefore, in arriving at the quantity of materials in a cubic yard of cement concrete is that of voids. How are we to ascertain and determine the amount of voids?

Voids.

The determination of voids of a unit volume of aggregate has been ascertained in the past mainly by actual trial—by filling a watertight box (a convenient size is 4 ft. 6 in. by 3 ft. by 2 ft.=27 ft. cube=1 yard cube) well wetted to avoid further absorption, and measuring the volume of water it is necessary to pour in to fill up all the interstices. The voids in sand were determined and ascertained in a similar manner. In practice these void tests gave anything but satisfactory results. In the case of sand the moisture which the sand contains so affects its volume that this test is scarcely of any value. If the sand is dry, for example, a fine sand with grains of a uniform size will have about the same percentage of voids as a coarse sand with uniform grains; whilst, on the other hand, if sand when tested contains natural moisture, the amount of this varies so much from day to day that the original volume of the sand, and, in fact, the volume of the voids, may be affected to the extent of 10 per cent. An increase in the percentage of moisture increases the bulk of sand and likewise the voids up to a certain point. The correct way to determine the voids of a unit of aggregate or sand is to ascertain the specific gravity of the materials. The specific gravity of a substance is the ratio of the weight of a given volume to the weight of the same volume of distilled water at a temperature of 62 deg. F. For ordinary tests of aggregate and sand the water need not be distilled and may be at ordinary temperature—say from 60 deg. to 80 deg. For ordinary bricks the specific gravity is 1.90, and the weight per cubic foot 118 lb. The specific gravity of sandstone may be taken as 2.6 and the weight of a solid cubic foot 160 lbs. As a rule the voids in cement are not ascertained. Loose Portland cement averages per cubic foot about 92 lb., but when packed tight averages about 115 lb. Portland cement is assumed in standard proportions to weigh 100 lb. per cubic foot

Specific gravity multiplied by 62.32=weight of a cubic foot in pounds. Therefore weights of aggregate or sand divided by 62.32 gives specific gravity.

Analysis showed that in a yard of 7:1 concrete there was .728 of a cubic foot of solid matter in excess, approximately 2.6 per cent. without considering the volume occupied, if any, by the water used in mixing. But in practice it is reasonable to assume that not every particle of solid matter is actually used. Quitting for the moment the point with reference to water, we can only say that this 2.6 per cent. is greater or less waste than is required by actual tests, either in the form of research or data derived from actual operations. Some waste will actually take place. Hence, the estimator must know this, to estimate accurately.

As regards water: what is the quantity required for a cubic yard of concrete? Does this vary with the temperature, the dryness and density of the materials? Again, does the cellular construction of the materials have any effect upon the quantity of water required? All these are matters awaiting investigation. Further, does an excessive amount of water weaken concrete, and, conversely, an absence of a correct quantity diminish the strength of concrete? We know that concrete sets a conglomerate mass physically as a result of the hydration of the cement. What causes the cementitiousness of the mass into a conglomerate whole remains as yet a mystery. We even as yet do not know whether the water combines chemically and consequently occupies no space in the mass; if, on the other hand, it retains a separate entity, then on evaporation the concrete would be honeycombed to the extent of the space occupied by the water used in mixing.

Organisation.

Another factor that must be taken into consideration by the estimator is the matter of

organisation. I do not refer particularly to the organisation of men in the performance of task work so much as the organisation for getting the materials to the men. It is futile to estimate the labour cost from constants of labour or any data which gives the time of performance for a given task under certain conditions, unless those conditions will actually apply in the particular case under review. The first thing requisite is that the materials and the correct implements shall be at hand for the man to perform the task, and the next thing, whether it is possible for it to be done in the time which it is thought it ought to take to perform the task.

Pricing.

Of course, in pricing, the most difficult of all is that of determining the labour costs. The actual amount of materials to be used, their value, and all charges upon them may be estimated with accuracy to within reasonable limits. Not so the labour costs. We may by analysis calculate the materials, but analysis of labour costs will not help us materially, unless we have data of costings of similar works, and that they would be applicable to the case under review.

Summary.

Summarising, the principles of estimating necessitate the splitting up of an item into its component parts, and each unit treated separately for costs, and which should be in relation to its component parts where they are affected by relation thereto. Taking our illustration of excavation as an example, the percentage to be added for plant must be considered in relation to the class of work, as it is obvious were the item a piece of joinery work the cost of plant would be greater than 4 per cent.

Owing to our method of measurements we mix up materials with labour, with certain exceptions, notably stonework. This complicates matters and renders it difficult for the installation of a scientific system of investigation—by costing or other means—for arriving at the cost of the respective units or the component parts of an item. When such has been ascertained the data may be rendered useless by a fluctuation in cost of any one of its component parts. For instance, why should not excavation be considered apart from filling-in, and these quite apart from carting away, tips, fees, overhead charges, and profits?

Unfortunately, since we have to consider the price of an item of many parts we are compelled to base our price mainly upon assumptions, but this is even more reliable than lumping or guessing the price, or because we know that so-and-so price for such an item is 10s. we must cut it by one penny to get the job, whether we can do it at 9s. 11d. or not. Would it not be more sensible to see whether we could do it for 9s., and if we can let that be the price, then the bogey of competition is non-existent.

Conclusion.

In conclusion, a scientific study of pricing, seeing that it must of necessity take into consideration a review of the whole field of operations, may ultimately lead to a reduction in costs, whilst at the same time it may not only assume profits but benefit the country in general by a reduction in the cost of building and engineering works, and guarantee better wages.

Concrete is now used in building, and engineering works beyond the dreams of those of 30 years ago, but it is as yet only in its initial stages. The study of the uses of concrete and its costs may effect many savings. For example: It is possible to reduce the time of setting of concrete by 100 per cent., and at the same time increase its hardness and watertightness, with the result that buildings and engineering works, particularly roads, may be completed in much less time than it ever were possible before, and superior to anything known in the past.

RATES OF WAGES IN THE BUILDING TRADE.

The following are the rates of wages in the building trade in England and Wales. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

	Masons.	Bricklayers.	C'p'ters. Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Labourers.
Aberdare	1/7	1/7	1/7	1/7	1/7	1/7	1/7	1/2½
Accrington	1/7	1/7	1/7	1/7	1/7	1/7	1/7	1/2½
Altrincham	1/7	1/7	1/7	1/7	1/7	1/7	1/7	1/2½
Ashton-under-Lyne	1/7	1/7	1/7	1/7	1/7	1/7	1/7	1/2½
Barnsley	1/7	1/7	1/7	1/7	1/7	1/7	1/7	1/2½
Barrow-in-Furness	1/7	1/7	1/7	1/7	1/7	1/7	1/7	1/2½
Barry	1/7	1/7	1/7	1/7	1/7	1/7	1/7	1/2½
Bath	1/4	1/4	1/4	1/4	1/4	1/4	1/4	1/0
Bedford	1/4½	1/4½	1/4½	1/4½	1/4½	1/4½	1/4½	1/0½
Birkenhead	1/9	1/9	1/8½	1/9	1/9	1/9	1/8½	1/4
Birmingham	1/7	1/7	1/7	1/7	1/7	1/7	1/7	1/2½
Bishop Auckland	1/7	1/7	1/7	1/7	1/7	1/7	1/7	1/2½
Blackburn	1/7	1/7	1/7	1/7	1/7	1/7	1/7	1/2½
Blackpool	1/7	1/7	1/7	1/7	1/7	1/7	1/7	1/2½
Bolton	1/7	1/7	1/7	1/7	1/7	1/7	1/7	1/2½
Bournemouth	1/4½	1/4½	1/4½	1/4½	1/4½	1/4½	1/4½	1/0½
Bradford	1/7	1/7	1/7	1/7	1/7	1/7	1/7	1/2½
Brentwood	1/5	1/5	1/5	1/5	1/5	1/5	1/5	1/0½
Bridgwater	1/3	1/3	1/3	1/3	1/3	1/3	1/3	0/11½
Brighton	1/4½	1/4½	1/4½	1/4½	1/4½	1/4½	1/4½	1/0½
Bristol	1/7	1/7	1/7	1/7	1/7	1/7	1/7	1/2½
Burnley	1/7	1/7	1/7	1/7	1/7	1/7	1/7	1/2½
Burton-on-Trent	1/5½	1/5½	1/5½	1/5½	1/5½	1/5½	1/5½	1/1½
Bury	1/7	1/7	1/7	1/7	1/7	1/7	1/7	1/2½
Cambridge	1/4½	1/4½	1/4½	1/4½	1/4½	1/4½	1/4½	1/0½

(For rates of wages in the Building Trade in Scotland, see page 125).

CENTRAL LANDOWNERS' ASSOCIATION AND THE RATING BILL.

THE Central Landowners' Association has issued a Memorandum relating to the Rating and Valuation Bill submitted for their consideration by the Minister of Health, and from the report published in the *Times*, January 9, it appears that the Association accepts the main principles of the Bill, but on the understanding that it is regarded as a first step towards comprehensive rating reform, which shall review the relations between local and Imperial taxation, and it urges the Government to make some authoritative pronouncement on the lines upon which they propose to deal with this further and most urgent problem as soon as possible after the Bill has passed. The abolition of parochial rating is approved, but doubt is expressed as to whether economy will be effected.

The Memorandum is a long one and we only intend noticing certain points: for instance, the Association regrets the proposal to continue and extend the provision for rating owners instead of occupiers in rural as well as urban districts, and urges that no expedient short of direct payment of rates can bring their weight home to the occupier and so help to secure economy in local expenditure.

This, no doubt, refers to clause 8 subclause (1) in the Bill, which makes it lawful for any rating authority by resolution to direct in the case of any hereditament to which this subclause applies that the owners shall be rated instead of occupiers and by subclause (3) the hereditaments included are "all hereditaments, not being agricultural land within the meaning of the Agricultural Rates Acts, 1896 and 1923, the rateable value of which does not exceed thirteen pounds or in respect of which a weekly rent is payable, and for the purpose of the foregoing provisions of this section the expression 'hereditament' includes in any case where parts of a building are assessed separately the parts so assessed."

There can be little doubt that the rating of owners in place of occupiers is a bad principle for more than one reason. The local electorate should have it brought home to them that local expenditure is reflected in the rates, and that lavish expenditure means high rates. If the landlord pays the rates in the first instance, not only is this fact lost sight of but the occupiers confuse rates with rent, and attribute increased rents due to high rates entirely to the landlord and consider he is making extortionate demands for rent.

As regards Part II of the Bill the Memorandum accepts the general principle underlying this part of the Bill, "viz., that in each area the aggregate cost of the various public services for which the area is responsible should be equally distributed among the ratepayers on the basis of a single uniform valuation," but as regards the centralisation of valuation areas the Memorandum suggests that in practice much will depend upon the scheme which will be "settled by the Minister." We understand this to mean the schemes to be submitted by the County Councils to the Minister for his approval under clause 11. The Association in this connection observes that the inconvenience and expense to which the ratepayer may be put who desires to object to the valuation list will depend more on the schemes as settled than upon the provisions of the Bill. As regards the proposed quinquennial revaluation which is to be adopted throughout the country on the system in operation in London, the Memorandum points out that that system has been modified by certain judicial decisions and the new Bill contains no definitions as to what may or may not be taken into consideration in revaluation so the system proposed is an intensification of the present London system.

The Association accepts the principle of gross value for rating being conclusive evidence of gross value for income tax, but whilst admitting that this must involve the participation to some extent of revenue officers in the settlement of valuation lists, deprecates the proposal that a rating authority (but not an assessment committee) may employ a person in the employ of the service of the Inland Revenue to make valuations. On this point the Memorandum states, "The Association strongly objects to this proposal, which seems to point to the State-encouraged employment by rating authorities on a large scale of officials of the valuation department of the Inland Revenue. On general public grounds they suggest that it is undesirable that such persons who are servants of the Crown should in effect be put into the position of expert witnesses. Cases would inevitably occur in practice in which in forming their opinion they consciously or unconsciously would be making use of information which had come to them in their official capacity in circumstances which would make the use of it by them a breach of confidence and they would thus be placed in a position of great difficulty. It is also inevitable that in view of past history this proposal will be regarded by a large section of the public as an attempt to bolster up a Department the original and main object for the establishment of which has disappeared."

Objection is taken in the Memorandum to the scheme for fixing deductions from gross values in respect of maintenance and the Association suggest the system authorised by the Finance Act of 1923 allowing deductions varying in percentage with the annual values of the properties should be adopted.

This point is connected with the whole question of accepting one valuation for the double purpose of rates and taxes, and the Association points out in connection with this question of deductions: "Another aspect of the matter and one which causes this question of the acceptance of the principle that gross value for rating be accepted as conclusive evidence of gross value for income tax to be closely bound up with the fixation of the maintenance deduction, is that while rates are concerned with real property only, taxes are concerned with real and personal property. For income tax purposes it is essential that the net figure upon which the tax is levied in the case of income from real property should be reduced to the same level as the net figure upon which the tax is levied in the case of personal income, *i.e.*, in order that like may be compared with like, *e.g.*, income from real property be compared with a salary."

Our readers will remember that Sir Trustram Eve, in a letter to the *Times*, November 19, noted some objections to the introduction of one assessment for both rates and taxes, and amongst these objections were first that it involved bringing the Inspector of Taxes or the Revenue Officer into the preparation of valuation lists, and secondly that the ideal aimed at by this system was wrong in itself, for "the underlying idea of Schedule A is a tax on the owner arising from the rent received, or its equivalent, from real property. The fairness or unfairness of Schedule A lists affects no one but the State and the owner. A local rate is a charge on the occupier and the annual value of the premises is by common consent taken as a token of his ability to pay for benefits received from certain expenditure of a beneficial nature to occupiers within a prescribed area, such as collection of dust, the service of water supply, disposal of sewage, education, roads, police, &c. It is most essential that for local rates occupiers of similar premises should be charged equally, and that all the annual values within that district should be fair one with another and on the same basis. In the case of Schedule A this is not necessary. There is a great difference in fact between rents and annual values. It is not possible in practice (especially in these days of extraordinary post-war values) to make a valuation list containing assessments which are fair for rates and yet conform to the practice of Inspector of Taxes or Revenue Officer for Taxes."

As regards the valuation of special properties such as railways, the Memorandum states that the principles to be applied and the formulæ to be adopted are so bound up with the consideration of the whole subject embraced by this Bill that if the scheme as regards these properties is deferred as is proposed, the Bill may be taken to have been accepted, whilst it is impossible to foresee the result of the proposals, and the Association therefore suggests that the present proposal shall be reversed and the provisions as to special properties be introduced first and passed subject to a suspensory provision that they shall not come into operation until the central authority is set up.

We have only referred to some of the points raised in this Memorandum.

A summary of the views expressed by the Association of Poor Law Unions on this Bill will be found in our issue, December 14 last.

PATENTS.*

APPLICATIONS PUBLISHED.*

205,752.—W. A. Williams and North British Rubber Co., Ltd.: Rubber paving and flooring blocks or slabs.

183,475.—J. Mugica: Method or process of asphalting by means of continuous strips of compressed reinforced asphalt.

193,006.—C. Didier: Method of protecting and rendering impermeable materials employed in construction.

192,372.—G. Lyon: Apparatus for seasoning wood.

205,848.—Williams, Gamon & Co. (Kaleyards), Ltd., and G. P. Gamon: Stay-bar fasteners for casement windows.

205,879.—J. F. Downing: Double water-trapped gullies.

205,887.—W. J. Mellersh-Jackson (W. E. Hacker): Bituminous concrete pavements.

205,932.—Wynn, Timmins & Co., Ltd., and W. F. Vanhagen: Heads of hammers, adzes and axes.

205,943.—E. M. Lawrence and G. T. Richardson: Safety plates for door or like locks.

205,970.—J. T. McNay: Reinforcements for concrete.

206,014.—G. Kelting, J. A. Webberley and J. Adams & Son, Ltd.: Door springs.

206,096.—A. Cabla: Pivoted sliding double windows.

200,094.—A. A. R. Fastborg: S-shaped hooks for holding together the roofing tiles in tiled roofs.

206,100.—J. T. Whittome: Sash windows.

206,604.—A. F. Shirreff: Load-lifting devices.

206,614.—Parker, Winder & Achurch, Ltd., and J. A. Wood: Operating devices for fanlights or other pivoted windows.

206,617.—A. D. Tipper and F. T. Taylor: Manufacture of door latches.

206,643.—W. A. Vaughan: Bricks, tiles and the like.

206,669.—M. Heymann: Metal coverings for walls and ceilings.

206,731.—J. Haag: Locks.

206,742.—R. Y. Ames and G. G. Scott: Roofing-tiles.

206,752.—A. H. Wilkes: Door springs and checks.

193,829.—F. Guy and M. L. Davey: Composition for use in the manufacture of concrete structures.

206,765.—R. Dixon: Sheet-metal buildings.

196,266.—J. C. Chevers: Metallic sheet for lining ceilings, walls, and other parts of structures.

206,173.—C. Kindstrom: Hollow building-blocks.

206,201.—A. Williams: Compositions for coating and producing texture and other decorative effects on plaster, "compo," asbestos sheeting, wood, iron and cement.

206,247.—H. A. Rimmer: Paint.

206,256.—G. D. Peters & Co., Ltd., and A. Brackenbury: Ventilators.

* All these applications are now in the stage in which opposition to the grant of Patents upon them may be made.

RIGHT OF WAY: COVENANTS TO CONSTRUCT ABANDONMENT.

IN a recent case, Swan *v.* Sinclair (*The Times*, December 21), an interesting point was raised as to a right of way. In 1871 a row of houses and shops were put up for auction in eleven lots and one of the conditions of sale was that a strip of land 15 ft. in width at the rear of the back gardens of the lots should be formed into a roadway and the conditions prescribed that each purchaser should as soon as possible contribute to form the roadway and remove that portion of the garden fences which traversed this strip of land and the original conveyances to the several purchasers provided that the several lots were subject to and had the benefit of the intended roadway and subsequent deeds expressly referred to this right. The plaintiff had acquired the freehold of lots 2 and 3 in 1911 by a conveyance which expressed that the lots had the benefit of this roadway. His father in 1873 had acquired a lease of plot 1 from an original purchaser with covenants relating to the roadway, which would expire in 1922 and in 1883 he had levelled up the garden at the rear of that plot, so that over the prescribed strip of land for the roadway it was higher than the gardens of the adjoining plots. The plaintiff had become the leaseholder of lot 1 in 1904, by assignment of this lease, and in 1919 he had levelled up the end of plots 2 and 3 to the level of lot 1 and he intended to build a garage on those two plots with an exit to a road which ran as we gather at right angles at the further side of plot 1, and he had pulled down a wall which separated lot 1 from that road for that purpose and erected gates. When the lease of plot 1 determined the defendant had acquired the freehold of plot 1 and he (the defendant) had then erected a wall across the strip of land between that plot and plot 2, thus barring access from the rear of plots 2 and 3 to the road. The plaintiff then brought this action claiming a right of way along the strip.

It was proved in the Court below that from 1871 until 1922 no step had been taken to form the roadway and the fences running across the strip had never been removed, and the Court below had held that as the roadway had never been formed and the strip of land had always been obstructed and the plaintiff and other owners had acquiesced the easement had been abandoned. Further, the Court held that the conduct of the plaintiff's father in levelling up plot 1 across the strip thus creating a drop between that plot and plot 2 was not consistent with the right claimed by the plaintiff.

The Court of Appeal by a majority affirmed this judgment, but the Master of the Rolls (Sir Ernest Pollock) dissented from the judgment. All the members of the Court seem to have relied upon an old case, Ward *v.* Ward (7 Exch. 839), from which the following passage was cited in the judgment of Lord Justice Warrington: "The presumption of abandonment cannot be made from the mere fact of non-user. There must be other circumstances in the case to raise that presumption. The right is acquired by adverse enjoyment. The non-user therefore must be the consequence of something adverse to the user."

From the fact that not only had the user of the road been rendered impossible by the continuance of obstructions existing at the date of the grant (that is, the fences and at least one brick wall) but also by the creation of a fresh obstruction in 1883 (that is, the raising of the garden at the rear of plot 1 to a higher level and the building of a retaining wall), the majority of the Court held the presumption was raised not merely that the right was in abeyance and capable of being revived, but that it had been abandoned and had ceased to exist. The Master of the Rolls is reported to have held that circumstances had induced upon all the owners a common delay, and inactivity was not sufficient to justify abandonment being presumed nor was non-interference with what was done in 1883 by the owner of plot 1 a clear indication of an intention to abandon the right, as at that time the road was not in being and therefore there could be no cessor of user.

There appears to be a lack of authority by legal decisions on the point raised in this case, and yet it is an extremely important one to purchasers of house property. The duty to make this road was a burden upon each of the lots sold at the auction and would continue so until the abandonment could be proved. Would any layman purchasing one of these houses fifty years after the original sale and finding that the road had not been made in all that period, imagine that the obligation contained in the purchase deeds still continued? If any such question did cross his mind, would he not consider the right both dead and literally buried when he found the level of the proposed roadway had been raised six feet behind one of the houses at least?

But perhaps the most extraordinary part of the case is that the defendants predecessor in title was the plaintiff's father, and he had first obstructed the strip by raising his garden in 1883, whilst the plaintiff himself had also subsequently altered the level, so far as all the other houses were concerned, by also levelling up the ground behind his two houses to this higher level, rendering the strip of land more suitable for a "switchback" than for a road.

It is satisfactory to see that the majority judgment finds this alteration in 1883 only twelve years after the original grant, a fact on which presumption of abandonment could be founded.

THE RENT ACTS: POSSESSION.

UNDER the above heading in an article in our issue for November 9 we dealt with section 5 of the Act of 1920, which has now been superseded by section 4 of the Act of 1923, with the view of showing the amendments which have been introduced, as this is one of the most important sections in the Acts. Paragraph (d) has been very drastically amended, and it was our intention to show these amendments by italicising that portion of the old paragraph which had become incorporated with the new matter, but in the passage of the article through the Press an error was made, or it had not been clearly indicated what portion should be italicised, and as this may give an erroneous impression of the amendments introduced we revert to this paragraph, showing how the matter really stands.

In the Act of 1920 this paragraph stood, "The dwelling-house is reasonably required by the landlord for occupation as a residence for himself or for any person *bona fide* residing, or to reside with him, or for some person in his whole-time employment, or in the whole-time employment of some tenant from him and (except as otherwise provided by this subsection) the Court is satisfied that alternative accommodation reasonably equivalent as regards rent and suitability in all respects is available."

The new paragraph reads as follows: "The dwelling-house is reasonably required by the landlord for occupation as a residence for himself, or for any son or daughter of his over 18 years of age, or for any person *bona fide* residing with him, or for some person engaged in his whole-time employment, or in the whole-time employment of some tenant from him, or with whom conditional on housing accommodation being provided a contract for such employment has been entered into, and (except as otherwise provided by this subsection) the Court is satisfied that alternative accommodation is available which is reasonably suitable to the means of the tenant and to the needs of the tenant and his family as regards extent, character, and proximity to place of work, and which consists either of a dwelling-house to which this Act applies, or of premises to be let as a separate dwelling on terms which will afford to the tenant security of tenure reasonably equivalent to the security afforded by this Act in the case of a dwelling-house to which this Act applies."

The paragraph was correctly set out in our former article, but the portions of the old paragraph which were retained were not correctly indicated by the italics. Now that the character of alternative accommodation has been so much amplified, those cases in which it is declared that its existence "shall not be a condition of an order or judgment on any of the grounds specified in paragraph (d)" require careful consideration, and in particular the distinction created by paragraphs iv. and v. of section 4 subsection (1) between cases where the landlord became the landlord before June 30, 1922, or where he became landlord after that date has caused some correspondence in the Press.

In the former case the paragraph says the dwelling-house must be reasonably required by the landlord as a residence for himself or for any son or daughter of his over 18 years of age, whereas in the latter case not only must the house be so reasonably required, but the Court has to be satisfied that greater hardship would be caused by refusing to grant an order or judgment than by granting it. As we pointed out in our former article, the general discretion contained in the subsection at the end of the first nine paragraphs "and the Court considers it reasonable to make such an order," applies apart from the specific question of alternative accommodation, but from a letter from one of the County Court Judges which appeared in the *Times*, November 26, it would appear that in some Courts a difficulty has been experienced in excluding the question of alternative accommodation from the general discretion, and the writer of the above letter points out that this may render nugatory the provisions of the new Act, and he gave instances of how in his opinion the discretion should be exercised.

No hard and fast rules can be laid down upon a matter of discretion for if they are too rigidly enforced they are destructive of discretion.

In the first case, where the landlord was landlord before June 30, 1922, there is no mention of the tenant, the house has only to be "reasonably required for occupation," but in the second case, where the landlord has become landlord after that date, it is to be observed the Court has to be satisfied that greater hardship would be caused by *refusing* to grant an order than by granting it.

In the first case, reasonableness in the desire of the landlord, there is not much difficulty, and the Judge, the writer of the above letter, gives some practical suggestions; but the second case presents some difficulty, for how can the Court determine which is the greater hardship without considering the question of the alternative accommodation? The hardship of refusing the order has to be greater to the landlord than the tenant, and thus the position of the two parties must be weighed, and although in considering this question alternative accommodation must not be a condition of making the order, yet in considering the position of the tenant it must form an element in the conclusion arrived at. The writer of the above letter hardly seems to us to have solved this difficult question as regards this second case.

Builders' Wages.

A decision was made on January 10 by the National Wages and Conditions Council to increase the wages of employees in the building industry on and from February 1, in accordance with the sliding-scale agreement, which provides that the rates of wages shall be adjusted half-yearly by ½d. per hour in respect of each complete average variation of not less than 5½ points in the cost of living index figure. The following resolution was passed:—"That on and from February 1 the rates of wages payable to craftsmen shall be increased by one halfpenny per hour, and that the hourly rates payable to labourers shall be not less than 75 per cent. of the craftsmen's rates, calculated to the nearest farthing."

It was also agreed to regrade a number of towns throughout the country, which will mean an increase additional to the ½d. under the sliding scale for those workers in the towns affected.

The application of the Operatives' Federation for the readjustment of the base rate, or starting-point, of the sliding scale, to give the men an automatic increase of 2d. per hour, will be considered at the next meeting of the Council.

CONTRACTS, COMPETITIONS, &c.

For some contracts still open, but not included in this List, see previous issues Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, &c., may be obtained.

BUILDING AND PAINTING.

✱JANUARY 18.—**Croydon.**—COTTAGE.—Erection of a cottage at Russell Hill Reservoir, Pampisford-road, Croydon, for the County Borough Council of Croydon. Borough Engineer, Town Hall, Croydon. Deposit £1.

JANUARY 19.—**Cheltenham.**—PAINTING.—For painting part of Municipal Offices, for the T.C. Borough Engineer, Cheltenham.

JANUARY 19.—**Ipswich.**—REPAIRS.—For repairs to school buildings, for T.C. Mr. E. T. Johns, surveyor, 8, Lower Brook-street, Ipswich.

JANUARY 19.—**Irchester.**—HOUSES.—Erection of six houses, for the Irchester Industrial and Provident Co-operative Society, Ltd. Mr. E. A. Taylor, Managing Secretary, Irchester.

JANUARY 19.—**Nelson.**—HOUSES.—Erection of 19 houses of the non-parlour type in blocks as follows:—8 blocks of two and one block of three at the Marsden Park Housing site, for the Housing Committee of the Borough of Nelson. Borough Surveyor, Town Hall, Nelson. Deposit £2 2s. for each trade specification.

JANUARY 19.—**Perth.**—HOUSES.—Erection of five tenements of dwelling-houses, comprising 52 two and three apartment houses, for the T.C. Mr. Thomas M'Laren, Burgh Surveyor, 16, Tay-street, Perth. Deposit £1.

JANUARY 19.—**Rotherham.**—HOUSES.—For erection of 50 houses on Eastdene Estate, for T.C. Mr. C. A. Broadhead, Housing Architect, St. George's Hall, Rotherham. Deposit £2 2s.

JANUARY 19.—**St. Helens.**—ALTERATIONS.—For alterations and additions to Boundary road Baths, for the T.C. Mr. Arthur W. Bradley, Borough Engineer, Town Hall, St. Helens. Deposit £2.

JANUARY 19.—**Stocksbridge.**—HOUSES.—Erection of 20 houses on the Shay House-lane site, for the U.D.C. Mr. J. N. Singleton, surveyor, Stocksbridge. Deposit £2.

JANUARY 19.—**Warrington.**—SCREENS.—For supply of manual instruction wood screens to various schools, for T.C. Mr. J. Moore Murray, Secretary, Education Office, Sankey-street, Warrington.

JANUARY 21.—**Bathgate.**—HOUSES.—Erection of two groups of houses (32 three-apartment houses and 20 two-apartment houses), for the T.C. Mr. Will. Allan, Town Clerk, Town Clerk's Office, Bathgate.

JANUARY 21.—**Bury St. Edmunds.**—HOUSES.—Erection of four houses in Mustow-street, for the T.C. Mr. Roland H. Beaumont, Borough Surveyor, Town Hall, Bury St. Edmunds. Deposit £2 2s.

JANUARY 21.—**Fermoy.**—HOUSES.—Erection of 8 dwellings, for the U.D.C. Clerk, Fermoy.

JANUARY 21.—**Hastings.**—STEEL CONSTRUCTIONAL BUILDINGS, &c.—Steel constructional buildings, steel plate coal bunkers and chutes, reinforced concrete pond and plant foundations required for the Electrical Department by the County Borough Council of Hastings. Borough Electrical Engineer, 20, South-terrace, Hastings.

JANUARY 21.—**Mallaranny, Ireland.**—REPAIRS.—For repairs, &c., at Mallaranny Hotel, co. Mayo, for the Midland Great Western of Ireland Co. Sec., Broadstone Station, Dublin.

JANUARY 21.—**Reigate.**—NEW LAUNDRY AND EXTENSION OF BOILER HOUSE.—Erection of a new laundry and extension of the boiler house at the Guardians' Institution, Earlswood, for the Reigate B.G. Mr. O. J. Porter, F.S.I., 45, Bedford-row, W.C. 1. Deposit £2 2s.

JANUARY 21.—**Southend-on-Sea.**—HOUSES.—Erection and completion of 66 houses, comprising 26 parlour type and 40 non-parlour type, in the following blocks:—One block of 2 houses, 1 block of 3 houses, 6 blocks of 4 houses, 5 blocks of 6 houses, 1 block of 7 houses, for the Corporation of Southend-on-Sea. Mr. Robert H. Dyer, Borough Engineer, Municipal Building, Southend-on-Sea. Deposit £2.

JANUARY 21.—**Truro.**—RECONSTRUCTION.—For the reconstruction of the Royal Printeries and alterations to shop front, &c., at Truro, for Mr. Oscar Blackford. Messrs. Cowell, Drewett, & Wheatly, architects, 11, Princes-street, Truro. Deposit £2 2s.

JANUARY 22.—**Acton.**—ALTERATIONS.—For alterations and additions to hut at cemetery, Willesden-lane, for T.C. Borough Surveyor, Municipal Offices, Acton, W.3.

JANUARY 22.—**Bute.**—HOUSES.—(1) Erection of house on Kerrycrusach Farm, County of Bute, 2¼ miles from Rothesay, and (2) house on Goltans Farm, 2 miles from Rothesay. Chief Surveyor, Board of Agriculture for Scotland, Edinburgh. Deposit £1 1s.

JANUARY 22.—**Edinburgh.**—LAIRAGES, &C.—(1) Lairages for imported cattle at the Cattle Markets, Gorgie, and (2) bench walls opposite North-West Section of Greyfriars' Churchyard, for the T.C. City Architect, Public Works Office, City Chambers, Edinburgh.

JANUARY 22.—**Edmonton.**—FLOORING.—For flooring over the first-class swimming-bath, in the Public Baths, Knight's-lane, for the U.D.C. Mr. Cuthbert Brown, Engineer, Town Hall, Edmonton, N.9.

JANUARY 22.—**Fowey.**—BUNGALOW.—Erection of a bungalow at Lankelly-road, Fowey, for Capt. Fred Collins. Mr. W. T. H. Northcote, surveyor, Fowey.

JANUARY 22.—**Glamorganshire.**—VARIOUS WORKS.—(1) Tynyrheol School (Llangeinor, Garw Valley), additional classrooms; (2) Pontlottyn Boys' Council School, minor alterations; (3) Port Talbot Secondary School, new science block; (4) Tonna Council School, conversion of offices and drainage; (5) Llangyfelach Council School, repairs. Mr. Henry D. Rowland, Assistant Secretary of Education Committee, Glamorgan County Hall, Cardiff.

JANUARY 22.—**Kilkeel, Ireland.**—HOSPITAL.—Erection of district hospital for Commissioner of Union. Mr. S. C. Hunter, quantity surveyor, 2, Wellington-place, Belfast. Deposit £2 2s.

JANUARY 22.—**Liverpool.**—SCHOOL.—Erection of new elementary school in New Hall-lane, Clubmoor, for the T.C. Land Steward and Surveyor (Architectural Dept.), Municipal Buildings, Liverpool. Deposit £2 2s.

JANUARY 22.—**Mile End.**—ALTERATIONS, &C.—For alterations and redecorations to the District Medical Officers' quarters at the Institution at Bancroft-road, E., of the Board of Guardians. Mr. Edmund J. Harrison, Lic.R.I.B.A., 23, Berkeley-road, Crouch End, N.8. Deposit £2.

JANUARY 22.—**Southall-Norwood.**—HOSPITAL, CUBICLE BLOCK, STABLES, COTTAGES.—(*a*) The erection of an eight-bed cubicle block at the Sanatorium, North-road, Southall; (*b*) the erection of a depot, stables and cottages at Adelaide Dock, Endsleigh-road, Southall, for the Southall-Norwood Urban District Council. Mr. J. B. Thomson, Assoc. M.Inst.C.E., &c., Engineer and Surveyor to the Council, Town Hall, Southall, at my office, between 10 and 4 p.m. (Saturdays 10 and noon).

JANUARY 23.—**Bath.**—HOUSES.—For the erection of 50 houses at Englishcombe Park, for the T.C. Mr. A. J. Taylor, architect, 18, New Bond-street, Bath. Deposit £1 1s.

✱JANUARY 23.—**Birmingham.**—HOUSES.—Erection of 287 non-parlour-type houses, and 134 parlour-type houses on the Brookvale Estate, Witton, under five contracts, Nos. 150, 151, 152, 153, and 154, for the Public Works and Town-Planning Committee of the City of Birmingham. Mr. Herbert H. Humphries, M.Inst.C.E., City Engineer and Surveyor and Executive Officer for Housing Schemes. The Council House, Birmingham. Deposit £2 2s.

JANUARY 23.—**Blackpool.**—CONVERSION.—For the conversion of the existing buildings in the Rigby-road Highway Depot into a laundry, for the T.C. Mr. Francis Wood, Borough Engineer, Town Hall-street, Blackpool. Deposit £2.

JANUARY 23.—**Bradford.**—WAREHOUSE.—For the enlargement of a warehouse in Canal-road, Bradford. Messrs. T. H. & F. Healey, architects, 42, Tyrrel-street, Bradford.

JANUARY 23.—**East Elloe.**—COTTAGES.—For the erection of 5 pairs of cottages in Whaplode Village, 4 pairs in Gedney Fen (Bells Bridge), and 2 pairs in Sutton St. James (Birds Drove), for the R.D.C. Mr. S. S. Mossop, Jun., Clerk, West End, Holbeach.

JANUARY 23.—**Hackney.**—PAINTING.—For painting exterior public baths, Lower Clapton-road, for the B.C. Mr. Norman Scorgie, Borough Engineer, Town Hall, Hackney, E. 8. Deposit £1 1s.

JANUARY 23.—**Manchester.**—ALTERATIONS.—For alterations at No. 31, Piccadilly, for the G.W.R. Co. District Goods Manager, 51, King-street.

JANUARY 23.—**Rochdale.**—HOUSES.—Erection of 50 houses on the Turf Hill Estate, for the T.C. Mr. S. H. Morgan, Borough Surveyor, Town Hall, Rochdale. Deposit £1 1s.

JANUARY 23.—**Tanderagee.**—COTTAGES.—Erection of four cottages in Tanderagee, Co. Armagh, for the Government of Northern Ireland. Secretary, Ministry of Finance, 15, Donegall-square West, Belfast. Deposit £1.

JANUARY 23.—**Worthing.**—FLATS.—For erection of (1) pair of flats in Charlecote-road: (2) an attendant's cabin in Denton-gardens, for the T.C. Borough Surveyor, Worthing.

JANUARY 23.—**Worthing.**—PAVILION.—Erection of a sports pavilion at Beach House Park, Worthing, for the Borough Council. Borough Surveyor, Municipal Offices, Worthing. Deposit £1 1s.

JANUARY 24.—**Camberwell.**—FLOORS.—For taking up and relaying sectional wood flooring, including platforms, barriers, joists, cradles, sills, &c., over the Swimming Baths at the various Public Baths of the B.C. Mr. William Bell, Borough Engineer, Town Hall, Camberwell, S.E.5.

JANUARY 24.—**Caterham.**—HOUSES.—Erection of 14 cottages on Queen's Park Housing Site, for the U.D.C. Surveyor, Council Offices, Caterham Valley. Deposit £1 1s.

JANUARY 24.—**Glasgow.**—PAINTING.—For (1) painter work; and (2) iron railings and gates, at Coplawhill Housing Scheme, for the T.C. Mr. J. Lindsay, Town Clerk, City Chambers, Glasgow.

JANUARY 24.—**Liverpool.**—TENEMENT DWELLINGS.—Erection of six tenement dwellings on the St. Augustine-street frontage of the Blenheim-street site, for the Housing Committee of the City of Liverpool. Director of Housing, Municipal Buildings, Dale-street, Liverpool. Deposit £2 2s.

✱JANUARY 24.—**London, E.**—ALTERATIONS AND REDECORATIONS.—Alterations and redecorations to the District Medical Officer's quarters at the Institution at Bancroft-road, E., for the Guardians of the Poor of the hamlet of Mile End Old Town. Mr. Edmund J. Harrison, Guardians' Architect, 23, Berkeley-road, Crouch End, N. 8 (from the 14th inst. up to the 22nd inst.). Deposit £2.

✱JANUARY 24.—**London, S.W.2.**—REPAIRS AND DECORATIONS.—Repairs and decorations to the Librarian's residence at the Tate (South Lambeth) Library, South Lambeth-road, S.W. 8, for the Metropolitan Borough Council of Lambeth. Mr. Osmond Cattlin, Borough Engineer, Town Hall, Brixton-hill, S.W. 2.

JANUARY 24.—**Ystradgynlais.**—HOUSE.—For erection of dwelling-house at Ystradgynlais (Glam). Mr. T. W. Thomas, 4, Canolrhiw Villas, Brecon-road, Ystradgynlais.

JANUARY 25.—**Liverpool.**—ALTERATIONS.—For alterations and additions to the Old Welsh Chapel, Crosshall-street, for the T.C. Land Steward and Surveyor (Architectural Dept.), Municipal Buildings, Liverpool. Deposit £2 2s.

BUILDING TRADE WAGES IN SCOTLAND.*

THE following are the present rates of wages in the building trade in the principal towns of Scotland. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

	Masons.	Brick layers.	Carpenters. Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Brick Masons' layers	Plasterers' Labourers.
Aberdeen	1/7	1/8	1/7	1/8	1/7	1/7	1/4½	1/-	
Airdrie	1/7	1/7	1/7	1/8	1/7	1/7	1/6½	1/2½	
Alexandria	1/7	1/7	1/7	1/8	1/7	1/7	1/6½	1/2

Chapman: five houses and shop and house, Beechmount-avenue, for the Belfast Building Guild, Ltd.; two houses, Kincora-avenue, for T. Glover; eighteen houses, Kerrsland-drive, Kerrsland-crescent and Kerrsland-parade, for R. Hewitt; seven lock-up shops, Peter's-hill, for Frederick McKibben; eight houses, Rugby-road, for W. J. Ervine; shop and house, Templemore-avenue, for J. Gordon; shop and house, Great Victoria-street, for W. Breathwait; two houses, Park-avenue, for J. Johnston; house, Myrtlefield-park, for A. McDowell; alterations to premises, Chichester-street, for W. Brown & Sons; two houses, Ormiston-parade, for C. Dickey; five houses, Newtonwnards-road Upper, for J. Robinson; alterations to shop and store, Annadale-street, for R. Simpson.

BILLINGBOROUGH.—A new heating installation is to be installed at St. Andrew's Church, tenders for which are to be invited.

BISHOP AUCKLAND.—The U.D.C. Streets' Committee have received from the Durham County Surveyor a sketch plan showing a suggested new road in the district, at a cost of between £30,000 and £35,000, by way of Castle Chare to the Market-place. The cost to the U.D.C. will, it is thought, be between £5,000 and £7,000.

BLACKBURN.—On the recommendation of the Parks Committee, the T.C. have appointed a sub-committee to deal with the question of purchasing additional land adjoining a site at Knuzden, proposed to be bought by the Corporation, and to be used as playing fields, also to deal with the question of erecting a fence on such land. The Council approved of the sub-committee's proposal to construct an unclimbable fence and to purchase land at an estimated cost of £550, and have approved a recommendation of the Health Committee for an alteration to No. 8 and No. 9 slaughter-houses for uses as a head rate slaughter-house, at an estimated cost of £650.——Improvements are proposed by the Congregation of St. George's Presbyterian Church to the church and manse, estimated to cost about £2,000, and the funds have been provided.

BLACKPOOL.—Corporation are seeking sanction to commence building immediately 100 new houses on the Watson's-lane estate. Mr. E. D. Dennis is the architect.

BOLTON-ON-DEARNE.—The U.D.C. received sanction from the Ministry of Health for the erection of 20 more houses. These will be built in Barnburgh-lane and form part of a larger scheme.

BRADFORD.—Plans have been prepared and tenders are being invited for the reconstruction and conversion of premises in Hammerton-street, for the "Shell" Oil Syndicate. Included in the scheme is the construction of huge petrol storage tanks.

BRAMPTON.—Plans passed by R.D.C.: Four semi-detached bungalows at Faugh, for Granham & Son, Fenton.

BROMLEY.—Plans passed by R.D.C.: Mr. T. Stagg, cottage at St. Winifred's-road, Cudham; Mr. H. R. Jennings, house, Holwood Park-avenue, Farnborough; Mr. H. A. Pierpoint, two pairs semi-detached houses, Tower-road, Orpington; Mr. J. E. Blencowe, house with garage, Beckenham-road, West Wickham; Mr. J. Kent, three pairs semi-detached houses, Grosvenor-road, Ladywood Estate, Orpington.

BROOKWOOD.—Surrey C.C. has authorised the expenditure of £20,237 for the improvement of the nurses' quarters at Brookwood and Nethern Mental Asylums.

BURNLEY.—The question of the erection of a new super power electricity station is under consideration, estimated to cost £300,000.

BURTON-ON-TRENT.—The M.H. has approved the erection of 48 houses by the Corporation, and the Housing Committee has decided to erect an additional 48, subject to the approval of the T.C. and the Ministry.

CARLTON (NOTTS).—Plans passed by the Council included 11 houses and 5 bungalows.

CASTLEFORD.—Plans passed: Covered way into premises at the back of Carlton-street, for Messrs. Smith Bros.; nine houses in Smawthorne-lane, for Mr. L. J. Gallagher.

CASTLE WARD.—The M.H. have given sanction to the R.D.C. for the erection by private enterprise of 15 houses, by means of lump sum grants; and also approve of the Council's proposal to erect 15 houses at Dinnington and six at Ponteland, under the Housing Act.

CHICHESTER.—The West Sussex E.C. has approved an expenditure of £750 for the improvement of the heating arrangements at the High School for Girls.

CLOWNE.—The R.D.C. has approved plans of a public hall and institute which the Whitwell Miners' Welfare Committee propose erecting at Hangar Hill.

CONSETT.—The U.D.C. have approved plans for the erection of 285 houses by the Consett Iron Co., Ltd., in the Knitsley-lane neighbourhood.

COUNDON.—Sanction has been given by the M.H. for a loan asked for by the Bishop Auckland R.D.C. for the purpose of erecting houses at Coundon; and £648 for sewerage work in connection with these.

DARLINGTON.—Plans passed by T.C.: A. Chilton, bungalow and shop, Coniscliffe-road; W. W. Lee & Son, house, Woodland-road; F. Jackson, house, Linden-avenue; Bussey & Armstrong, eight houses, Haughton-road.

DARWEN.—The Corporation propose to submit to the M.H. for their approval plans for the erection of four cottages.

DERBY.—Mr. J. C. Dawes has held an inquiry in respect of an application by the T.C. to borrow £6,800 for a motor garage at the Ford-street Depot.

DUBLIN.—Plans passed: Additions to the Skin and Cancer Hospital, Hume-street, for the Hospital Governors; cooperage stores on Jones'-road, for the Dublin Distillery Co., Ltd.; extension of Boys' National School East-wall, for the Very Rev. Canon J. Brady, P.P.; reconstruction of premises, 24, Poole-street, for Messrs. Rogan & Co.

DURHAM.—The R.D.C. has approved of the proposal of Dorman, Long & Co. to build 50 houses at Bowburn.

EDINBURGH.—Warrants granted by Dean of Guild Court: Andrew Walker Bell, double house at Grant-avenue, Colinton; G. Dickson, convert self-contained house at Ferry-road, Leith, into four separate houses, and garages; Thomas S. Henderson, four bungalows off Hillview-terrace, Blackhall; Simon Keppie, jun., villa and garage at Lasswade-road; D. M. Duncan, 16 self-contained houses at Glebe-road, Corstorphine.

ESHER.—The U.D.C. has decided to erect 48 cottages.

FEATHERSTONE.—Plans passed by U.D.C.: Eight houses at Burston, for Mr. W. Sawyer, and Mistal at Loscoe Grange Farm, for Messrs. Hy. Briggs, Son & Co., Ltd.

GARSTANG.—The Highways Committee of the R.C. have under consideration the proposed improvements to Carr Bridge Stalmine estimated to cost £5,000.

GATESHEAD.—The T.C. have adopted a proposal of its Housing Committee to erect a further 100 houses.

GLASGOW.—The Clyde Trustees have obtained Government assistance for the provision of a new £2,000,000 dock for Glasgow.—Linings granted by Dean of Guild Court: William Cook, jun., 1,010 Pollokshaws-road, Crossmyloof, two double villas in Herries-road, Maxwell Park; Trustees of Shettleston and District Miners' Welfare Society, institute hall and offices in Amulree-street, Shettleston; Houston & Young, builders, Cochrane-street, Barrhead, double villa at Merrylee-road, Newlands; Duncan Campbell, 25, Mossgiel-road, Newlands, picture house at Paisley-road, at Halfway and corner of Elizabeth-drive, Mosspark. ——New ground is to be broken in a projected building scheme, which has been prepared by Messrs. J. A. Mactaggart & Co., Ltd., building contractors, Glasgow, under which it is proposed to erect a number of five-apartment houses on ground at present forming part of the farm of Meikle Aikenhead, on the east of Carmunnock-road, Cathcart.

GRAYS.—The M.H. has sanctioned the erection of 50 more houses by the U.D.C.

GREASBOROUGH.—Plans prepared by Messrs. J. Simmons & Sons, Doncaster, for new sewage outfall works for the Mangham district, in place of the existing works at Greasborough, have been approved by the U.D.C.; and it has been decided to apply to the M.H. for a local inquiry to be held for a loan of £5,259 to carry out the scheme.——Plans passed: Two houses, Potter's-hill, for J. W. & E. Binns.

GREENOCK.—The T.C. is considering a scheme for new slaughter-houses, estimated to cost £60,000.

GUIDE BRIDGE.—The L.N.E.R. Co. have decided to increase the Marshalling yard at Dawsnap. Work will shortly commence on 27 additional sidings at an estimated cost of £34,000.

HASWELL.—The Easington R.D.C. has granted the Northern Sabulite Co., Ltd., of Darlington, permission to erect an explosives factory at Tuthill Quarry, Haswell.

HEXHAM.—Plans passed by R.D.C.: Bungalow for Miss S. E. Melville, near Edge House Farm, Barrasford; villa for Mr. R. W. Forster, Riding Mill; villa at The Eals, Corbridge, for Mr. R. T. S. Bertram.

HEYWOOD.—Sanction has been given by the M.H. for loan of £18,750 for the construction of new water mains in Heywood, Middleton, Chadderton and Morden, and the engineers have been instructed to obtain tenders for the work.

KING'S LYNN.—Plans passed by T.C.: New premises, High-street, for Messrs. Hepworths; 14 houses, Luke-road, for Mr. J. C. Horn.

LEEDS.—Plans have been prepared and approved for the erection of a four-story warehouse in Park-square. Each floor will have an area of 3,550 super yards. Tenders for this work are about to be invited by the architects, Messrs. J. Harper Bakes & Sons, Calverley Chambers, Leeds.

LINCOLN.—The Ironstone Area Church Extension Fund decided to proceed with the building of the naves of the Ashby and Crosby Permanent Churches. Under an agreed scheme between the Corporation and the local builders 300 houses are to be erected, each party erecting half of the total number.

LITTLE LEVER.—Application has been made to the M.H. by the D.C. for sanction to borrow £4,750 for the purpose of improvements at the Ginger Fold Sewage Disposal Works, which involves increased filtering area, new detritus tanks and improved arrangements for dealing with storm water.

LIVERPOOL.—Plans passed by the Corporation (the name of the the architects is given in parenthesis): Sub-station, Carlton-street, for Corporation Electric Supply Department (Land Steward and Surveyor); six lock-up garages, Olive Vale, for A. Harrison (Barlow Davies); one house, Queen's Drive, Mossley-hill, for R. J. Jones (J. W. Jones); two houses, Bellvair-road, for Selves (Mersey Building Co.); eight houses, Avonmere-avenue, for R. L. Burns (R. Owens & Son); new shops, offices and meeting room, Islington, for The Transport and General Workers' Union (Rees & Holt); new factory, Marybone, for J. E. Hughes (Travis & Co., Ltd.); two houses and garage, Beechlane, for O. Owens (T. Wainwright & Sons); nine houses and shops, Long-lane, Garston, for David Roberts, Son, & Co. (R. Owens & Sons); 16 houses, Lanville-road, for Selves (Mossley Hill Estate, Ltd.); 22 lock-up garages, Aigburth-road, for W. Livesey (Turner & Moss); electric sub-station, Harrington-street, for Wright Crossley & Co. (Wm. Tomkinson & Sons); garage and house, Townsend-lane, for G. Linacre (Pritchard & Lewis); four houses and garages,

NEW BUILDINGS IN LONDON.

Hackney.—MISSION HALL.—A new Wesleyan Central Mission Hall and Institute are to be erected in Mare-street. The architects for the work are Messrs. Gunton & Gunton, of Finsbury House, E.C. 2.

Essex-street. — OFFICES. — Offices are being built in Essex-street, Strand, W.C. 2, for Messrs. Derlikon, Ltd., of 34, Norfolk-street. The architects for the work are Messrs. Gunton & Gunton, of Finsbury House, E.C. 2.

Cornhill.—OFFICES.—A new block of offices is now being erected for the Union Insurance Society of Canton, Ltd., at 78–80, Cornhill, E.C. The two fronts are built of granite up to the second floor, with Portland stone for four floors above, and then two further floors in the Mansard roof. The building also has a lower ground floor and basement. Messrs. Bovis, Ltd., of 43, Upper Berkeley-street, W.1, are the builders; Messrs. Somerville-Barnard are doing the steelwork; Messrs. Seigwarts, floors throughout; Messrs. Jenkins, of Torquay, marble and granite wall linings; Messrs. Crittalls, windows; Waygood, lift; Messrs. Gunton & Gunton, Finsbury House, E.C.2, are the architects for the work.

Obituary.

The death has occurred at Scarborough of Mr. Wm. Garbutt Miers, aged 77, a retired builder and contractor.

The death occurred, on January 14, of Mr. John Mauchlen, of Moorside, Fenham, Newcastle, a member of the firm of Messrs. G. H. Mauchlen, builders and contractors, of that city. He was a director of the Fenham Building Estate.

The death has taken place of Mr. Evan Matthews, builder and contractor, Aberkenfig (Glam), at the age of 78 years.

PROPOSED NEW BUILDINGS.

(*Continued from page* 129.)

Menlove-gardens, for R. J. Jones (J. W. Jones); house and garage, Harthill-road, for T. N. Thomas (E. Russell Taylor); gardener's cottage, Allerton-road, for Major Tod (Morton & Dobie); house and garden, Menlove-gardens, for J. Clarkson (J. W. Jones); 10 houses, Dudlow-lane, for Self (J. W. Jones); two houses and garages, Sinclair-drive, for T. Jones (Gray & Evans); masonic hall, Island-road, Garston, for Garston Masonic Hall Co., Ltd. (E. B. Bailey); new workshop, Jasper-street, for J. Atherton (D. J. Nixon); rebuilding premises, Eccles-street, for Vauxhall Tanning Co. (R. Routledge); 52 houses, Stanley-gardens, for W. H. Furphey (A. Meadow); conversion to flats, Willesley-terrace, for C. Porter (G. H. Ashurst); conversion to flats, Sunnyside, Princes Park, for A. Fry (Campbell & Honeyburne); 24 houses, Uttingavenue, for J. Hughes (S. A. Kelly); 50 houses, New road off, for J. Hughes (S. A. Kelly); 272 houses, Hulton's-lane and 5, New-road, adjoining, for R. Jones & Co. (T. Wainwright & Sons).

LLANELLY.—The M.H. has sanctioned a loan by the B.C. for building 60 new houses at Llanerch. The loan is £27,000.

LONDON (CHELSEA).—The New Prince's Ice Rink Co. have secured a site covering 60,000 ft. in King's-road, Chelsea, for a new ice rink, club, winter garden, and restaurant, and plans have been prepared for a £50,000 building.

LONDON (LEWISHAM).—Plans passed by B.C.: Edmonds & Beale, eight houses, Woolstone-road; E. C. Christmas, 17 garages and office, Sydenham-park; L.C.C., addition to school, Elfrida-crescent; E. King, factory, Honor Oak-road: W. Pamphilon, factory, Algernon-road; H. D. Bennett, house, 1, Avenue, Grove Park.

LYTHAM ST. ANNES.—Sketch plans for a public hall and public baths to be erected on the site of the present baths and Council offices at Lytham have been approved by the Town Council. The baths portion of the scheme is to be proceeded with at once, and the Borough Surveyor has been requested to draw up estimates, &c.

MALVERN.—Plans passed: New entrance gates to Malvern College, in Woodshear-road; new residence, adjoining Golf Club House at Malvern Common, for Mr. E. C. Mann: and new residence in St. Peter's-road, for Mr. J. Mason.

MANCHESTER.—Plans passed by the Corporation: Hardy & Co., Ltd., revised plan of steelwork to premises, Victoria-street and Gateston-street; Failsworth Golf Club, clubhouse, Moston-lane, Moston; A. Wykeham & L. Gibson, two houses, Hill lane, Blackley; H. Bradshaw, 16 houses, Hill lane, Blackley; E. Nove, details of steel roof to works, Sidney street and York street, Chorlton upon Medlock; Manchester Crematorium Authorities, addition to Manchester Crematorium, Barlow Moor road, Chorlton cum-Hardy; Walker & Homfrey, Ltd., details of reinforced concrete construction, addition to brewery, Denmark-road, Moss Side; J. Scott, 20 houses, Beaumont-road and Belgrave-road, Chorlton-cum-Hardy; M. Kanton, two shops and houses, Lloyd-street South, Withington; Mrs. M. H. Gaffrey, six houses, Wilbraham-road and Morville-road, Chorlton-cum-Hardy. ——The Housing Committee proposes to arrange for the erection of 2,000 houses by builders, under the subsidy scheme.

MELTHAM.—Plans passed by U.D.C.: Bakehouse in Etherd Fold, for Mr. H. Sykes.

MEXBOROUGH.—The allotments in Adwick-road, near the Montagu Hospital, have been acquired by a local builder for the erection of 100 houses by private enterprise. The Council having received sanction for the erection of 44, are proceeding with the erection of 33.

MOTHERWELL.—Unusual activity prevails in the building trade in the district. At the recent Dean of Guild Court plans were passed for the erection of private dwellings and cottages amounting to £12,000.

NEW ROMSEY.—Plans passed by T.C.: House, Littlestone-road, for Messrs. Lacey & Jackson, Ashford.

NEWBURN.—The U.D.C. have resolved to apply to the M.H. for permission to borrow £1,600 for the widening of Union Hall-road, Lemington.

NORTHAMPTON.—An application is being made for sanction to raise a loan of £4,313 16s. 6d. to cover the expenditure of the construction of roads on the south and east sides of Far Cotton recreation ground. The Maternity and Child Welfare Committee have decided to transform St. Giles Mission Room, Dychurch-lane, into a Maternity and Child Welfare Centre at a cost of £700. Application is being made for sanction of a loan of £2,347 5s. 5d. in respect of the construction of roads and sewers on the site of a new school at St. James' End; also a loan of £1,500 to purchase a site at Far Cotton for a new school.——Plans passed by T.C.: New isolation block, General Hospital, for Mr. F. W. Dorman.

OLDHAM.—The Trustees of the Honeywell-lane Primitive Methodist Church are proposing to erect a new church, estimated to cost £4,500 and building is to commence in the near future. Pastor the Rev. W. P. Porter. Messrs. Dixon Hill & Co., architects, Oldham, have prepared the plans. Approval has been given by the Surveyors, and Building Committee of the Corporation for the clearance of the slum area of Smethurst-street, Grosvenor-street and West-street (approximately 4¾ acres) and to erect thereon 300 dwellings. The drawing of plans for these latter would be open to competition amongst architects, to whom it is proposed to offer prizes of £100, £50, and £25. The Town Clerk is Mr. J. J. Williams.——Plans approved by the Council: Mr. J. Kemble, two houses, Sheepfoot-lane, Hollins Green; Messrs. A. Pellowe & Sons, 10 houses, Manley-road.

OSWALDTWISTLE.—The D.C. have appointed a subcommittee to go into the question of provision of new plant at the Gas Works. Plans passed by the D.C.: Miss Alice Bury, house, Stanhill-lane; Messrs. W. H. Bury & Son, Ltd., eight houses, Alice-street; Mr. W. Clegg, 6 houses, Duke-street; Mr. Milton Gregson, plan of streets, Broadfield.

PADIHAM.—The Housing Committee of Padiham U.C. have recommended the erection of 12 houses at an estimated cost of £475 per house on the Drysden site.

PATELEY BRIDGE. — Plans passed by R.D.C. Bungalow, Smelthouse-lane, for Messrs. H. P. Cooper.

PONTEFRACT.—Plans passed by T.C.: House at Townville, for the Airedale Collieries, Ltd.; fish and chip restaurant in Bondgate, for Mrs. D. Glover; house in Southgate, for the Conservative Club; house at Townville, for Mr. P. Champion; two houses in Spital Hardwick-lane, for Messrs. Howson & Clark; house in Colonel's-walk, for Mr. Bacon.——Plans passed by R.D.C.: 20 houses at Brotherton, for the Council.

POULTON.—Application is to be made to the M.H. for sanction to borrow £1.270 for the purchase of land at Lower Green for the purpose of housing.

PRESTON.—The Health Committee of the B.C. have recommended the proposed extensions to the Chestnut Sanatorium, estimated to cost £13,000, subject to the approval of the M.H. Plans for 67 houses and three bungalows have been passed by the Corporation.

ROBROYSTON COLLIERY.—Plans for the erection of 124 houses at Robroyston Colliery have been approved by the Lower Ward District Committee of Lanarkshire. The proposed houses are to be built by Messrs. John Watson, Ltd., 19, St. Vincent-place, Glasgow, and comprise one and two-story cottages. The plans provide for 100 houses of two apartments and 24 houses of three apartments, all with scullery, washhouse, bath and other modern conveniences.

ROYTON.—Plans passed by the D.C.: Extension of mill premises, for the Empire Mill, Turf-lane.

RUGELEY.—Plans passed by R.D.C.: Bungalows, New-road, for Mr. Pedley and Mrs. Stokes; two cottages Green-lane, for Mr. C. Mason; two cottages, Sandy-lane, for Mr. Smith.

RYTON.—At the last meeting of the U.D.C. Messrs. J. & W. Dixon submitted a block plan for 30 houses at Sealburns, and plans for six houses, the plans being approved.

SHOEBURYNESS.—Subject to sanction the U.D.C. will erect two cottages at the Gasworks.

SILLOTH.—With a view to encouraging private enterprise in the building of more houses, the Holme Cultram R.D.C. have decided, subject to the approval of the M.H., to offer free sites on the surplus land of their housing site at Silloth to people building houses there in conformity with the Housing Act, 1923.

SKEGNESS.—Plans passed include a rest home for the employees of Messrs. J. B. Lewis & Sons, Ltd., Nottingham, the site being at the Winthorpe end near the sea.

SOUTH LINCOLNSHIRE.—Activity in house building prevails in this area, as the following programme of the various Councils in the district shows: Spalding U.D.C. are to erect an additional 30 houses and the R.D.C. another 24 houses; East Elloe (Holbeach) R.D.C. are to erect 32 houses; Boston R.D.C. are to erect seven pairs of houses; Bourne R.D.C. are also to erect further houses.

STOURPORT.—Plans passed: Thirteen houses in Kidderminster-road and Warwick-street, for Mr. Shepherd.

STRETFORD.—Plans passed by U.D.C.: 14 houses, Derbyshire-lane West, &c., for Mr. Thomas Pollock.

THORNE.—At a meeting of the R.D.C. the approval of the M.H. was received for the erection of 400 houses in the district by private enterprise, such houses to be eligible for the subsidy of £75 per house. The question of the erection of houses by the Council under the provisions of the Housing Act, 1923, was considered, and it was decided to submit a scheme, comprising 48 houses to be built at Thorne.

THURNSCOE.—The M.H. has inquired into the application of the U.D.C. to borrow £11,700 for extensions to the water undertaking.

TIVERDALE.—The Upper Stour Valley Main Sewerage Board has passed plans for the improvement of the outfall works at Tividale at an estimated cost of over £5,000.

TRURO.—Plans for the erection of twenty houses at Newham, Truro, have been prepared, and the City Council is making application to the M.H. for sanction to start building forthwith.

WALLSEND.—The Housing and Town-Planning Committee report that they have secured the approval of the M.H. to the proposals of the T.C. in regard to affording financial assistance to private enterprise in the erection of houses to the number of 200, which are likely to be commenced prior to March 31.——The T.C. have agreed to offer a price not exceeding £350 per acre for the acquisition of the golf course for a housing site.

WELLINGBOROUGH.—The U.D.C. has passed plans for a bungalow in Leys-road, two houses in Gisburne-road, two houses in Robert-street, and 12 houses on the Swanspool estate.

YEADON.—The U.D.C. is acquiring the Henshaw-lane housing site, which will allow of the erection of 51 houses.

FIRES.

DORKING.—The Dorking Electric Laundry has been almost completely destroyed by fire.

HORNSEY.—The church of St. Augustine, facing Archway-road, Hornsey, at the corner of Langdon Park-road, has been destroyed by fire.

SUNDERLAND.—Considerable damage has been caused by fire to the tallow factory at Dunning-street, owned by Mr. W. D. Humphries

Town Planning.

The Town Clerk, Manchester, informs us that a book containing all the proceedings of the Town Planning Conference recently held at Manchester has been issued, and can be obtained from him on the payment of 8s. 6d., post free in England.

* These prices apply to *new buildings only*. They cover superintendence by foreman and carry a profit of 10% on the prime cost without establishment charges. A percentage of 1½ should be added for Employers' Liability and National Health and Unemployment Acts and from 1s. 6d. per £100 for Fire Insurance. The whole of the information given on this page is copyright.

TRADE NEWS.

On the occasion of the formation of the new ompany, at the beginning of this year, Messrs. . McNeill & Co., Ltd., send us a few interesting articulars of their past activities. They were he original patentees and manufacturers in 833 of the felts known as tarred felts, and nder this designation are included asphaltic oofing, sarking, black sheathing felt, inodorous elt (Nos. 1 & 2), brown sheathing felt, and hoemakers' felts. The original trade mark is the Lion," and their felts are well-known by the dvertisement of "Lion" brand. They also nanufacture Slagbestos, which is the trade nark under which they now sell McNeill's patent lag wool "Lion" brand, which is the finest on-conducting material in existence.

It is interesting to note that their asphaltic oofing was used for covering the huts, hospitals, c., during the Crimea War. By special com-nand of Her late Majesty, Queen Victoria, the avilion at Aldershot was entirely covered by Messrs. F. McNeill & Co., Ltd., who were also he sole contractors for roofing the Great Inter-national Exhibition building of 1862. In later lays, millions of yards of roofing have been upplied to the devastated regions after the arthquake in Messina and the recent calamity n Japan; as well as for the covering of huts, ospitals, canteens, &c., during the Great War 1914–1918).

Messrs. MacAndrews & Forbes, Ltd., the proprietors of the well-known wall-board, 'Fiberlic," are removing from 65, South Molton-street to larger and more central and convenient offices at Bush House, Aldwych, W.C. 2.

We have received from Messrs. The "Woco." Door Co. an illustrated catalogue. It shows, in a very convincing manner, the quality of the wood used for Columbian pine doors.

The certificate of the Incorporated Institute of Hygiene has been awarded to the Fairfield Paint Co., of the London Colour Works, Mile End, E., stating that the Fairfield Washable Distemper has been passed by the examining Board as fulfilling the Standard of Hygiene Merit required by them.

We have received from Messrs. George Wright (Rotherham), Ltd., a copy of their stainless steel booklet. It is the first of its kind entirely devoted to stainless steel goods other than cutlery.

A new list has been issued by the Birnwell Iron Co., Ltd., of 1, Regent-street, S.W. 1, describing and illustrating the "Birnwell" hot-water boiler and stove, which from one fire provides a constant hot-water supply, warms the house, and provides ample facilities for cooking. This boiler and stove embodies many improvements and special features, making for economy in fuel and saving in labour, and has the additional advantage that it will burn smokeless fuel and house refuse.

The Midland Joinery Works, Ltd., inform us that negotiations have now been completed for the purchase of the softwood section of Messrs. Charles Perks & Sons, Ltd., Lichfield-street, Burton-on-Trent, with the extensive plant, buildings, &c. Additional plant, buildings and offices are now being erected, upon completion of which the registered office of the company will be transferred from Shobnall-road to Lichfield-street; the Shobnall-road premises being retained as a branch works. Messrs. Charles Perks & Sons are continuing the Oak Stave branch of their business from their present offices, as heretofore.

We have received from Messrs. The Midland Joinery Works, Ltd., a schedule of prices of joinery timber mouldings. It will be sent post free on the receipt of 6d.

We are informed by Mr. H. Johnston Thomas, builders' merchant, 11, Duke-street, London Bridge, S.E. 1, that he has now arranged for additional telephone facilities, and his new numbers are Hop 6550 and 6551.

TENDERS.

Communications for insertion under this heading should be addressed to "The Editor," and must reach him not later than Tuesday evening.
* Denotes *accepted*. † Denotes *provisionally accepted*.
‡ Denotes *recommended for acceptance*.
§ Denotes *accepted subject to modifications*.

VARIATIONS ON AN OLD THEME.

"Towns should be made to house a proud and intelligent race of people, and we have to see to it that they are thought of and dealt with from that point of view."—W. R. LETHABY.

WE gather from a recent meeting of advertisers that advertising is only in its infancy in this country. We are told that we are shy of advertising here; that shyness is our national characteristic and that America is far ahead of us in salesmanship. In the coming year the leading representatives of the advertising world who are attending the International Advertising Convention will be given an opportunity of seeing English life from all "angles." This ugly word is well chosen. The tendency during the last few years has been to examine every problem from an angle—the modern substitute for perspective, we suppose. Philosophy was simpler when we recognised only two sides, our own and the wrong one.

The problem of advertising is much too complicated to examine in detail, particularly from an ethical point of view; and from the architect's standpoint we are interested not so much in the amount of advertising as in the form it takes. Mr. Aldous Huxley discusses advertising from the literary point of view. As a form of literature he prefers to speak of it as "applied literature" for the sake of those who still believe in the "romantic superiority of the pure, the disinterested, over the immediately useful." "No one should be allowed," he says, "to talk about the *mot juste* or the polishing of style who has not tried his hand at writing an advertisement of something which the public does not want, but which it must be persuaded into buying." Without going into the matter in detail it is evident there is ample room for further discussion upon the relationship of commercial values to their architectural expressions.

The architectural mind immediately begins to think of advertising in relation to buildings. Huge gilt signs by day and twinkling sky-signs by night, have reduced the architect to a state in which he begins to wonder whether his building is to become merely a background for advertisements. It cannot be said truthfully that some of the older buildings suffer very much architecturally at the hands of the sign-writer, though we are fully aware of the danger of admitting an argument based upon the theory that the finer the architecture the more it will suffer from the advertiser. It is possible to contend that advertisements make an ugly building more hideous. The thought is painful we admit, but it is certain that if the given problem for the architect were to design a building as a background for advertisements the results would not be so disturbing as those we have to tolerate now. The other alternative is that the building shall be vested with architectural dignity and individuality, that the happy owner will appreciate it so much that he will consider his building to be sufficient advertisement in itself.

Already we can hear the murmuring protests of those who believe that fine architecture is to be traduced for advertising purposes. Many architects feel that importance is being given to utilitarian buildings, which is not wholly in keeping with the case. This may or may not be sound architectural philosophy, and the public, at least, could claim to see some clear-cut definition of what architects do approve. We have discussed this question several times, and here we can leave it, in the hope that a better understanding will come as the years go on. In the march of civilisation we may lose a certain illusion, but it is a true observation which says that we seldom fail to find another. If it is a question of ideals, architecture most go down with its flag nailed to the mast; but if we ventured to prophesy we would say it is fairly certain it will not go down. The philosophic doubt may be there, and if architects do not reason it out the constant pressure of any social development compels them to recognise it ultimately. There is a strong feeling that architecture must be indicative of the age in which we live, and if this is true it should always produce the best results that can be obtained in the circumstances. The history of architecture is proof of this contention, and we would like to see modern architecture taking its proud position, not as a vehicle for the publicity agent, but as a structural work of art carrying its own direct appeal so unmistakably that the owner would think twice before listening to the arguments of the sales expert. We are convinced that architects would make greater headway with the public if they attempted to analyse the psychological difference lying between the client's attitude and their own. It is not a question of being interested, and neither is it a question of right or wrong. When views upon art become dogmas we have lost the corrective value of seeing realities as they are.

There are only two solutions we can see to the problem of advertising on buildings: either architects must make an eloquent plea in their buildings for the social recognition of the value of their work, or, failing this, we must lay the responsibility upon legislation to protect us and lead us to a nobler conception of civilisation. We look to the general development of education for a remedy; we educate architects and artists, then we lose our courage and fail to deal with the problems which our own day brings to us. And the answer is that as a nation we seem to be fully alive to the value of the arts as a social factor; we believe that fine buildings and fine pictures add to the nobility of life, but we seem powerless to deal with the narrow view of life which makes so much ugliness possible.

Legislation against ugliness is a quicker process, we are told, than waiting for education to raise the standard of taste and affect public opinion, but the philosopher will tell us that legislation on these lines would indicate that we had received our education. The whole problem is a direct challenge to us to think clearly on the subject, and to face the results of our thinking. Who knows? We may eventually reach the stage when we shall cease to advertise by regarding the hoarding as a public nuisance and placing it where it is least likely to be seen.

Professor Lethaby tells us that, "the faces of buildings, which are turned outwards towards the world, are obviously of interest to the public, and all citizens have a property in them. The spectator is in fact part owner." The enterprising publicity agent threatens to give this paragraph a new meaning.

NOTES.

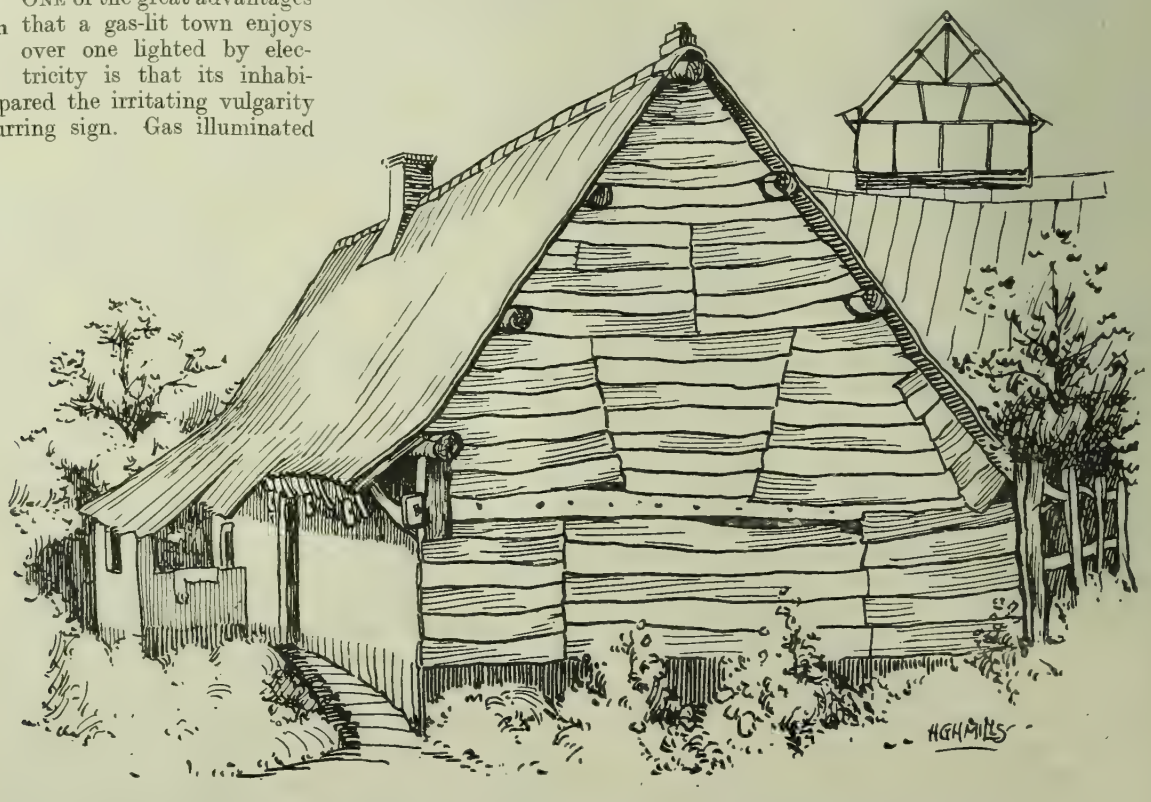
Ugly Hoardings.

When once a reform movement is set going, especially one so beneficial to communal life as the tidying up of our streets and countryside, it accelerates on itself, so that we are hardly surprised to read that the London County Council is now asking the Borough Councils to make the fullest use of their powers to secure the removal of advertisement hoardings on the roadside. All this is most satisfactory, and we may hope for a more becoming appearance in our roads and streets. But we should be wise to accompany our satisfaction at this promise of better things with a certain caution. Very few of these desirable improvements have as yet been carried out, though in course of being so, and it will require a certain doggedness of public pressure to get rid of many of the more unsightly features of advertising. If we were led to expect, as the result of what is being effected, that the matter could be allowed to rest, or that it will accomplish itself on what may be only a temporary wave of reforming zeal, we should ignore many untoward influences which remain antagonistic to change. On the other hand, we welcome the evidence of an awakening of civic pride, and a conforming of trade interests to the general welfare in response to the strongly declared expression of public opinion on the matter.

Gas Flash Signs.

One of the great advantages that a gas-lit town enjoys over one lighted by electricity is that its inhabitants are spared the irritating vulgarity of the recurring sign. Gas illuminated signs have in the past been obliged to content themselves with delivering their messages in a straightforward and permanent manner. We understand that gas is now in a position to vie with electricity in flashing at intervals, and we may well be confronted with a more universal spread of blinking lights than exists at present. Sooner or later those that employ these methods of self-assertion will find themselves forced to emulate the action of the motor spirit firms and bow to a public opinion whose patience in seeing our towns disfigured is not inexhaustible.

Landlord's Fixtures.



The limited fittings of the pre-war house are in process of revolution, and it will be interesting to see how far the movement towards elaborate fixtures spreads. Undoubtedly the initial capital outlay involved by fitted cupboards, lockers, hot-water basins, sinks and radiators adds enormously to the original purchase price, but, provided the intending occupier has little furniture of his own, the subsequent economy will repay him. In America, where the great distances militate against the familiar "removals" of this country, the elaborate fittings are an institution, but we doubt if they are coming here to quite the same extent. We all like our household goods, especially if they have family associations, and while the present movement will certainly affect the production of cheap modern furniture, people will still hesitate to part with their individual and portable possessions in exchange for what is permanent and standardised.

Panaceas.

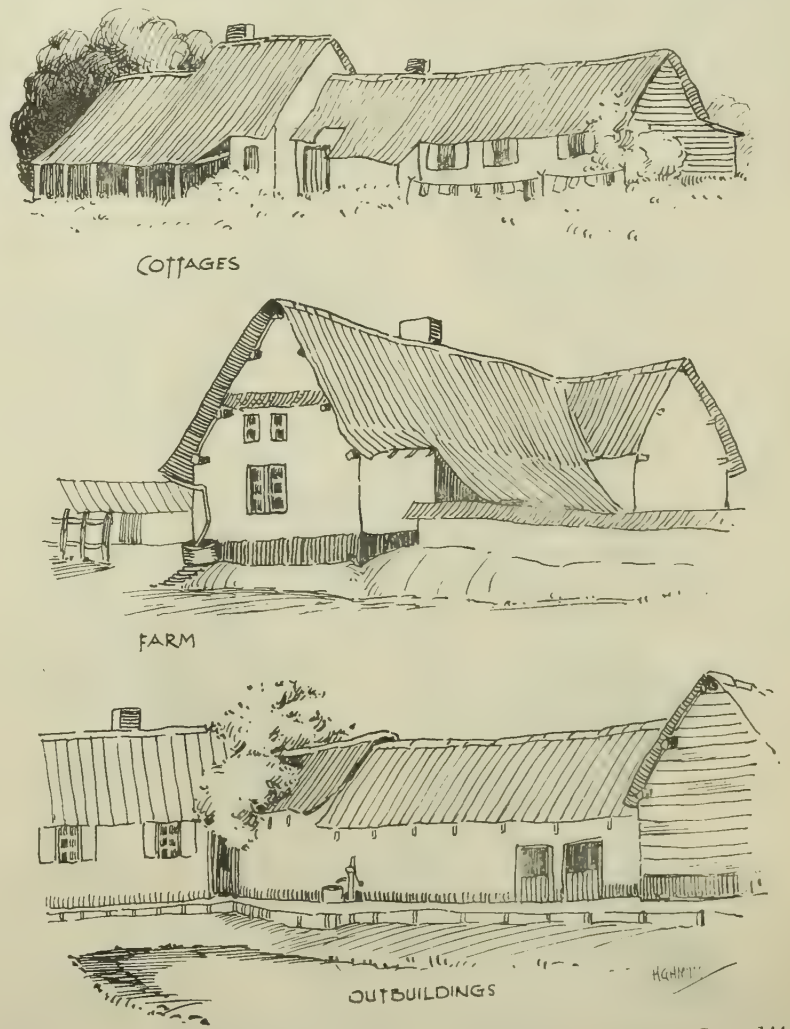
With every political crisis affecting the housing situation we have the usual crop of crank solutions; and, while any effort that emphasises the importance of the housing shortage may be of value, the assumption that there is any single panacea to solve our troubles is misleading and mischievous. Indeed, if we were at once to surmount such obstacles as trust-rings, "ca' canny," and trade-union restrictions; if we could be quit of hampering by-laws; obtain easy money, cheap land and ready transport; if we could also employ standardised construction, and ideal planning, we should still have to face a long uphill journey with no royal road to the top. Let us again repeat that nothing but hard work and general co-operation can form a basis for a policy, and that however welcome the enthusiastic amateur may be he has much to learn before he can instruct in a complex situation that has defied the ingenuity of many experts.

Rebuilding in Ireland.

From accounts in the papers it would appear that an advance has already been made to cope with the devastation caused in Dublin by the tragedies of the last few years. Apart from town-planning schemes, activities

Sketch in Northern France.—No. 3. By Mr. H. G. H. Mills. (*See p.* 144.)

An example of French-Canadian Domestic Architecture. (*See p.* 142).



have begun to replace shops, hotels, and public buildings in Dublin and Cork, but it would be interesting to learn how far the reconstruction has spread to private buildings. It is natural that delays in fixing and obtaining awards should have kept things back, and owners of country mansions are naturally not in a hurry to re-erect their homes until an assured peaceful prospect is in sight. Given settled conditions we hope that restoration and rebuilding, even of a partial nature, may be undertaken and that the peculiar quality of the fine Irish country house will be maintained.

The Coke Shortage. NOTHING has been more baffling or discouraging to the householder who has installed a smokeless heating system dependent on a coke stove than the laconic notices which certain local gas companies have recently circulated. Briefly, these companies regret that owing to the present railway strike they cannot undertake to execute further deliveries of coke. The most effective appeal that the gas companies can make to the public is their help in overcoming the smoke plague, either directly by gas heating or indirectly by the use of the smokeless by-product of coke. It is not a sufficient excuse to claim that better and cheaper gas is obtained as the coke gets poorer and dearer; the by-product is as valuable to the community as the gas is to the company, and the companies are equally responsible for this essential supply. If the public is to submit to these periodical withholdings it will re-establish the open coal fire, the anti-smoke movement will be set back, and the gas companies will be the first to suffer.

Modern Taste. THE series of articles on the great picture galleries, which Mr. E. V. Lucas has contributed to *The Times*, is not only intensely informing, but must have a valuable reflection on our own taste. Few of us possess important original works; at the best we muster some creditable sketches, a few dearly-prized etchings, some attractive old prints (whose authenticity is probably doubtful), and apart from these we are wise if we leave our walls bare or adorn them with good reproductions. Unfortunately for the architect and the house decorator the average taste is neither wise nor fastidious, and there exists a zeal for covering wall-space that would do justice to a missionary desiring to clothe a converted cannibal. Almost every second house is desecrated with badly framed, ill-hung and ill-executed pictures, distracting both in their lack of purpose and their lack of relation to one another. The familiar defence that the owner is entitled to his own likes in his own house may be legally true, but there is an increasing sense of responsibility for artistic values which will make such efflorescence unfashionable, and as a contribution to that end Mr. Lucas's articles deserve our praise.

House Purchasing. WE noted a comment the other day in a weekly paper upon the fact that only eighteen copies of "A Guide to House Purchasers" had been sold. It was suggested that the difficulty of finding a house in these days would have assured a large sale for such a book, and that there was nothing more difficult than to determine what the public really wants. We should have thought the public has small need of a guide book on this subject; it is much more interested in trying to avoid purchasing houses. Besides, there are many other more fascinating luxuries in which we are interested. The nation is still absorbed in the fascinating game of compelling itself to build and rent houses at a loss, in the happy belief that there can be neither losses nor penalties when they are shared. Happier still is the individual who believes they are shared equally.

Early Stained Glass. THE collection of ancient stained glass at the Victoria and Albert Museum is continually being strengthened by further additions, under the appreciative direction of Mr. Bernard Rackham. This collection is already full of instruction for the student of glass, containing many delightful examples. The Swiss Minister, M. C. R. Paravicini, has now lent to the Museum seven panels of early stained glass, which are exhibited on the stairway leading from Room 131 to Room 112 on the first floor. Some of these panels are of the Salzburg School, others rare and early Swiss work.

Sketches in Northern France.—No. 1. By MR. H. G. H. MILLS. (*See p.* 144.)

GENERAL NEWS.

Professional Announcement.

Mr. James Burford, A.R.I.B.A., has opened an office for the practice of architecture at 3, Staple-inn, Holborn Bars, London, W.C. 1. Telephone, Holborn 1870.

Architect's Estate.

Mr. Ernest Flint, F.R.I.B.A., of Crouch End, and of 80, Coleman-street, E.C., architect and surveyor left estate valued at £16,700 (net personality, £16,481).

Employment in the Building Industry.

According to the current issue of the "Ministry of Labour Gazette," employment with skilled operatives during December (except painters) was fairly good in the building trade.

Hastings Music Pavilion.

The Hastings Corporation has accepted the tender of a Nottingham firm for the building of the new music pavilion on the site of the old East Sussex Hospital, at a cost of £60,930.

Incorporated Church Building Society.

At the monthly meeting of this society grants were made towards building new churches at Ashby, S. Paul, Lincs., £300; and Crosby, S. George, Lincs., £300.

Singapore Post Office.

The contract for the new post office at Singapore, valued at £500,000, has gone to Perry & Co. (Bow), Ltd. It will involve a large expenditure in the United Kingdom for reinforced work.

Obituary.

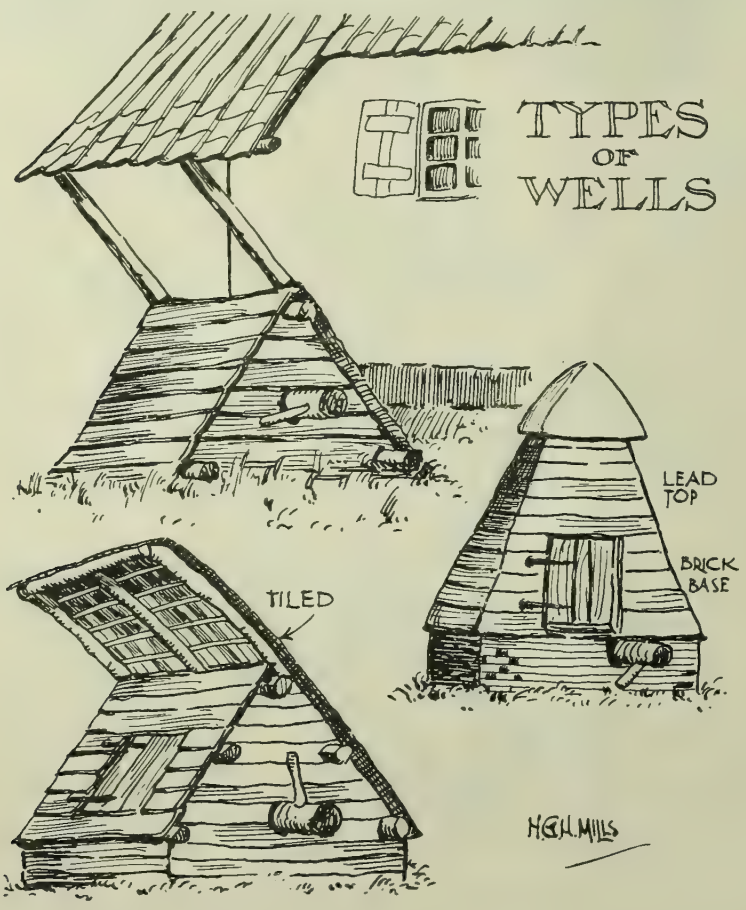
The death occurred on January 9 of Mr. Edwin Rutherford, aged 47, a well-known Durham architect. During the war he served with the Royal Engineers.

The death occurred, on January 12, at Treforest, of Mr. Frederick Gibson, architect and surveyor, Pontypridd.

Fulham Schemes.

Colonel Vaughan-Morgan, M.P., at a meeting recently convened by the Mayor of Fulham, put forward a scheme that Cheyne-walk, Chelsea Embankment, should be extended to run right through to Fulham. Another proposal was for the use of the Earl's Court Exhibition grounds, a letter being read from the freeholders of the property, the District Railway Company, stating that it was not their intention ever to use the grounds for an exhibition site. A committee was formed to devise schemes and to canvass employers in order to provide employment.

Building Surveyors' Association.



A meeting of this Association was held at Caxton Hall, Westminster, S.W.1, on January 12, for the purpose of forming a London Area Branch. The meeting was representative of members of the London District.

The chairman, Mr. W. J. Stone, M.R.S.I., read the by-laws and objects of the Association, and after a discussion it was unanimously resolved that a London Area Branch be formed. Mr. W. S. Dalton, of the L.C.C., was duly appointed chairman of the new branch, the headquarters of which will be at Caxton Hall, Westminster, S.W.1.

London County Hall.

No decision has yet been reached as to when the new wing required to complete the London County Hall is to be constructed, although work has been proceeding for some time on the foundations. The London County Hall, originally planned to cost about £1,000,000, has already cost well over £2,000,000, and the extension, which was part of the original scheme, will increase the total cost to something like three times the original estimate arrived at before the war.

The plans provided for a building with a strongly-marked centre and two wings. The south wing and the centre are complete, but the north wing is seven bays and the pavilion shorter than the south wing The original cost for the completion of the extension was considered too expensive in 1921, and the County Council is waiting for prices to come down still further.

Sketches in Northern France.—No. 4. By Mr. H. G. H. Mills.. (*See p.* 144).

COMPETITION NEWS

Raffles College, Singapore.

The assessor in this competition, Mr. John Begg, F.R.I.B.A., has made the following awards :—

First premium, No. 17, Messrs. Cyril A. Farey, A.R.I.B.A., & Graham R. Dawbarn, M.A., A.R.I.B.A., 19, Bedford-square, W.C. 1. Second and third premiums, Nos. 16 and 21 bracketed equal: No. 16, Mr. E. Vincent Harris, F.R.I.B.A., 29, St. James's-square, S.W. 1, No. 21 : Messrs. S. Woods Hill & E. C. Henriques, AA.R.I.B.A., Bombay. Hon. mention : No. 10,477, Mr. W. S. Huxley, F.R.I.B.A., 44, Great Russell-street, W.C.

Dudley Memorial.

The assessor, Mr. W. Curtis Green, A.R.A., F.R.I.B.A., has made the following awards in this competition :—

1.—(£300), No. 54, Messrs. W. Alexander Harvey, F.R.I.B.A., & H. Graham Wicks, A.R.I.B.A., 5, Bennett's-hill, Birmingham.

2.—(£200), No. 3, Messrs. Stockdale, Harrison, F.R.I.B.A., & Sons, and Geo. Nott, A.R.I.B.A., 7, St. Martin's East, Leicester.

3.—(£100), No. 6, Messrs. H. V. Ashley & Winton Newman, FF.R.I.B.A., 14, Gray's Inn-square, W.C.

Memorial Designs.

Designs are invited (they may be submitted up to September 30) for a statue in bronze, and pedestal, in honour of Sir Ross Smith, the Australian airman who, in 1919, with his brother, Sir Keith Smith, and two Australian mechanics, made an aeroplane flight from England to Australia. The memorial is intended to cost about £5,000. Conditions and full particulars may be obtained from the Agent-General for South Australia, Australia House, London.

The memorial will probably be set up in Adelaide, Sir Ross Smith's native city.

Worcester.

The Education Committee has decided to invite designs from local architects for the erection of a proposed new secondary school at the Thames House site. Final choice of assessor has not yet been made.

Newcastle Fire and Police Station.

Newcastle City Council have decided to hold a public competition amongst architects for plans for the proposed new police and fire brigade station on the Marlborough-crescent Market site. Buildings are to cover 2,465 yds., leaving the remainder for an open court yard. Exclusive of the installation of alarm system, the estimated cost is £12,500. Three prizes, amounting in all to £900, will be offered for designs, and an assessor, nominated by the President of the Royal Institute of British Architects and approved by the authority, will be appointed at a fee of £281 10s. to adjudicate. Sending-in day, March 27.

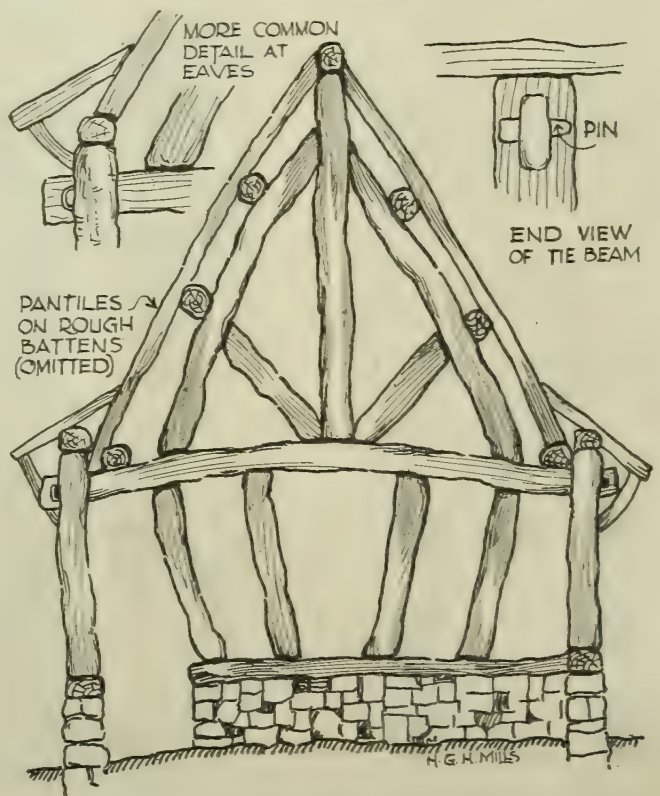
Other Competitions.

Other competitions still open include the following (the dates given are, first the sending-in date, and second the issue of *The Builder* in which full particulars were given):—Essays on Heating and Ventilating (Mar. 31; Nov. 9, 1923). Holmside Hospital (Feb. 14; Dec. 14, 1923). Industrial Designs (June; Dec. 21, 1923). National Theatre (April 26). Monument to Sir Wilfrid Laurier (April 3; Dec. 14, 1923). Belfast Union Lighting (March; Nov. 9, 1923). Dunfermline War Memorial (March 8; Dec. 28, 1923). Newcastle Concert Hall (March 1; Oct. 26, 1923).

RAFFLES COLLEGE COMPETITION.

THE drawings submitted for these Educational Buildings were on view last week at the Office of the Crown Agents for the Colonies, at Millbank, near the Palace of Parliament at Westminster. Twenty sets of plans, many of them being of extraordinary interest, were submitted to the assessor, Mr. John Begg, F.R.I.B.A., who, as Superintending Architect to the Indian Government for several years, is in every respect qualified as an expert of long experience to advise wisely in a local project of this importance. Unfortunately his award had not come to hand when the public exhibition opened; under these circumstances the preferable course in making our notes upon the designs was to follow seriatim the order of the hanging, which appeared to have been made without prescript and quite casually. Identification was out of the question, as it should be for the purpose of the competitions, although in our review critical or descriptive remarks are not easy to follow.

Commencing at the rear end of the exhibition room the first pair of designs, marked "10321" and "10311," seem to have been submitted by the same competitor, judging by their similarity of style, though they are more unlike in plan. At the outset we may briefly explain that the splendid open site is formed by the tableland on the top of a slope, giving in the main a difference of about 80 ft. drop in front. Herein was comprised an important factor in solving the problem, which consisted in accommodating such varying gradients. Naturally the diverse methods adopted by the competitors produced vastly differing lay-outs. So far as we could follow, some of the designs appeared to have ignored these contours. "10321" locates the School Block with its four internal courts in the middle of the site, the students' blocks being grouped round. A water tower facing the Science Building fronts the southern approach road. The main entrance is on the north, terraced to fit the incline. This has a refined and well-considered façade flanked by hostels, right and left. "10311" transversely disposes of the three main college buildings, and connects them with cloisters; the lecture room blocks are set on the south. In front the Administration Building comes between three hostels. Both designs show reserved taste and much study. In "10383" there are scampering roads which scatter the buildings over the site. The good squarish Assembly Hall, carried out behind the Administrative Block, is worthy of its purpose, with open verandahs, so important in the tropics. Plain and unpretentious, this design is British in idea. "10310" displays local knowledge and the value of covered ways. The airy Library is set behind the front portico which furnishes the centre piece of a capital façade ranging before the Assembly Hall. "10342" flanks his hall with the Art School and Science Department, ingeniously adapting the premises to the various gradients, while forethought situated the "native quarters" apart from the hostels and students' blocks. "10476," quite unlike the rest, adopts a capacious boulevard with the cruciform Administration block in the midst, crowding the space rather, and in front this approach is flanked by the six main buildings of the College. "10441" sends a compact lay-out made up of many quads distributed puzzle-fashion round the administrative centre piece, with a portico on each front leading to the Assembly Hall. This feature in the College will probably not be erected for some years to come; therefore a difficulty may arise when it is incorporated, as many of the designs provide, with parts not immediately essential for use when the College is started,



"No. 18" attracts us rather by placing the chief buildings across the site with the Lecture Room buildings disposed on either hand. The Principal's residence is located hard by on the left without intruding needlessly. The ornamental grounds are skilfully laid out with paths geometrically devised, though terraced contrivances to fit the falls are omitted, and no steps are shown. The professors' houses are behind, with playing fields beyond on the north. This is an inexpensive proposal, and presents a scheme with much character worthy of the occasion. The Assembly Hall could be built by itself, as it divides the two internal courts of the main school buildings. The Arts and Engineering Departments are contrived as the frontispiece worked out capably handled as a composition, devoid of pretension and architectural fussiness. "10471" hangs close by, but is of a different order with a plan too cramped for a successful college though not lacking in merit.

"No. 17," shown by nine big strainers of excellent drawings, is quite one of the most satisfactory and meritorious schemes produced for this competition by presenting a direct and practical solution simply devised on broad lines. The hostel buildings flank a great quad, and this is situate where a comparatively level area is obtainable on the little plateau above the escarpment of this Singapore site. The Assembly Hall is complete in itself and adjoins the Administrative Building. It is on an upper floor level above a throughway treated as a cortile. The Hall is admirably contrived with galleries round beyond a colonnade, supporting its segmental ceiling. An apsidal platform recess is well adapted for an organ, also having regard to acoustic efficiency. Offices and business rooms flank the ground floor entry, which leads to the secondary quadrangle in front of the big court previously mentioned. The Library is well arranged and the subsidiary buildings take their proportionate positions proficiently. Ample provision of wide eaves and facilities for good "blow through" ventilation give a sense of airiness so essential even for a hillside college at tropical Singapore. The arched verandahs leave nothing to be desired and greatly enhance the breadth of the façades which, while conforming to the essentials of native architectural comeliness, avoid mere meaningless attachments of the classical orders and entablatures. This proposal relies rather upon a tasteful massing of mural dispositions with monumental proportions adapted to vertical sunshine and Oriental environments. The scheme is comparatively inexpensive. The draughtsmanship is workmanlike and practical, care being taken to set out the falls and gradients so necessary where a site deviates continually in all directions. The perspective is excellent.

"No. 21" looks essentially British in conception, though the architectural embellishment adheres more to Hindu forms. The cupola which surmounts the great Assembly Hall furnishes a handsome composition dexterously devised and located to the hinder part of the Administrative Building, of which it forms a fine constructive finish. The long range of hostel accommodation extending N. to S. along the axial line of the site suggests the likelihood of some complications incidental to the divergence of contour in that direction should the flooring throughout be kept to one uniform level. The verandahs have shafts of Indian character emphasising their vertical lines strongly. Possibly in the sunshine of the tropics this effect might be very different from that suggested by the thick ink lines of these elevationals. The school arrangements are well thought out, and if carried into execution this design undoubtedly would present a handsome and capable college of much architectural excellence. "No. 16" develops in elongated proportions stretching along a terraced lay-out by adapting the curved continuity of the several levels on extended segmental lines. Facility of administration is thus made less easy and vast corridors are unavoidable. The author deserves credit for the ability displayed.

"10475" attaches his Library over the Administrative block to the Assembly Hall, an arrangement suggested by the conditions of the competition, but on the whole the scheme is not exactly attractive. The bulbous dome shown by "10474" may be an oblation to the Orient as marking his Assembly Hall in a recognisable style.

[Since the above was written the award has been made. The result is given on p. 138, and the first premiated design, by Mr. Cyril A. Faney and Mr. G. R. Dawbarn, is given in this issue.]

Sketch in Northern France.—No. 2.
By MR. H. G. H. MILLS. (*See p.* 144.)

CORRESPONDENCE.

A.A. Year Book and Deficit.

SIR,—The office diary now incorporated with "The Year Book of the Architectural Association" is admirably got up and well arranged, with ample space on each page for two days' entries, instead of three, also lined throughout for recording cash accounts. Owing to unfortunate delay members did not receive their copies, or at any rate I did not, till the middle of January, by which time in all likelihood many had already procured their diaries and started book-keeping. A new feature on this occasion is introduced giving miscellaneous technical data and architectural information amplified by several pages of advertisement matter. This thickening makes the volume (measuring 11 ins. by 8 ins.) rather too bulky and heavy to handle for ready reference. Its production, according to the balance sheet, cost £500, modified to some extent probably by the advertisement returns. The "Old Brown Book" was much handier if less pretentious, but its expense was nominal. Having joined the A.A. in 1872 I remember "the day of small things," and admit "being old fashioned enough" to reckon much on "making both ends meet." Consequently, perhaps, I may be forgiven for pointing out how sincerely I regret to learn from the new "Year Book" that on a total income for the session of £17,660 8s. 5d. there still remains a significant annual deficit in the neighbourhood of £700. The sessional subscriptions of 1,649 members reached £2,010 10s. 6d., and the fees from students amounted to £9,497 10s. 2d.; but how this last sum is made up, or by how many students, does not appear. The numbers should be clearly stated, particularly as the Board of Education grant stands at £1,884 10s. How much does this State aid work out per head? I hope my inquiry is not to be considered untimely, for I cannot help urging that under such favourable conditions our prosperous and popular "Alma Mater" ought to pay its way. I need not now go into the various items in the balance sheet, but possibly the overhead charges might be modified more proportionately without loss of efficiency. The rent for the three houses comes to only £475, and rates £241 13s. 4d. The executive and administrative expense, amounting to approximately half the gross receipts, occasions the discrepancy, judging by the figures tabulated in the balance sheet set out in this well-produced brochure.

Academic Dress.

SIR,—Has not the paragraph in your issue of 18th inst. been written under a misapprehension?

The meeting to which you refer, and which practically filled the available accommodation, was not called, and did not attempt, to give the Royal Institute's decision on the principles of academic dress. This had been done at the large meeting held last May and by a large majority. But it prevented the new Council's endeavour to negative that decision. In these circumstances it surely is not desirable to refer the matter to "the whole profession," especially as only the members of the Institute have any concern in the subject.

E. H. WOODCOCK, A.R.I.B.A.

"Brighter Bristol."

SIR,—I think the following is too jolly altogether to be missed by the general reader:—

Competition Question: Are the stables for mounted Police?

Answer: Accommodation required for horses only.

Evidently, in spite of the "Geddes' Axe," Bristol intends to go on pampering the public services.

"BRISTOL READER."

The Menai Suspension Bridge.

SIR,—Will you permit me to call the attention of your correspondent "H. C." to the clear width and height required for the navigation of the Straits, 550 ft. by 100 ft. (high tide minimum), respectively? He will then see the impracticability of the ferro-concrete arch.

The subject is too important to be decided by what Professor Lethaby calls "the poverty of one mind."

A. HENTHORN STOTT.

Other Letters.

[Several other letters are unavoidably held over.—ED.]

TOWERS AND SPIRES.

III.—Tower of the Church at Roulet.

By SYDNEY TOY, F.S.A., A.R.I.B.A.

AT Roulet, near Angoulême, in the Department of Charente, there is a tower built about the middle of the twelfth century, which, while retaining many of the characteristics, shows a considerable development on those already noted; and this, both in regard to principles of construction and to beauty of form (Fig. 4), the church above which it stands, in common with most of the smaller churches in the south-west of France, is an aisleless building covered by two cupolas, and the tower is built over a bay between the nave and the choir, so that two of its sides are supported by the lateral walls of the church, and two by transverse arches thrown across the building at this point. The bay destined for the support of the tower was especially strengthened, and both the lateral walls and the transverse arches are of a substantial character. The vault above, therefore, finds sufficient abutment in the thick walls by which it is enclosed, aided by the great weight of the work above. The vault itself is of octagonal form, with long and short sides, the latter being carried across the angles on squinch arches.

Above the roof of the church the tower rises in two square stages surmounted by a conical spire and open pinnacles. The first stage, which actually embraces both the vault and the lower part of the belfry, is relieved by plain blind arcades, and the belfry above is pierced on each side by twin windows of two lights. It will be observed that the spire here no longer retains the convex form, observed at St. Front, Perigueux, and at Saintes, but is of true conical form, and rises relatively to a much greater height. A platform is secured for the spire by making its internal diameter at the base greater than the internal width of the tower, so that the portions of the base which cross the angles of the tower are relatively small, and the angles are encorbelled out to support them, as shown in the section and on the plan BB (Fig. 4). The outer surface of the spire is decorated in a manner similar to that observed at St. Front, Perigueux, and at Saintes, and shown in Fig. 2 (vide second article), but that the scales here are pointed instead of being circular. The pinnacles are placed diagonally across the triangular spaces on which they stand in order that their centre of gravity might be brought nearer to that of the spire and their weight thus become more effective than would be the case if their sides were true with the sides of the tower (plan BB, Fig 4).

In design the tower at Roulet is much in advance of any of those already noted. The proportions of the stages to each other and of the tower to the spire are happy, the structure is obviously designed for the purpose of containing bells, and due importance is given to the chamber destined to contain them, the angles of the belfry are moulded, and the whole tower is tied together aesthetically by the string courses, all of which, those at the springing of the arches as well as that between the stages, are continued round the walls. The pinnacles also, while being sufficiently widespread to be effective as loads, are preserved from heavy appearance by their hollow construction. The general effect is pleasing, and graceful to a high degree. Fig. 4 shows a section, an elevation, and two plans of this tower.

The central towers built in the Rhenish provinces during the eleventh and twelfth centuries were principally of octagonal form throughout, after piercing the roof of the church above which they rise. An example of this is seen at Guebwiller, near Colmar. Here the sides of the octagon passing the angles of the crossing are carried on squinch arches, and the tower of octagonal form rises above the roof line in three stages, the first plain and the others pierced by windows, and is surmounted by a stone spire which springs directly from the walls at the top and is also octagonal. Eight pinnacles, one at each angle at the base of the spire, are formed by continuing a portion of the angle of the tower up to a point well above the base of the spire, and from this point breaking back the sides of the projection steeply towards the sides of the spire. This imparts a somewhat crown-like appearance to the upper part of the tower.

Pinnacles, or acroteria, of a similar form occur on the western tower of the church of St. Martin d'Ainay, at Lyons. This tower dates from about the same period as the tower at Guebwiller—the end of the eleventh or beginning of the twelfth century. Here, however, the tower is square, and is surmounted by a low pyramidal spire. The angles of the tower are carried above the base line of the spire, are brought to an acute point, and from this point returned back steeply to the faces of the spire, thus forming earlike triangular projections with the vertical sides in line with the angles of the tower. A more elaborate and pleasing development of these acroteria occurs on the tower of the church of Isomes, near Langres, in the Department of Haute Marne (Fig. 5). The tower dates from the second half of the twelfth century, and rises over a bay of the church similarly to that at Roulet. It is square, rises two stages above the church, and is lighted in the belfry stage by a single window of two lights on each face. The spire is octagonal, and rises rapidly from above the belfry to an acute point. At the base of the spire are four acroteria and four gables. The acroteria occupy the triangular spaces at the angles of the tower, and provide the requisite load at these points. The function of the gables is mainly aesthetic, in that they preserve the continuity round the tower of the broken line given by the acroteria, so that the bizarre effect produced by the isolation of the latter at St. Martin d'Ainay is avoided. Decorated relief is provided by columns at the angles of the acroteria, openings in the gables, and a sculptural cornice which is continued round both the acroteria and the gables. It is probable also that the triangular platforms at the summit of the acroteria were designed to accommodate seated figures of the evangelists, or allegorical subjects. As a result of these refinements, the general effect of the tower at Isomes is far more pleasing, and its character more uniform than is the case in the earlier examples of this treatment at the base of the spire. Provision is made for discharging the rainwater from the spire clear of the tower walls by means of plain gargoyles placed at the junction of the gables and acroteria.

An example of similar treatment of the angles above the squinch arches from the West of France exists at the tower of St. Radégonde, Poitiers, also dating from the twelfth century (Fig. 6). Here the acroteria occur at the base of an octagonal lantern, and surmount very heavy angle columns. Since, in this instance, they are dominated by the lantern above, are themselves of subdued proportions, and have sculptured terminals, they fulfil admirably their aesthetic rôle of breaking the awkward junction between the square at the octagon, as well as their constructive purpose of providing the requisite load at these points.

Fig. 6.—Tower of St. Radégonde, Poitiers.

Tramway Extension at Dulwich.

The London County Council's proposal to extend the tramways from West Norwood to the Crystal Palace met with a good deal of local comment. The trustees of Dulwich College, in particular, were very adverse to the scheme. On the other hand it was contended that the traffic requirements, as well as the growth of the population of the district, justified the extension. At a meeting of the Camberwell Borough Council, recently, the Finance Committee's report, that the Council do not consent to the proposed tramways, was carried.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS

A MEETING of the Royal Institute of British Architects was held at Burlington House, W.1, on Monday last.

Obituary.

The Hon. Secretary (Mr. A. Keen) announced the deaths of Mr. Arthur Clyne, elected Fellow 1901, a Past-President of the Aberdeen Society of Architects and the representative of that body on the R.I.B.A. Council, Session 1901-2; Mr. Arthur Clutton Brock, elected Hon. Associate in 1922; Mr. Charles William Reeves, elected Associate 1880.

It was decided that a message of sympathy and condolence be conveyed to the relatives.

CANADIAN ARCHITECTURE.

Mr. Percy E. Nobbs, M.A., F.R.I.B.A., read a paper, illustrated by lantern slides, on this subject. He mentioned, in the course of his paper, that it was just over twenty years since he had been privileged to attend a meeting of the Institute

It was, perhaps, not necessary to embark on a critique of the ugly to justify a claim to their gratitude for not unduly stressing their work from the third quarter of the nineteenth century.

Previous to the cession in 1763, French Canada had a well-established tradition in rouble building, with shingle, and later with sheet tin roofing. Strange to say, the French never evolved a log architecture in Canada, and their clapboard and framing was an adaptation of New England methods founded on prototypes evolved between the Thames and the Channel, where the typical English forests of oak ever gave way to pine. The French-Canadian steeples had always had distinctive character, and the earlier ones were distinguished by simplicity of composition, combined with extraordinary grace. The French window (casement, opening in) had been adhered to with a tenacity almost as great as that bestowed upon language and religion, and only of late years had its supremacy been challenged by the mullioned ranges of casements, and the sliding sash, respective heritages of the English Gothic and Classic traditions. But by far the most characteristic feature of old French building craft in Canada was the exaggerated belleast designed for shade and shelter and an essentially bad snow form. Perhaps its grace had been sufficient justification. It was dead; but it had died hard.

Just after the end of the French régime there was a school of crafts established at St. Joachim, on the north shore of the St. Lawrence, below Quebec. There, among other things, iron latches, locks and cockspurs were made with distinct signs of Gothic method—the only trace of natural, traditional, unrevived Gothic culture he knew of in America. Again, from about 1800 to 1825, one Quevillon established a School of Design and Craft at St. Vincent de Paul, near Montreal, and much of the quaint and interesting work in the way of pulpits and altar-pieces in French-Canadian churches was to be ascribed to his school, which at one time numbered about one hundred apprentices.

FRENCH-CANADIAN CHURCH NEAR QUEBEC
(Built 1750; now demolished.)

Until a century ago there were two well established traditions in Eastern Canada, with French and English origins, both curiously parallel to the contemporary work in the cities of the Baltic. The English tradition was, of course, closely allied to that of New England. The traditions, inherited from the France of the Louis and the England of the Georges, were partly ameliorated by climate and partly by the use of that greatest of all timbers, now well-nigh squandered out of existence, white pine. But the semi-indigenous traditions were no more, for to build in the good old ways has now become desperately expensive, and that part of the goodness which was craftsmanship was quite unattainable. In Halifax and St. John, Quebec, Montreal and Kingston there

CHURCH NEAR MONTREAL (Built 1787; demolished 1885).

were buildings from the design of men trained in the offices of Adams and Cockerel, who came to Canada as civil officials attached to naval and engineers' services. Their works were equal in delicacy and grace—and, he might add, in stability—to anything of the kind in England. But such treasures were in a sad way, and public interest in their preservation was as yet non-existent. A survey of the older architecture was now begun by the students of the Department of Architecture at McGill, while the Province of Quebec Association of Architects had a scholarship for travel and study of old French work. These were poor expedients when public pride was lacking.

Such things belonged to an era that had passed, and exceeded in grace and accomplishment anything done since in Canada. Here and there, up to 1860, a little work in the older manner was still occurring, but a grander scale soon supervened, bringing with it a somewhat vulgarised taste in detail. Thereafter, the most virulent phase of "American Victorianism" had a vogue. Some fine square houses were built about this time, with better detail outside than in, but the vernacular taste became wholly corrupted, and the use of galvanised iron for feigned stonework made all things possible. By 1880 people were no longer building so large; the cycle of economy in scale had set in; but prodigality in the use of pine and oak was still manifest. By 1900 rapidly-rising prices and the depletion of the supplies of the better qualities of timber had inaugurated an era of condensed planning and inferior construction. Craftsmanship disappeared.

Some time about the fifth year of this century, he had the pleasure of showing Mr. Salm, the Dutch architect, the charms of Montreal in mid-winter, and it befell that they sat us down in a then famous hostelry before a mighty jig-saw doorway, manifesting in sundry natural and grained woods, with some gilding, an inarticulate volley of broken pediments and chamfered whatnots. "Why did he make it so ugly?" asked my friend; and again and again, "But why did he make it so ugly?" And then, after a long pause, he grabbed the lecturer by the thigh in enlightenment, and chirruped, "I know! I know! *Because he could not make it any uglier!*" After that they went slumming, and he was charmed with some of the gracious and dignified simplicities of a bygone day, more particularly several buildings since demolished.

The horrors into which the Neo-Greek tradition, after a good start, degenerated in Canada laid open the way for Gothic revivalism, even in its crudest forms, as a welcome relief. This was in turn supplanted by the robust American Romanesque of Richardson during the last twenty years of the century, only to be superseded by a second phase of Gothic, which looked to Mr. Goodhue, rather than the Tudor originals, for inspiration. Their mediævalism was thus seen to be both artificial and exotic in its inspiration. It had been most successful when least scholarly, as in the case of the choir in St. Patrick's Church, Montreal, in which material and climatic considerations joined with a vaguely felt tradition to embody a noble scale and sensitive proportions.

Office buildings were a highly specialised line in what used to be listed as "Yankee notions," and many thoroughly effective examples had been built in Canada both by American architects and Canadians. So also with the institutional work and collegiate buildings, the American models had, for the most part, been followed, with their good and bad points evenly accentuated.

Now, the outstanding curse of life, and therefore of art, on the American continent was standardisation. This vitiated everything from the plans of pantries to the outlook on foreign affairs, and carried with it a vast momentum of inertia. So, one town became like another throughout the States of the Union and, by an infection which there was no possibility of avoiding and no use in denying, throughout the provinces of Canada as well. The older towns still had the bouquet and savour of individuality. Halifax and St. John retained their rugged silhouettes on ridge and crag; Quebec, her discreet fronts on narrow and precipitous lanes, with dainty spires wherever a church might cling upon her slopes; Three Rivers, her ancient memories in stone; Montreal, the disordered picturesqueness of a lingering eighteenth-century civilisation at odds with modern commercialism; Kingston, her forts and her Palladian façades; and London (in the bush) her shaded avenues of elms.

Toronto, till the other day, possessed an element, if not of the picturesque, at least of the intimately reminiscent, that brought to mind the flavour of old English towns. Then that was taken away, as they knew; it was the public-houses redolent of the "putty, brass and paint" of old England.

The smaller towns of Ontario still retained a certain charm due to a not over-accelerated development. But the cities of Ontario, and the cities and towns of the plains, were American, with certain very American standard features such as useless but elegantly designed columnar porticoes to the banks, and useless and ill-designed Gothic towers upon the churches; and, where educational institutions of any importance occurred, a display of collegiate stage-setting, mullions and buttresses, and parapets all turned out by the acre, with a singular lack of all that Mr. Prior would understand as of the Gothic spirit. Now, in the Eastern States of the Union, the demure and legitimate classic inherited as a real tradition from Georgian times was able to achieve solutions for all manner of collegiate problems.

Materials throughout Canada varied about as much as they did in the similar range of distance from London to Moscow. Of lumber the best went abroad, White pine had been wantonly exhausted. British Columbia fir was now used even in Nova Scotia. Except birch and maple for flooring, all good hardwood came from the United States. Barring the West, all lumber was now inferior or expensive, or both, a striking

A French-Canadian Cottage.

example of exploited natural resources. In Alberta there were superb brickfields, whose product matched the best in the United States—that was in the world—but the brickfields of the chief centres of population yielded sound material, uninteresting in texture and colour. Most first-class face brickwork in Canada was done with American bricks. The situation as to stone was similar. Most stone used came from the States. Nova Scotia, Quebec, Ontario and British Columbia had granite, and some of the plants were as highly developed as any in the world. The grey limestones of the St. Lawrence Valley, Kingston, Montreal, and Quebec were unsurpassable as a dignified material, but they were costly to work compared to the softer sandstones and limestones from the States. The olive sandstones of Alberta and New Brunswick are sad in tone and not really comparable with the grey limestone or American sandstone for weathering quality. Winnipeg had a pale limestone with a strong shell mark admirably suited to large scale work; this found its way as far east as Montreal and as far west as Edmonton. Material had thus but little local significance in Canada. In many cases, whole streets of buildings had involved transport in the raw over five hundred miles and more, from half a dozen directions.

Now, as to the culture which found a general expression in Canadian architecture through the co-operation of the lay and professional minds, there was, of course, that easy generalisation to fall back upon about Canada as an interpreter of Britain to America, and America to Britain. For this view there was some superficial corroboration in the fact that to English eyes Canadian architecture was very American, while to American eyes it often appeared a little English. But all travellers were predisposed to react to the unfamiliar.

Strenuous efforts were made from time to time in magazine articles, novels, histories and caricatures to elaborate a Canadian type—so far without success, for the all-sufficient reason that there were many types, all abundantly characteristic, and much water would pass down the Great Lakes before there was assimilation. The best rooted elements of society in the Maritimes, in Quebec, in Ontario, on the plains, and on the coast, were all distinctive, and long would they remain so. Current Canadian architecture, however, did not reflect these distinctions at all. An understanding of the constituent elements of the architectural profession in Canada was necessary to explain this.

A word upon the building trades in Canada. They were not as highly unionised as in England, but unionisation was an international affair in the United States and Canada. The effect of this was complicated by the racial apportionment of the several labours of building in a district, and the prevalence of racially homogeneous gangs for different work on a job. Apprenticeship was practically non-existent. The trade schools had so far failed of their purpose. As a result the skilled trades were recruited by immigration from overseas. Against such recruitment the "progressive" influences marshalled their strength. Meanwhile the building booms of their prosperous protectionist cousins to the south robbed them of such skilled labour as they might generate or capture.

In the large communities of Canada skilled men could, indeed, be found to carve, model, hammer, cast or paint anything the wit of man could conceive, but they were few, and very inadequately remunerated, and facilities were woefully lacking for the dissemination of their craft knowledge. A few shops still retained the high standards of execution of a former generation, but very few. Within his own experience the standard of execution had gone steadily down in spite of a great improvement in professional services, so far as drawings and details were concerned. A certain mechanical perfection of execution could, it is true, be realised at a price, but for the time being the vital touch and sense of craft had departed from their midst.

As to Canadian contractors, generally speaking, both great and small, were of high ability, conspicuously so in all matters of organisation and administration. They were not, however, invariably masters of their craft. The present tendency was for the execution of works to be regarded as a profession requiring a college training in civil engineering or in architecture. The man bred in the builder's yard thus often found himself in a subordinate capacity, and so tended to extinction. As a consequence, great actual responsibility fell on the clerk of works. A good one would often shoulder the real control on a job, the contractors putting themselves quite cheerfully in the position of agents to assemble material and labour, as required, leaving the clerk of works to issue all instructions. This led to rather subtle situations now and then; but generally to very good value for the client's outlay.

As the ordinary surveyor was all but unknown in Canada, and the contractor took his own quantities (rarely requiring more than a week even on a big undertaking), everyone concerned on a job had a good deal more discretion as to interpretation than with the English system. This added to the architect's responsibilities, but on the whole it made for self-respect, and professional dignity and standing on the part of the contractor.

In conclusion he had come to appreciate architecture most when she came simply robed in scale and cloaked in proportion, leaving off her heirloom adornments and abstaining from the garlandings of the season. Thus one could best conjecture both the grace of her limbs and the moods of her heart.

Discussion.

The Right Hon. Sir Hamar Greenwood, Bart. P.C., in moving a vote of thanks to the lecturer, said in connection with architecture he liked assurance. The architecture of the old castles of England consisted of serious motives rooted in fear, and was reflected to-day in the immense walls surrounding those who inhabited huge houses. In Canada the element of fear was unknown, and their architecture, at any rate, did not possess the immense walls that ruined the landscape of England. He regretted that the Canadian Government had not taken steps to preserve, historically and literally, those structures that represented the commencing of architecture in romantic Quebec. He would impress upon the Commissioner the necessity for taking steps to preserve ancient buildings which now formed one of the great traditions of that part of the British Empire.

A French-Canadian Cottage.

After Mr. W. C. Noxon had seconded the vote of thanks, Professor Beresford Pite said the lecturer had taken a wide and sane view of the architecture of a great country. It was a valuable contribution to the profession, but he was not sure what the lecturer was looking for in his description of Canadian architecture. The sense of scale was the most impressive thing in the buildings shown. In regard to the influences in Canadian architecture which had been derived from America, he thought it would have been better if they had turned their attention to the elements of the Old World. Few of the buildings shown appealed to the higher qualities of thought and life. The buildings of religion and education had only been slightly referred to. Perhaps they were not in the purview of the paper. Ultimately there was no spiritual appeal in commercial buildings; there was an absence of a deep and subtle feeling of serious reflection, although he did not suggest putting a facile spiritual meaning on an ordinary design. The impressive buildings of the world in all ages had been buildings devoted to other purposes than commerce or self-aggrandisement: it was unchallengeable.

After the President had put the vote of thanks to the meeting, and Mr. Percy Nobbs had briefly replied, the Secretary read the Deed of Award of Prizes and Studentships for the current year as follows:—

PRIZES AND STUDENTSHIPS.

The R.I.B.A. Essay (Silver Medal and 25 Guineas).—The Council regret that they are unable to award the Prize.

The Travelling Studentships (The Soane Medallion and £150).—The Council has awarded the Medallion, and, subject to the specified conditions, the sum of £150 to the author of the design submitted under the motto "England." Mr. J. S. Kelsall, Eastbourne.

The Pugin Studentship and £75.—The Council regret that they are unable to award the Pugin Studentship.

The Owen Jones Studentship and £100.—The Council has awarded the Certificate, and, subject to the specified conditions, the sum of £100, to Mr. J. H. Sexton, Battersea.

The Grissell Gold Medal and £50.—The Council regret that they are unable to award the Prize.

The Ashpitel Prize.—The Council has, on the recommendation of the Board of Architectural Education, awarded the Ashpitel Prize (which is a prize of books, value £10, awarded to the candidate who has most highly distinguished himself among the candidates in the Final Examinations of the year) to Mr. Eustace Harry Button, of No, 1, Royal York-crescent, Clifton, Bristol, Probationer 1920, Student 1921, and who passed the Final Examination December, 1923.

The R.I.B.A. Silver Medal for Recognised Schools.—The Council has awarded the Silver Medal for the best set of drawings submitted at the Annual Exhibition by Post-Graduate Students of the Recognised Schools exempted from the Final Examination to Miss Isabel Maud Chambers, of the Architectural Association School of Architecture.

Cheadle Development Scheme.

A contract consisting chiefly of large girders and roof trusses to the extent of, we understand, nearly 1,000 tons, has recently been placed with Messrs. Lambourne & Co., of Manchester, and will provide employment for some months at their Openshaw works. The steelwork is to be used in the erection of an engineering works involving building covering many acres of land, in connection with the industrial development scheme at Cheadle.

THE LAW RELATING TO BUILDING.

By W. T. CRESWELL, LIC.R.I.B.A., F.R.S.I. (*Barrister-at-Law*).

III —REMUNERATION.

"Implied" Agreement.

When an architect or surveyor enters into a contract for the employment of his services, his remuneration will, in general, be provided for in the contract; but if no such provision is made, then there is an "implied" agreement on the part of his employer that he shall be paid "reasonable" remuneration. This agreement is constituted by the request and acceptance of the architect's or surveyor's services. See Manson *v.* Baillie (Sir W.), Bart. (1885) 2 Macq. 80. Nevertheless, plans, designs or suggestions may be requested for the approval only of a prospective employer, in which case, of course, no fees can be claimed unless the work is approved; or, at any rate, made use of by the employer. See Moffatt *v.* Dickson (1853) 22 L.J. C.P. 265.

Competitions.

Again, such plans, &c., may be submitted in response to a general invitation in open or limited competition, in which case, unless remuneration is offered to all competitors in the terms of the invitation, unsuccessful competitors cannot claim any remuneration unless they are able to prove that their plans, &c., or any portion of these, have been used, either for the work advertised in the competition, or for any other purpose not mentioned therein. See Landless *v.* Wilson (1880) 8 Court of Sessions, Cases 289.

Supposing, however, it is expressly stated that plans, &c., will not be paid for, but that, in the event of any architect's or surveyor's plans, &c., being accepted and a decision on the employer's side to carry out the work according to those plans, the architect or surveyor will be paid fees for supervision in this case, and supposing his plans are used and he is *not* employed to supervise the works, he has a legal complaint. See Moffatt *v.* Laurie (1855) 15 C.B. 583. If, under any circumstances, the conditions of his employment are to make plans *and* to supervise works, then he is entitled to reasonable remuneration even if the work is not proceeded with. See Burr *v.* Ridout, *The Times*, Feb. 22, 1893. In such a case he would be entitled to bring an action for damages for breach of contract in respect of his supervision of the works See Horton *v.* Hensley, *The Times*, February 19, 1908.

Manner of Payment.

Should there be no mention in the contract of the times and manner of payment of fees, the architect or surveyor will, in general, be entitled to payment by instalments as the work proceeds. See Appleby *v.* Myers (1867) L.R. 2 C.P. 651. Should his undertaking, however, be to supervise the execution of an entire contract, payment being by way of commission on the total cost, he may not be able to enforce any remuneration until the work is complete. See Johnson *v.* Gandy (1855) 26 L.T. (O.S.) 72. Instalments, when due under the terms of contract, are "debts due and payable," and the architect or surveyor is at once entitled to sue for payment. See Workman Clarke & Co., Ltd., *v.* Lloyd Brazileno (1908) 1 K.B. 968.

"Reasonable Remuneration."

The decision of what is "reasonable" remuneration is based on the nature of the work requested and done, the time occupied, and, to some degree, on the professional standing of the architect or surveyor employed. If it is a condition of the contract that a reasonable fee will be paid, and, if he has reason to believe the employer acts unfairly in his final offer of remuneration, the architect or surveyor may take the matter into Court, when a jury would decide what is reasonable. See Bryant *v.* Flight (1839) 5 M. and W. 114. Further, if he is specially employed for additional works, such as measuring for extras and omissions, variations, &c., the employer is responsible for payment to him of extra fees or commission, not the contractor.

Forfeiture of Fees Already Paid.

In Columbus Co., Ltd., *v.* Clowes (1903) 1 K.B. 244, it was laid down that, even if an employer have finally paid fees to an architect or surveyor, the latter may be compelled to refund the whole or a part of such fees, if he have wholly or in part shown lack of skill, by reason of which the employer derives no benefit or only partial benefit from his services. In this case the plaintiffs, in 1897, being lessees of land in Carmelite-street, employed the defendant as architect to prepare plans and specifications, &c., and to engage a quantity surveyor to prepare quantities—for the erection on the site of a factory and offices. The defendant neglected to measure the site; and, acting on unauthorised information in that particular, prepared plans, &c., for a site smaller than that to be built upon. The plaintiffs subsequently found they were unable to raise the necessary funds for the scheme and agreed to pay the architect £200 for his plans, &c., and the quantity surveyor £200 for work done. In 1901 plaintiffs sold the site, when the plans were more carefully examined. It was then discovered that they did not meet the dimensions of the land, and plaintiffs sued defendant for the return of the £200 paid to him; upon a consideration that he totally failed to exercise due care and skill, or in the alternative for damages for negligence. It was held that there had not been a total failure of consideration, but that the plaintiffs were entitled to damages, which damages were nominal, since the plaintiffs had not been in a position to use, or suffer loss, by reason of the faulty plans, &c. Plaintiffs were therefore allowed £40, being the estimated charge for adapting the bills of quantities to the dimensions of the actual site.

Scales of Fees.

Certain institutions—*e.g.*, the Royal Institute of British Architects—have prepared scales of professional charges, mainly based on percentages of the total cost of works carried out; but these, as being recommended by those who are to benefit themselves, have not been viewed favourably by the Courts, and are in no way binding on an employer unless specifically agreed to by him. Juries have, however, usually accepted these scales as "reasonable"; and, in any case, it has always been held that any scale or practice in reference to remuneration, if adopted by a large proportion of the profession, should be considered as a reliable guide by the Courts.

"Ryde's Scale" has more than once been condemned in court as "not being the customary scale of fees which surveyors can insist on receiving" and in Faraday *v.* Tamworth Union (1916) L.J., Ch. 436, the Court refused to assess remuneration on a *quantum meruit* claim by reference to this scale.

Under the Housing Acts the Ministry of Health have determined the scale of fees payable for work in connection with housing schemes, but this is an exceptional case.

Ownership of Plans, &c.

When an employer employs an architect or surveyor in the usual way, does he purchase the plans, &c., or only the use of them for the work proposed? Collins, M.R., in giving judgment in the case of Gibbon *v.* Pease (1905) 1 K.B. 810, said "the contract results in the making of plans, the property in which passes to the building owner on payment of the remuneration provided under the contract, The case cannot be distinguished from that of a contract to paint a picture or design a coat of arms, as to which no question of ownership could arise." However, it is the custom for the architect to retain the plans, even though such custom has been held to be unreasonable and, in any case, he has a lien on them until final payment of his fees.

It may be added that in the above judgment, the case of Ebdy *v.* McGowan, *The Times*, November 17, 1870, in which similar questions arose, was considered and approved.

It would appear therefore that when an architect or surveyor is employed to prepare plans, &c., for remuneration, such plans, &c., become, when paid for, and in the absence of any specific agreement to the contrary, the property of the employer; and, consequently, that he can make any use of them when he pleases.

SKETCHES IN NORTHERN FRANCE.

In sending the sketches, given in this issue, Mr. H. G. H. Mills, of Egham Hill, Surrey, writes:—

"These sketches were made in the country districts of Northern France, the principal interest being the manner in which natural building materials are made use of, in forms of construction sound in principle and well suited to the requirements of a rural population at small cost.

"The walls are generally of roughly squared timber posts, rough lathing, and covered with a coarse plaster or clay lime-washed, or sometimes weather-boarded in the case of outbuildings, and are superimposed on a foundation carried about 2 ft. above ground level, of rubble or brickwork, either being invariably tarred. The roofs are usually pantiles on rough battens, and carried well down at the eaves, the whole giving a very pleasing external appearance, an idea of three different types being given in Sketch No. 1.

"Sketch No. 2 is a truss in an outbuilding, of which the partition forms part, a detail of a more common construction at the eaves, and an end view of the tie beam. The latter is of most interesting construction, being carried through the wall post of the truss and secured by a pin or cotter, and thus utilised to prevent the wall spreading. This form of construction is very common.

"Sketch No. 3 is of a weather-boarded end, covering a more elaborate truss, the construction of which can be fairly well seen, and is more fully indicated by the diagram. The tie beam would normally be covered, the weather-boarding in this particular case having carried away.

"The wells (Sketch No. 4) show, in two cases, an attempt to provide some sort of weather protection to the 'drawer.' The winding apparatus is very primitive, and the wells are generally placed in positions which violate all principles of hygiene, but contaminated water appears to have little effect on those inured to it."

Obituary.

We regret to announce the death of Mr. William Higgs (the senior governing director of Higgs & Hill, Ltd.), who died at his home, at Stockwell, on January 17, in his seventy-second year. Mr. William Higgs was the eldest son of William Higgs, the founder of the business carried on at Crown Works, South Lambeth. He entered his father's business in 1868, and continued with him till his retirement in 1874, when he was joined by the late Mr. Joseph Hill, who, prior to this, was trading with his brother, in Islington, as Hill & Sons. The business was carried on at Crown Works from 1867, under a deed of partnership, until 1898, when it was converted into a private company, the sons of the partners becoming directors. Mr. Higgs devoted his private life to the Spurgeon's Orphan Home, of which he had been trustee since his father's death forty-one years ago, and treasurer since 1900. The interment took place in the family grave, at Norwood, on Monday the 21st inst.

The death has occurred, at the age of eighty-three, of Mr. John Williams, Pencoed (Glam), founder of the Pencoed Brick Works.

R.I.B.A. STUDENTS' COMPETITIONS.

IT is not a great year amongst the R.I.B.A. prize-winners, but we can hardly expect a revival of the keen interest which was felt years ago in these competitions until we get some fresh life and interest into our students' work. We fear there is a lack of some inspiring quality, and yet it should hardly be so, for architecture is not without ardent devotees both amongst our older and our younger men. We sometimes think our students are apt to forget that whilst study and knowledge, effort and tenacity, are very valuable things, they are only, in a sense, the tools with which we work, and an innate consciousness of the artistic appeal must accompany our efforts if we are ever to create beautiful work. We have the greatest admiration for the pluck and hard work which so many drawings at the Institute show from year to year, but we cannot help asking where it all leads. Take, for instance, the interesting subject for the Soane Medallion this year—a cathedral church. However we may fortify ourselves with considered details of measurement and construction, the main idea of such a building is to create a great structure which shall not only make worship conveniently and comfortably possible, but by its exterior expression shall satisfy our need for beauty, help to elevate our thoughts, and typify our aspirations.

We admit that a fine plan suggests all sorts of beautiful possibilities in elevation to the imaginative mind, but we venture to think that a certain disappointment meets us in all these cathedral designs when we turn from the plans to see how they are expressed in elevation.

Do our students feel a thrill of pleasure when they sit down to rear the fabric from the plan? Do they very really try to evolve some beautiful quality of dignity of tenderness of mass; some sense of breadth and repose, or some gem-like quality of beautiful detail? We can hardly believe, judging from the average designs we see, that they are anything more than a more or less arduous task. We should like thoroughly to discourage everyone who is aiming to practise an art for which his mind and thought are unfitted, but we would encourage to our utmost any evidences of a capacity to appreciate the qualities of fine architecture. We have seen in our time many extremes of statement, and amongst them there have been alternating a warning or a praise for good draughtsmanship. This is one of the things a student must settle for himself, but he need no more be discouraged because he cannot accomplish great tricks or great cleverness in draughtsmanship than he should be afraid that fine draughtsmanship will mislead him in his work. We ought not to be afraid of our critics. If we see a student becoming so distinguished in his mere handling of a pen or pencil that he neglects or injures his design through it, we should be inclined to think he had, after all, found himself in one thing though he had lost himself in another.

We feel that these annual competitions only answer their purpose if they give inspiration to those who are capable of profiting by it and gain encouragement in their studies. We still think the lessons of art which they are supposed to teach are aimed too high, and that simpler subjects would be better.

The Soane Medallion subject is an Anglican cathedral church with a nave floor area of 15,000 square feet. There was no limitation as to style, and the walls were to be faced with stone. What may be considered the most originally treated church is a sort of early Flemish Gothic design, "Phœnix," with a strongly pronounced verticality. It has lofty, double flying buttresses and very tall, narrow windows, no string courses or parapet moulding. Over the crossing is a lofty tower some 14 ft. square, with belfry windows 30 ft. high. A good character and proportion is observed throughout. The width of nave and aisles is about 50 ft., and the vista from narthex to altar is about 220 ft.

"Seep" has a fine monumental plan. The nave is only 25 ft. wide, aisles of about 10 ft., and outside that are six chapels north and south, of same width as aisles. The transept is of same width as the nave, with similar aisles. The east end has a semi-circular apse, with six radiating chapels, and in the centre between these the lady chapel is prolonged out to the east. There is a saucer dome over the crossing, 70 ft. diameter. The exterior is well treated, with an octagon lantern at the crossing and an outstanding square belfry tower. This detail is carefully thought-out, but there appears to be little or no light in the building.

"England" is a design in middle-pointed Gothic, worked out with some care and quality. The nave and aisles, about 55 ft. wide, with two low square towers flanking the crossing of nave and choir, and incipient towers at the west end.

"Dean" has an admirably treated design, very well drawn. The interior is designed with boldness and in good proportion, the east end suggesting the Baths of Caracalla. The columnar arcade to the aisles is good. The twin flanking towers and dome between and simple mass of the whole group would be telling. The design does not suggest nearly so large a building as that indicated in the conditions, and the large spacing of parts would lessen the apparent size, as in the case of Bentley's Westminster Cathedral. The author of this design, if he is not forced into other ways, should go far. It is a pleasure to see a design so well and feelingly drawn; it is quite nice sometimes to see good draughtsmanship not aping Beaux-Arts methods.

"La Trinité" does even worse to belittle his building, for he has only two wide bays and one small one to his nave. The proportions of the design are unhappy. "Lampsacus" shows a design with some Greek feeling, but the proportions are not very pleasing.

For the Pugin studentship, Donald H. McMorran has several careful drawings of the beautiful church of Northleach and a few quite good freehand sketches. Jas. F. Hampton shows a large selection of interesting subjects. W. J. B. Price has made some interesting choice of subjects, but his work is rather heavy-handed. Claude J. W. Messent has some nice drawings, but no freehand sketches; there are good subjects in the East country: and they include the unusual door of Salle Church, Norfolk. Altogether, the Pugin Competition has fallen from its high estate this year.

For the Grissell Gold Medal there is only one design—of a motor garage engine factory. The construction is carefully worked out, but the design is very poor.

In the Owen Jones Competition the drawings by J. H. Sexton show commendable power of illustration, and his design for wall-painted decoration for a guild room shows some real knowledge of colour effect.

Some excellent drawings and sketches by N. Goodson and D. S. Holt (Tite Prizeman, 1922) are exhibited. One or two, at least, are almost models of what a drawing may be at its best.

It is quite a treat to look over the admirable studies by Mr. A. Newton Thorpe, the Pugin Student, 1923. We have never seen anything better, and when the history of our contemporary draughtsmanship is fairly represented it will not do to overlook such things as Mr. Thorpe's "Poppy Heads in Southwold Church." It is indeed good to see draughtsmanship so evidently speaking from the feeling of one who appreciates his subjects so well.

Irish Housing.

President Cosgrave introduced in the Dáil recently a bill providing £300,000 to facilitate the building of dwelling-houses, by grants to builders. Since the war, he said, an enormous difference had existed between the cost of working-class houses and the price people were able to pay for them, and it was to some extent the object of the Bill to bridge that difference.

R.I.B.A. MINUTES.

WE take the following notes from the Minutes of the Council meeting held on January 7:

Visiting Board for the Recognised Schools.—On the recommendation of the Board of Architectural Education, the Council sanctioned the creation of a visiting board to assist and report upon all schools applying for or enjoying exemption from the Royal Institute Examinations.

Interchange of Students between Schools of Architecture.—The Council accepted the principle of the interchange of students between one recognised school and another on the understanding that, in the case of such students, exemption from the examinations of the Royal Institute would be granted only on the joint recommendation of the Head of the School and the external examiner or examiners.

It was also decided that in the event of students from schools of architecture not recognised (for exemption from the examinations of the R.I.B.A.) entering a course at a recognised school, each application from such a student for exemption from the the R.I.B.A. examinations should receive sympathetic consideration on its merits.

Ashpitel Prize, 1923.—On the recommendation of the Board of Architectural Education, it was decided to award the Ashpitel Prize for 1923 and the Mark of Distinction for Thesis to Mr. E. H. Button.

Shortage of skilled labour in the building industry.—The National Federation of Building Trades' Employers and the National Federation of Building Trades' Operatives have accepted the invitation of the Council of the R.I.B.A. to appoint representatives to take part in a joint conference on the subject of the shortage of skilled labour in the building industry.

MEETINGS.

FRIDAY, *January* 25.

Royal Institution of Great Britain.—Sir Aston Webb on "Future Development of London." At 21, Albemarle-street, W. 1. 9 p.m.

Glasgow Architectural Craftsmen's Society.—Mr. A. Cullen on "Notes on the Building Stones of Scotland." At Royal Technical College. 7.45 p.m.

SATURDAY, *January* 26.

Royal Institute of British Architects.—Visit to the Bank of England.

MONDAY, *January* 28.

Architectural Association.—Mr. B. Oliver on "Case for the Preservation of Old Buildings." At 34, Bedford-square, W.C. 1. 7 p.m.

TUESDAY, *January* 29.

Society for the Promotion of Roman Studies.—Mr. R. G. Collingwood on "British Frontier in the reign of Septimus Severus." At Burlington House, Piccadilly, W. 1. 4.30 p.m.

National Federation of Building Trade Employers.—Annual Dinner. At Hotel Victoria, Charing Cross, W.C. 2. 7.15 p.m.

University of London.—Mr. G. A. Sutherland on "Acoustic Demands in Auditorium Design." At Gower-street, W.C. 1. 5.30 p.m.

WEDNESDAY, *January* 30.

L.C.C. Central School of Arts and Crafts.—Sir Banister Fletcher on "Roman Architecture." At Southampton-row, W.C. 1. 6.30 p.m.

THURSDAY, *January* 31.

Auctioneers' and Estate Agents' Institute.—Mr. M. Beavan on "Valuations." At 34, Russell-square, W.C. 1. 6.30 p.m.

The Raffles College, Singapore.

In their report, the authors of the successful design, Mr. Cyril A. Farey, A.R.I.B.A., and Mr. G. R. Dawbarn, M.A., A.R.I.B.A., state:

"The main College buildings face north-east. This choice is governed by the following considerations:—

"(*a*) As the sun passes almost directly overhead from east to west, it is very undesirable that any building should face either due east or due west. On the other hand, the atmosphere of Singapore is so humid that it is highly desirable that direct sun should be able to enter every room for a short time every day. That this may be attained, and that the rooms may, at the same time, be kept cool, a north-east aspect is considered ideal.

"(*b*) A spur runs from the hill summit in a north-east direction. An economic, and, at the same time, symmetrical lay-out, has been obtained by placing the buildings astride this spur, the axis of the spur being taken as the axis of the scheme.

"(*c*) The Bukit Timah-road is the most important boundary. By choosing a north-east aspect, a comprehensive and effective view of the scheme is obtained from this road.

"The houses for the European staff and the three hostels, occupy the summit of the hill. The main College buildings are 13 ft. lower. All the principal buildings are thus on high ground. Great care has been taken to minimise 'cut and fill.'

"The Administrative block is placed on the main axis, and is in direct communication with the main College buildings. Cars and pedestrians have direct access to this block from the main approach without first entering the quadrangles.

"Although the lay-out has been conceived on the assumption that the complete accommodation given will be required, care has, at the same time, been given to so dispose the blocks which are to be erected immediately, that, as they are completed, they will group together and will be in due relation to each other.

"The main College blocks have been planned so that they can, if necessary, be extended at some future date. These possible extensions are suggested on the lay-out plan by dotted lines.

An area for playing fields is reserved axially beneath the sports pavilion, whence a comprehensive view could be obtained.

Each hostel looks over its own garden and has direct access thereto.

The main approach is from the Bukit Timah-road and ascends gradually to the administrative block.

On either side two quadrant carriage drives proceed under the Arts and Engineering Blocks and ascend past the hostel blocks to the road containing the staff quarters. The College quadrangle is intersected by two paths connecting the main entrances to the different blocks, and the hostel quadrangle has a continuous path surrounding an uninterrupted lawn.

Complete circulation is provided in the various buildings by verandahs containing large openings to the air.

The Science Block is grouped with the other buildings, included in the first building operation

All three Hostels give precisely the same accommodation for students' quarters, all rooms being protected by ample verandahs. Each student has a cubicle opening on to a verandah. Rattan swing half-doors are fitted allowing continuous ventilation whilst allowing adequate privacy. The pitched roof runs over the verandahs and is ventilated at ridge and eaves.

The five houses for staff quarters included in the first operation are grouped together as one unit. On the ground floor verandahs are placed on all sides except N.E. The first floor is protected by broad 4 ft. eaves.

In the provision for future building operations, in respect of the administrative block, the porte cochère gives access to the waiting hall, whence there is access to the principal and the registrar, to the main quadrangle, and to the great stair leading to the hall above. On the right is the librarian's wing and on the left the stage, with retiring rooms; also caretakers' rooms and chair store for 500 chairs. The library is combined with the great hall, the books being housed on three levels. In the galleries tables are provided where the students can work direct from books of reference. Additional rooms are provided for manuscripts and special collections.

The design for the arts block is only tentative and has not been fully worked out.

The engineering block is also very tentative and no comments are necessary at this stage.

The sports pavilion is on slightly rising ground overlooking the whole of the playing fields.

Quarters for 20 general servants are shown in the form of a court, three sides of which are formed by rooms of about 90 ft. sq.

A similar plan is adopted in quarters for six gardeners.

Additional staff quarters are all placed on high ground and are similar in type to those previously dealt with.

The architectural style adopted is of collegiate character and it has been thought desirable to group the main buildings around two quadrangles in order to give the collegiate character of the older universities.

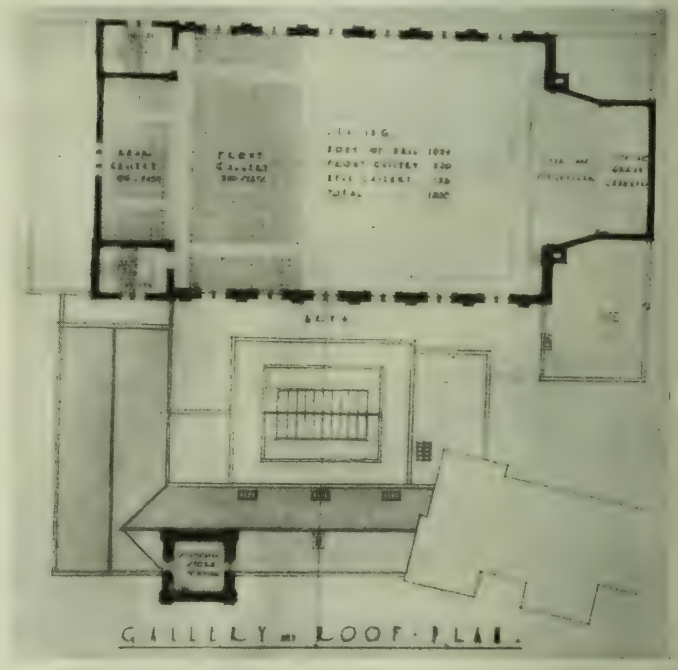
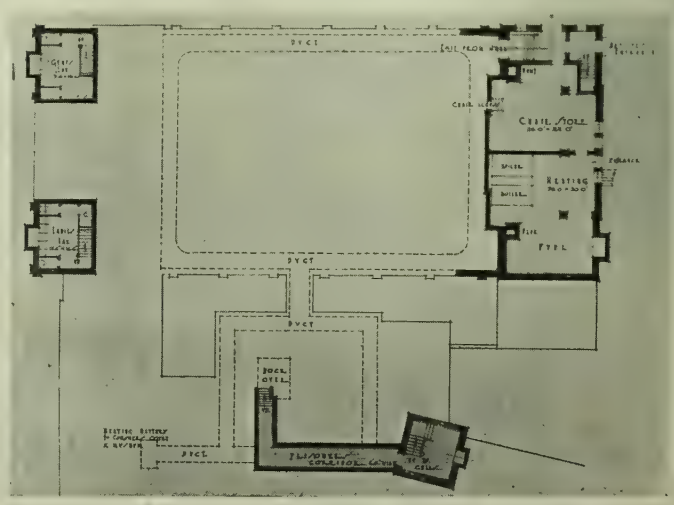
XIV.—Economy.



"I WOULD not have that useless expense in unnoticed fineries or formalities, cornices of ceilings and graining of doors, and fringing of curtains, and thousands such." These words are from "The Lamp of Sacrifice," one of the Seven Lamps of their author, John Ruskin. They were to result in a revolution of artistic values, far more comprehensive than the prophet dreamed. When we consider how anarchistic they were when first uttered, how menacing to the vested interests of the day, it is indeed a tribute to the force of an idea when we remark the vast fabric of mumbo-jumbory that, as its significance was realised by the Victorian mind, gradually fell away; nor is it entirely surprising that there still linger vestiges of the queer heresy which Ruskin exposed. We have done with the fringes; we have almost finished with the graining; but the cornices, though threatened, still flourish.



There is about building still far too much hocus-pocus in construction and carving, which has not the least justification, but which continues as a weariness to the eye and a puzzle for the mind of the spectator, who, if he thinks at all, is irritated because he can find no solution for the insoluble. Not only in carving is it evident that death is upon it. It is long since it had the flame of life, but, that in a hundred and one of the trimmings of buildings, in columns and pediments, domes and turrets, hang about our ears, as meaningless affectations and wasted expenditure. Of course, everyone is not equally guilty, though the number who are blameless is surprisingly few. There are obvious signs of the growing realisation of the important influence of economy, in that creators are eliminating every vestige of needless form and ornament, yet they persist in retaining non-committal square plinths, string courses, pilasters and cornices, very evidently the result of the tee-square and the set-square with which they were fashioned. It is gain that we have evolved so far; still, there is a difference between economy and miserliness.

Economy is readily considered in respect to sculpture, not merely by its profusion or its omission, but by its technique. The decline of sculpture preceded that of architecture, and its revival is more evidently manifest. Who recognises as ever having had a separate existence those pretty curly-haired cherubs, burdened with rose wreaths and wrestling unequally with cartouches; they are stock properties, each as like each other as they are dissimilar from anything on earth, blindly, conventionally exact representations of some impossible, never-existent model. For real children have curiously misshapen heads, comical mouths, pig-like eyes, protruding ears, recognisable, individual, and adorable, as unlike the *amoret* as possible in their appearance and habits. And yet innumerable hours have been wasted on the fabled representations. Every wisp of hair, every eyelash, every finger-nail, wasted, for the sum total is death, not life. Living sculpture does not lose the wood for the trees: every stroke of the chisel disturbs in order to reveal, and the moment revelation comes, leaves well alone: not a single stroke too many, not a single stroke too few, that is economy. Representation is the aim of sculptors, not imitation. It is equally true of building.

That ubiquitous person, the ordinary man, who delights to dub himself practical, regards the question, as he rightly considers, in the unemotional light of high finance, the adequate payment of return upon capital sunk in building. In a general way this is a very useful guide and corrective, especially in regard to commercial building, which owes its very existence to the system of which it is a part, but even in reference to commerce certain magnates have realised the potentiality of altruism, and latterly the psychological effect of surroundings upon their staff and customers; truly these still show a return, though it is different in kind to that originally sought after by their kind. But there are whole hosts of buildings the value of which cannot be reckoned to the community in so ready a fashion. There are monuments which it is entirely impossible so to appraise. We do not care to assess the sum appropriate to be expended upon a war memorial upon any commercial basis: the mere thought of so doing is repugnant. The rigid humanitarian looks upon any expenditure as waste which does not supply some need of the living. Expenditure upon triumphal arches and artificial mounds will never again reach the proportions of the past. The booty and the captives are not available to the victors in modern war. We require that they shall be lasting, because they are intended not to remind ourselves, but future ages. They are not to glorify the present, nor yet to impoverish it: they are to bear witness to our gratitude to the sufferers, not to the subscribers; thus to inscribe the names of the commemorated is fitting, but to add that of the donors is extravagance, if not worse. Having determined the prospective life of a building, it is economy that so selects the material that it shall serve its time, neither perishing too soon nor subsisting too long. Economy further demands that neither materials nor labour shall have been abused. The cathedrals were afforded in times when the wealth of the Church or the nation was nothing like so high as to-day, because all men were of the conviction that nothing was too precious to be consecrated to the service of God. But over-emphasis is balanced by under-estimate: a treatment unworthy and insubstantial is equally to be deplored.

In all the arts economy is a quality after which the creator should strive. Instinctively we are repelled by extravagance. In etching we recognise the maximum in suggestion by the minimum of lines. In poetry we require the crystallisation of wisdom and emotion. Architecture is no exception. The Spartans did without city walls: possibly they over-exaggerated the art of repression. Though they escaped the vulgarity of Rome they failed to attain the sublimity of Athens.

PRACTICAL DESIGN FOR BUILDING CONSTRUCTION—III.

AN ELEMENTARY EXPLANATION OF THE APPLICATION OF THE THEORY OF CONSTRUCTION TO PRACTICAL DESIGN.

By EWART S. ANDREWS, B.Sc., M.I.Struct.E., A.M.Inst.C.E.

SECTION 1. WALLS AND FOUNDATIONS (continued).

Pressures on Foundations.

The design of the foundations of a building is a matter of very great importance and sometimes of considerable difficulty. We like to distinguish between matters of real difficulty and those of difficulty in the sense of complexity. Many of the calculations for steel stanchions and continuous reinforced concrete beams are complicated and difficult in the sense that it takes some considerable amount of study to become familiar with them and the calculations are sometimes lengthy; but we are quite confident in the results, and the difficulty is not real in the sense that we cannot obtain sufficient reliable data to guide us. In the case of foundations, the calculations themselves are not at all difficult, but the difficulty lies in deciding upon what should be taken as the safe pressure on the soil and whether the soil is constant in resisting power over the whole site.

Another difficulty arises with foundations upon clay soils that the clay in some cases seems to move bodily, sometimes by one stratum sliding over a lower inclined stratum or by the movements caused by the differences in volume according to the amount of moisture in the soil. In very dry summers the bay fronts of houses built upon clay soils sometimes develop the unpleasant habit of dissolving partnership with the main portion of the house, and other troubles arise for which it is a matter of real difficulty for the architect to advise a certain remedy without incurring great expense. Certain principles can be adopted which will minimise the troubles due to unequal settlement, which is the greatest trouble, there being little danger if a building settles uniformly.

With this in mind, the foundations should be so proportioned that the pressure per square foot thereon is as constant as possible. This is done by calculating the loads coming down the various walls, piers and columns when the floors of the building are fully loaded and making the areas of the foundations proportioned to the loads.

We should remember that most buildings are seldom fully loaded to the full extent for which the floors are designed, so that at any time the actual pressures on the soil are less than those which we calculate; except in certain warehouse buildings, therefore, which commonly carry heavy loads over long periods, we have a margin of safety in our foundations which does not appear in our calculations.

Safe Pressures on Soils, &c.

The following figures are usually taken as the safe pressures which may be assumed in calculations, the figures being in tons per square foot:

Made ground	0·5
Soft clay or loose sand	1
Ordinary clay or compact sand ..	2
Blue clay, compact gravel or chalk	4
Soft, friable rock	5
Ordinary rock	10
Hard rock	20

In cases in which heavy loads have to be carried or in which the subsoil varies on the site, the bearing power can be measured experimentally by loading cylinders until they sink in; working pressures may then be taken as about one-fourth of the values thus taken. These tests should be made at the depth at which it is proposed to make the foundations, and it should be remembered that the pressures on large areas should not be taken as high as those measured on small areas.

In one of the most serious failures in foundations which have occurred in recent years, namely, that of a grain elevator at Winnipeg, Canada, the pressure on the foundations was less than that given by loading tests on cylinders, and it is usually regarded that the trouble was due, in part at least, to failure to reduce the pressure to allow for the large area over which it acted. A study of this failure is well worth the attention of all interested in the subject of foundations; an account will be found in a paper by Mr. Lawson S. White, in the Proceedings of the Concrete Institute, 1921.

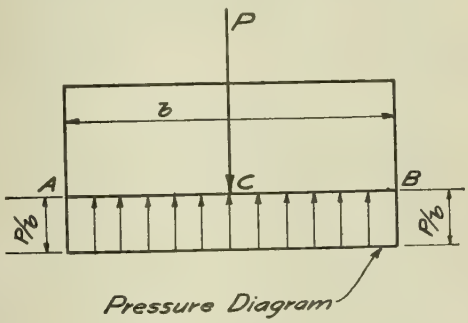

FIG. 3.

Calculations for Intensity of Soil Pressure.

If we know the total pressure upon a foundation we calculate the intensity of pressure according to the one of the following rules which is appropriate.

(*a*) *Pressure Central.*—In this case, as illustrated by the pressure diagram, shown in Fig. 3, the pressure is uniform over the whole section.

It is usual to consider the pressure on foundations per ft. of their length. If P is the pressure per ft. length, the intensity of pressure (p) on the soil is given by dividing the total P by the breadth (b) of the base; expressing this in terms of a formula we have:—

$$\text{Intensity of pressure} = p = \frac{P}{b} \qquad (1)$$

(*b*) *Pressure Eccentric but Inside "Middle Third."*—Now, suppose that the resultant pressure P comes eccentric, but inside the points X and Y, Fig. 4, which are called the *middle third points*, and are each at a distance equal to $\frac{b}{6}$ from the centre so that the distance between them is one-third of the base.

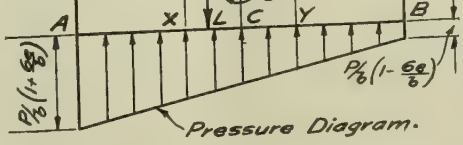

FIG. 4.

The effect of the eccentricity of the load is to cause the intensity of the pressure to become greater on the edge A, nearer the *load point* L, at which the line of the resultant pressure cuts the base than at the other edge B, the intensity of pressure gradually decreasing from the edge A to the edge B, as shown on the pressure diagram.

The maximum intensity of pressure occurs at A and is obtained by multiplying the mean intensity of pressure (which is equal to the total pressure P, divided by the breadth b) by the quantity $(1 + \frac{6e}{b})$ i.e.:

$$P\,max = \frac{P}{b}\left(1 + \frac{6e}{b}\right) \qquad (2)$$

The minimum intensity of pressure occurs at the edge B, and is given by the relation

$$P\,min = \frac{P}{b}\left(1 - \frac{6e}{b}\right) \qquad (3)$$

We must wait for a later stage of the subject before we explain why it is $\frac{6e}{b}$ that is added to allow for the eccentric effect of the load, but will remark that it is due to the application to this problem of the formulæ for beams, a wall being really a form of vertical cantilever.

We will note that if the load point L comes at the extreme edge X of the middle third we have $6e = b$ and the intensity of pressure at the edge A becomes equal to $\frac{2P}{b}$ and that at the edge B becomes zero, the pressure diagram becoming a triangle.

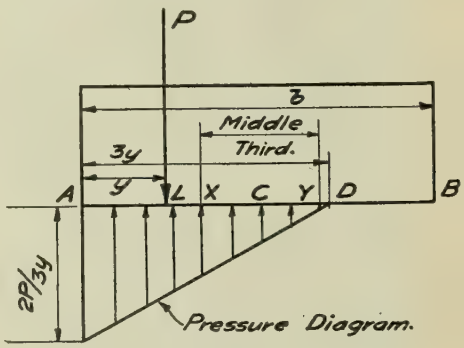

FIG. 5.

(*c*) *Pressure Eccentric but Outside "Middle Third."*—In this case, Fig. 5, we take a length A D equal to three times the distance A L of the load point L from the edge A, and assume that the intensity of pressure is spread over the length A D and varies uniformly from the edge A to the point D.

The pressure diagram thus becomes a triangle and the maximum intensity of pressure is obtained by dividing twice the total pressure by three times the distance from the edge to the load point.

This is expressed in symbols by the formula

$$P\,max = \frac{2P}{3y} \qquad (4)$$

This is sometimes called Wray's rule and is very useful and based upon a reasonable assumption.

In all cases of these pressure diagrams it should be noted that the area of the pressure diagram represents the total pressure P and that the line of action of the total pressure will pass through the point called the centroid of this diagram.

Memorial at Monchy.

The Isle of Wight County Committee for assisting Monchy-le-Preux under the British League of Help met recently, Major-General Seely presiding, to inspect drawings prepared by the Chairman's son, Captain John Seely, of the ancient Lych Gate at Mottistone, Isle of Wight. They were approved as a visible and permanent memorial of the island's help, to be erected at the entrance to Monchy Cemetery, and the Committee regarded them as admirably suited to the purpose.

The chairman said it was proposed to introduce in the design of the gate some old panelling of the time of James the First, which had just been found and which probably came from old Brook House, which once occupied the site of his present island residence.

THE ARCHITECTS' AND BUILDERS' INQUIRY BUREAU.

Solid or Hollow Ground Floors ?

SIR,—Your inquirer "Economist" is interested in the search after economical methods in the construction of the small house. He notices that whilst the architect prefers solid ground floors, the speculating builder almost invariably favours the old system, or rather, what "Economist" terms the old system, of light joist on sleeper walls. Though why he should designate this the old system is not quite clear; for, if the enquiry were to be made, it is quite possible that it would be found that a far greater proportion of old cottages had solid floors than framed floors; if, indeed, it were not proved that the hollow floor was quite a recent innovation of no greater antiquity than the early Victorian period, that time when so many cheap and nasty things were introduced.

Possibly the most satisfactory way of arriving at what is most economical in building small houses is not by comparing the methods of the architect with those of the speculative builder, for their interests are obviously opposed. But, as the comparison has been made, and "Economist" desires information as to the cost of the two methods, it may be pointed out that there is no real difference in the cost of the two methods of construction, provided that each is properly performed; and that it is just this opportunity that the hollow floor affords for improper construction that leads the speculative builder to favour it. Given a site more or less level and with a satisfactory subsoil at not more than three feet below ground line, and as has been said a proper method of construction in both cases, it is quite within the possible that the solid floor would work out the cheaper. The point as to the proper method of construction is somewhat stressed, as it is just the opportunity that the hollow floor affords for scamping that has led to its popularity in certain instances.

In the formation of any kind of floor the first essential is the removal of all vegetable soil from the whole of the site of the proposed house; and in both cases, hollow or solid, the second essential is the laying in of a solid bed of concrete, never less than 9 in. thick. This, in the case of the solid floor, becomes the foundation on which the surfacing for the wood blocks or other flooring is laid, and in the case of the hollow floor it becomes the foundation for the sleeper walls. But in the latter instance, it has a far more important function to perform. This may be shortly described as the exclusion of damp, vermin, and vegetable growths. Here it may not be out of place to refer to an incident which came under the notice of the writer, as it has a very definite bearing on the point under discussion, and is illustrative of the result of omitting the "all-over" concrete foundation. Bad smells had for some time troubled the nostrils of the occupants of a house in one of those rows that spread like measles before the war; and these were particularly offensive in the kitchen. Bad drains were feared; but an inspection led to no more satisfactory discovery than that the drains were as they should be. This, in itself, was satisfactory, but it did not remove the trouble. Time passing and the trouble growing worse, the cook one day reported that one of the floor boards in the kitchen where she had for some time noticed an unevenness, had now by some invisible agency been raised up right out of their proper seating. The sequel has to be seen to be believed; nevertheless, it is a fact. When the floor board was prised up it was found that the cause of its eruption was a very healthy plant of horseradish! But that was not all that was revealed to sight. The whole area beneath the kitchen floor was a miniature forest of fungoid growths!

This, of course, was the result of the vegetable soil not having been removed at the time of erection, and the omission of any surface concrete. Of the two, the removal of the vegetable soil is, perhaps, more important than the surface concrete, though, of course, the latter should never be omitted; but if one of the two had to be dispensed with, it would be the concrete surfacing. For so great is the strength and vitality of certain of the deep rooting plants that they have been known to grow through a 9 in. paving to a stable yard.

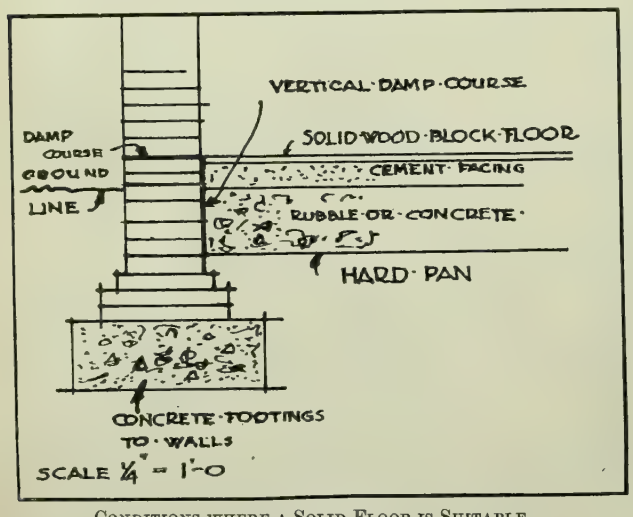
It was said above that, given equal conditions of an average site, perhaps there would be very little difference in the cost of the two methods. This brings me to the point as to why the solid floor is more suitable in some cases and the hollow in others. Obviously, if the top soil was very deep, and considerable excavation was necessitated to arrive at a suitable foundation, to refill with other soil, rubble or concrete would be altogether too expensive. And as a solid floor should never be built below ground level, unless it is in a basement, where the added accommodation will compensate for the additional expense of waterproofing the horizontal walls below ground level, in such an instance as this it would obviously be cheaper to lay in 9 in. of surface concrete all over the excavated area, and to build sleeper walls and bridge over with a joisted floor. On the other hand, if the top soil is shallow and a good hard sub-soil suitable to build on is soon reached, it is a matter open to doubt if the hollow floor would work out very much cheaper, if at all; and certainly there can be no two opinions as to the much greater satisfaction to be gained from the solid floor.

"Economist's" next point raises a question, the satisfactory discussion of which would possibly necessitate the occupation of more space than is at the disposal of the Enquiry Bureau. The distinction between the water due to condensation and that due to the percolation of damp is a very large and difficult subject, and one on which a book might well be written.

In the present instance, it might be permissible to ask if "Economist" can give proof that the moisture that has been complained of as gathering under the linoleum is due to condensation at all, and not to percolation; for if the floor in question is entirely covered by linoleum it is not easy to see how the solid floor underneath can condense water from the air, for, surely a surface, to act as a condensing surface, must be exposed to the air. On the other hand if the damp be due to percolation, it raises the whole question of water-proofing, and into this might come the question as to whether there is any really satisfactory method of the entire exclusion of damp from percolation through concrete surfaces known to the building trade?

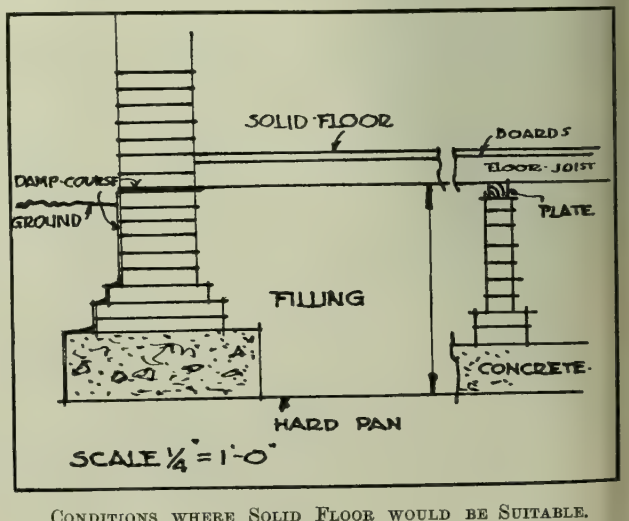
London. N. B. H.

SIR,—Your correspondent "Economist" is certainly correct in stating that the speculative builder favours the old fashioned joisted floor on sleeper walls, and it is safe to a certain extent to take this fact as an index of relative cost. It is taken for granted that the term speculative builder is intended to mean a man who builds the cheapest sound work to sell, and not our old friend "Jerry."



Surface concrete is intended mainly to arrest vegetable growth and its purpose is adequately fulfilled by a very mild mixture of lime concrete. The concrete under a solid floor must be, on the contrary, a very efficient damp resister, accurately laid and levelled, and quite possibly of double the cost of ordinary surface concrete. Honeycombed sleeper walls, which rest direct on the surface concrete, are a very minor matter of expense, as are the light floor joists.

I think there is little doubt that the hollow floor has it every time.



"INTERESTED."

SIR,—The question of solid or hollow ground floors is a very important one.

The complaint is often made against the solid floor that it is colder than a hollow one, but if the concrete is covered with boards and as wood is an excellent non-conductor, I do not see how this alleged defect can be a real one. Where the subsoil is naturally damp a good layer of broken

CONDITIONS WHERE A SOLID FLOOR IS SUITABLE.

CONDITIONS WHERE SOLID FLOOR WOULD BE SUITABLE.

THE DIAGRAM ON THE RIGHT SHOWS HOW HOLLOW FLOORS WOULD BE PREFERABLE IN SUCH CONDITIONS.

Solid or Hollow Ground Floors. (*See Reply by* "N. B. H.")

brick or stone under the concrete will serve to keep the concrete dry and so minimise loss of heat downwards. Mr. E. E. Smith is content with square-edged boards, but is it not advisable to have them tongued and grooved, so that in the event of some of the nailing not holding well there is less likelihood of boards becoming loose?

I am surprised to see that in Mr. Smith's experience the two types of floor are about equal in cost, because if the damp-proof course is kept at the same height above the ground level in both types, the floor level of the hollow floor must be higher than that of the solid floor, otherwise the fresh air inlets will have to be cranked and their efficiency impaired. This increased height means one or two extra courses of brickwork to every wall and partition, which would appear to put the balance of cost in favour of the solid floor. In addition, all houses require some portion of the ground floor to be solid, at scullery, &c., and when the solid and hollow meet there is trouble with the damp-proof course, and the fresh-air flues require to be carried through the solid portion, all of which adds to the cost.

The coating of pitch and tar required to the solid floor must be very carefully done; a few square inches missed—and there is great danger of this around hearths—may result in an outbreak of dry-rot, from which solid floors are not immune.

Taking everything into account, the balance seems to be in favour of the solid floor.

J. GRIEVE.

Hot Water Circulation Pipes.

SIR,—I should like to take advantage of the new column you are devoting to enquiries, to ask the following question:—

What is the best method to run the hot water circulation pipes in a bungalow? The boiler is behind the kitchen range, but the cylinder is fixed in the bathroom on the same floor level; in order to reach the cylinder, it is necessary to pass a door, which ever direction the pipes are run.

Is it possible to arrange pipes with the cylinder fixed on the floor level, and still ensure a good circulation and hot water supply?

STUDENT.

Huddersfield.

Damp on Ceilings.

SIR,—The explanation asked for by Mr. Ernest Matthews is very simple. During the rough weather we had the wind was north and east, accompanied by very fine snow and sleet, which was driven under slates and tiles (where not felted or torched) in numerous cases, and laid on the top side of plastered ceilings until it thawed and showed through into the room.

WILLIAM BROWN.

Luton.

SIR,—Your correspondent hardly gives enough information to advise him in his difficulty. He does not state whether the roof, in question, is high or low pitched. Also the covering, whether slates or tiles? If a store cistern is fixed in the roof? If there are rooms above those, where the damp stains appear? Whether there are parapet gutters; eaves gutters; or a centre box-gutter passing under the house from front to back?

The position of the stains on the ceilings would, to some extent, locate the defect; although rain-water is sometimes blown along by the wind, and does not always reveal itself at the place of entrance. Rain-water and wind, are the two enemies to roofs. There is a cause for every abnormal state of affairs, and the best advice to give is, to find out the cause and apply the remedy. To put the whole case in a nutshell, it would be well to have an examination made (if this has not been done) as near the damp stains as possible, when the source of the evil may be traced. The roof is the crowning member of a house, and requires constant attention.

ANDREW SOUTH.

Kingston-on-Thames.

SIR,—There seems to me little doubt but that your correspondent, Mr. Ernest Matthews, of Polegate, has had a snow drift on the particular ceiling where the damp showed through.

This may be caused through the tiles not being torched, or perhaps bad places in the torching, especially behind the rafters.

It seems the foolish practice of the architect to-day to specify tiles to be laid to a four-inch gauge and not to have them torched, whereas before the war it was the usual practice, even with jerry work, to specify them to be laid to a three-inch LAP and to be TORCHED with hair mortar. If necessary then, why not now?

I assume from the district that this would be a tiled roof; our friend does not give the necessary information.

GEORGE GODDARD.

Cost of Walls.

SIR,—I shall be very much obliged if you can give me any information with regard to the comparative cost of walls in buildings built of hollow porous terra-cotta partition blocks (12 in. by 9 in. by 2½ in. or 3 in.) and ordinary brickwork.

H. M. SANKEY.

London.

Housing Subsidy.

SIR,—I am intending commencing business as a builder and shall build houses of a type costing from £600 to £700 each (detached), exclusive of ground.

Can you tell me if there is any grant or subsidy towards the cost of this type of house, and will you tell me where I can obtain all information of this sort?

GEO. A. BRIERLEY.

Reply.

[We would refer you to the Housing Act, 1923, and to Circulars 388A and 471, issued by the Ministry of Health and published by H.M.S.O., Imperial House, Kingsway (2d. and 1d. respectively). Both of these explain the extent to which local authorities can assist builders. Before taking action it is desirable to ascertain that the local authorities will help you to the extent they are allowed by the Government. Assistance is not, we understand, given direct by the Ministry of Health.]

Plans and Specification.

SIR,—In reply to your correspondent "Perplexed," of Neath, where drawings and specification are at variance it is usual to decide in favour of the latter, provided both are contract documents and duly signed as such; as the specification should be a concise explanation of requirement indicated on the drawings.

A. E. FLOWER.

Croydon.

SIR,—Your correspondent, "Perplexed," quotes a striking instance in which a trifling 2½ per cent. appears to have been saved with after regrets.

A builder would naturally refer ambiguities to a supervising architect for his ruling, though when dealing with a layman he will choose the easier way.

The panels of a 4-panel door can be got out of single-width stuff, and so he wisely keeps quiet and makes the doors.

Where drawings and specification form the basis of the contract they each, in many respects, hold an equal authority unless the latter defines their "order of merit" or appoints a source of appeal.

I think "A" must make up his mind that in this case he has no redress, and must look upon the 4-panel abominations as a standing object-lesson as to the wisdom of putting such matters under the control of a trained man.

"ARCHITECT."

Cement Concrete Partition Slabs.

SIR,—In answer to "Query," I should consider that using good mortar and the best class of material, 4 in., 6 in. and 9 in. blocks may be safely used to the height and length of wall allowed in the L.B.A. or Model By-Laws for brick walls 4½ in., 9 in. and 14 in. respectively, taking into consideration a keyed bed and joint.

I should not personally build 3 in. work for a greater length or height than 13 ft. without intermediate stiffening. I look upon 2 in. slabs as suitable for small division walls, such as w.c. divisions about 6 or 7 ft. wide and high.

I should not use the 1½ in. slab for more than such small patches as stair spandrils, &c.

It is advisable in 3 in. and thinner work to carry a stud each side of a doorway up to the ceiling joists and secured to same, the portion up to door height having grounds nailed on each side to clip the slab. In cottage design, quite a pleasing feature can be effected in much the same way by carrying the door frames up to the ceiling as exposed timbers, the back of the frames being grooved out 3 in. wide to grip the slab.

These methods are a great source of strength.

Generally speaking, a doorway may be said to reduce the linear strength of a slab partition to about one-third that of a similar uninterrupted partition in walls of ordinary height (say 8 to 10 ft.) unless stiffened as suggested.

"CONSTRUCTION."

Brick-Making Machinery.

We are sure that Mr. Harrison, with the remainder of our readers, will appreciate that the gratifying popularity which this Bureau has so quickly gained, makes it necessary for us to limit the scope of these columns to matters of more general interest to the building fraternity.

Mr. Harrison will, no doubt, find little difficulty in obtaining his information through the usual channels.

THE MASTER BUILDERS OF ROME.

ETRUSCAN and ancient Roman architecture formed the subject of the first lecture of the Lent course given by Sir Banister Fletcher, F.R.I.B.A., at the Central School of Arts and Crafts, on January 16. He pointed out that Roman architecture proper covered five centuries (100 B.C. to A.D. 400) during the time when the world-wide Empire of Rome was at the zenith of her greatness. Then Italy was rich in building materials—white and coloured marbles of her own quarries, abundance of building stone and brick-earth for terra-cotta, granite from Egypt, porphyry from Greece, and all the glowing marbles from the coasts of the Adriatic and the Mediterranean. An expanding Empire, and a complex civilisation, gave birth to a variety of building needs, to meet which the Romans invented a new composite material, which was made up of broken stone and Pozzolana cement and poured like a household jelly into shapes and left to set. Then the wooden casing was removed, and the concrete remained hard and rigid. The invention and use of this material was the great outstanding fact in the structural aspect of Roman architecture; for this quality of rigidity made it possible to span great areas with domes and vaults of concrete. Thus these complicated types of buildings broke away from the simple trabeated style of the Greeks. This revolution in methods and plans opened the way for great utilitarian works, such as city aqueducts and cisterns, military bridges, public baths, and imperial palaces, some of which were allied to engineering undertakings.

These splendid Roman structures, often so complex in plan, were yet symmetrical, for they were planned on axial lines, which gave long vistas and an appearance of unity. The circular sweep of the Pantheon also showed that the old Roman architects could command, as well, the perfection of simplicity. Sir Banister laid stress on the composite origin of Roman architecture, for it was a union of the old native Etruscan arch and vault with the Greek column, to which the Romans added their own cross vault and dome. Above all, it was evident that their idea was not Art, but Empire—it was not so much to create a thing of beauty as to produce a lasting evidence of power.

LEGAL SECTION.

NOTES ON CURRENT CASES.

Building Estates and Restrictive Covenants.

A CASE was reported in the *Times*, December 22, Kelly *v.* Barrett, which raises questions of interest to those acquiring land on building estates.

The action was brought by Edward Kelly, Sir Spencer Maryon-Wilson being added as another plaintiff, against the defendant in the following circumstances: In 1877, Kelly and his brother, since deceased, were carrying on business as builders, and by an agreement, dated May 14, 1877, Sir Spencer had agreed to sell to them certain land on the east and west sides of Fitzjohns-avenue, and by this agreement Messrs. Kelly agreed to erect houses on the premises, and it was provided that the whole of the premises or separate plots should be conveyed to Messrs. Kelly or their assigns according to model forms of conveyances and be subject to certain restrictions and stipulations. Some 28 plots, including that on which subsequently the defendants' house was erected were conveyed to Messrs. Kelly, but others had been disposed of to subpurchasers who either had erected houses thereon, or had taken conveyances from the vendor after Messrs. Kelly had erected houses thereon, but all the conveyances were substantially in the model form, and the plaintiffs alleged that each subpurchaser was aware of the agreement of May 14, 1877, and of the restrictions and stipulations contained in it, and that they well knew that the restrictions and stipulations contained in the conveyances were intended by the vendor and by Messrs. Kelly to be for the benefit of all the plots and other land comprised in the agreement and that Messrs. Kelly and the sub-purchasers purchased upon that footing.

The conveyances to Messrs. Kelly of Nos. 40 and 42, Fitzjohns-avenue, the houses in question in the action, were substantially in the model form, each containing a covenant by Messrs. Kelly with the vendor, his heirs and assigns, owners for the time being of the site and soil of Fitzjohns-avenue (amongst other things), that no building other than buildings of a certain description to be used for private residences should be erected on the land, or when erected should be otherwise used.

In 1880, No. 40 had been conveyed by Messrs. Kelly to one Horner, subject to the above covenants and conditions, and the purchaser covenanted for himself, his heirs and assigns, to observe the same and to indemnify Messrs. Kelly against any breach. In 1881 No. 42 had been conveyed to one Harris on similar terms, and both these properties had since become vested in the defendant in this action, as the report says, "with notice of the restrictive covenants," but no other particulars are given.

The breach of covenant complained of was that the defendant had thrown the two gardens into one and converted the houses into a nursing home, and was so using them in breach as it was alleged of the covenants as to private dwellings.

The plaintiff Kelly was the owner of a large number of plots adjoining Fitzjohns-avenue, as to one moiety for himself and as to the other moiety as trustee of the will of his brother. Sir Spencer Maryon Wilson was the tenant for life of all the real estate of which his father died seized, and the plaintiffs alleged such real estate included the site and soil of Fitzjohns-avenue, and that they "or one of them" were entitled to the benefit of the covenants.

According to the report the learned judge stated that the plaintiffs had framed their case in three ways—(1) on behalf of the plaintiff Kelly it was said that the dealings by the Kelly's with the land they had bought from Sir Spencer were such as to constitute a scheme under which all the purchasers from them intended to contract with them and with each other to abide by the various stipulations which were imposed on the subsales, but the Court held on the evidence this view of the case could not be supported; (2) that each of the subpurchasers who took a conveyance directly from the vendor, had constructive notice of the agreement of May 14, 1877, and that notice of that agreement taken with the form of the conveyance was sufficient material upon which to infer the existence of a scheme whereby mutual covenants between such subtenants and the Kelly's were imposed. On this point the Court pointed out that there was nothing to show from start to finish either that the estate was ever intended to be laid out in defined plots or that the Kelly's were not free at any time after they had sold one or more plots to deal with the residue of the estate in any way they pleased, provided they could get from the vendor his consent to a variation of the original agreement, and the Court held that to give effect to this view contended for the Court would have to hold that each subpurchaser was willing to make himself liable not merely to the vendor, but to use the words of Mr. Justice Farwell in Osborne *v.* Bradley (1903, 2 Ch. 440) "also to unknown persons indeterminate and indeterminable in number in respect of plots of the particulars of which he knew nothing—that he had entered blindly into a bargain of which he could not possibly know the particulars," and there never had been a case where upon such indefinite material a scheme had been held to exist. The Court referred to Reid *v.* Bickerstaff (1909, 2 Ch. 305; *The Builder*, July 10, 1909), and held the material was too indefinite to constitute a scheme.

The third ground of claim related to a point for which Sir Spencer has been added as plaintiff as he claimed as tenant for life under the will of the vendor, but the Court found against this claim mainly on the ground that as the roadway of Fitzjohns-avenue had been taken over by the local authority, and as this would vest in that authority so much of the actual soil in the avenue as might be necessary for using it and maintaining it as a street (Mayor of Tunbridge Wells *v.* Baird, 1896, A.C. 434), the plaintiff could not show that the surface was vested in him or that he sued in respect of the estate and interest which belonged to his predecessor or that the restrictions touched such land as he now had, but the Court further intimated that even were this point not rightly decided, yet in such circumstances it would be oppressive to grant an injunction.

Possibly this case will be reported more fully subsequently in the Law Reports, when we shall be able to explain it further, for these cases of restrictive covenants in laying out estates are of considerable importance to our readers. All that we can say at present is that in the case Elliston *v.* Reacher (*The Builder*, September 2, 1908) certain guiding principles were laid down for application in such cases which may elucidate the findings in this case.

In the issue above referred to we summarised these principles, (1) Both plaintiff and defendant must derive title from a common vendor. This was the case in the case we are considering so far as the particular parties to the action were concerned, but it appears that parts of the estate had been sold by the Kellys and part by the original vendor direct, Whether this is material we need not now inquire, because the second condition laid down in Elliston *v.* Reacher was, (2) That previous to selling the vendor must have laid out the estate or a defined portion thereof, including the land purchased by the plaintiff and defendant or their predecessors subject to restrictions which, though varying in details, must be consistent in themselves and with a general scheme of development. . . . This principle as is shown by the judgment, was lacking in this case. The third principle was—the restriction must be for the benefit of all the lots sold, whether or not they were intended to benefit the land retained by the vendor; and the fourth was that both plaintiff and defendant must have purchased from the common vendor on the understanding that the restrictions were to enure for the benefit of other plots included in the general scheme. Here, as there was held to be no scheme it appears this principle could not be complied with.

In Reid *v.* Bickerstaff (see *The Builder*, July 10, 1909) the predecessors of the plaintiffs in the action had, in 1843, purchased land on an estate subject to restrictive covenants; the defendant's predecessors had in 1840 bought portions of the same estate from the same vendors, subject to similar covenants; other land had at various times been sold to other purchasers. There was nothing to show that the conveyance to the plaintiff's predecessors contained any reference to the conveyance to the defendant's predecessors or that the defendant's predecessors had any knowledge of the covenants entered into with other purchasers before their conveyance in 1840. The Court of Appeal held that the plaintiff had failed to show a building scheme involving reciprocal obligations between the purchasers, or that the plaintiff was entitled to the benefit of the covenants contained in the conveyance to the defendant's predecessors. We have not the full report of this case before us, but it seems a less strong case than that we are now considering, for here the conveyances were in one model form showing the existence of restrictive covenants, whilst there, there was nothing in the plaintiff's conveyance containing any reference to the previous conveyance to the defendant and thus principle (4) cited above was not complied with; all knowledge was absent.

We shall revert to the case we are considering if it is reported in the Law Reports.

Workmen's Compensation "Out of" the Employment.

The House of Lords, in the case Upton *v.* Great Central Railway Co., which we noted October 30, 1923, has unanimously reversed the decision of the Court of Appeal in which the majority of that Court had held that the accident in question had not arisen "out of the employment."

The applicant was the widow of a man who was in the employ of the respondents, and on the day he met with his accident was employed to go from his home station to another station on the line and from there go to work at a water main some distance from the station. It was admitted that his employment extended from the time that he left his home station until he returned to the same, and that the accident happened "in the course of" his employment, but the question was whether it arose "out of" it. He was returning from his work and had reached the station where he had to take train for his home station, and when the train came in he hurried across the platform and slipped and fell, injuring his knee, and septicæmia set in and he died. The platform was wet, but the arbitrator had found it was not slippery, and the majority of the Court of Appeal held that the accident did not arise "out of" the employment as there was no special risk of location and no causal connection between what the workman was employed to do and the accident. We may here mention that in our former note the word "causal" was accidentally printed "casual" in two places.

The House of Lords has now reversed this decision, but at present only one of the opinions delivered by the House is reported (*The Times*, December 19).

Lord Haldane, who delivered that opinion, is reported as having said that although some causal relation with the employment must be shown, that need not be a direct or physical causation. If there had been a hole in the platform that would have been an illustration

of direct or physical causation, but the statute does not prescribe such causation, and the right given is not dependent on negligence on the part of the employer, but is in the nature of insurance against injuries by accident provided they arise out of the conditions on which the man is employed; thus the only kind of causation that is demanded is that the accident should have arisen out of the man's fulfilment of those conditions. In other words the statute by its language requires the Courts to interpret the kind of causal connection required as satisfied where the accident has arisen out of what the workman had to do because of the conditions of his employment as distinguished from being directly physically caused by it. Lord Haldane then, having thus defined the causal connection, said it was not easy to lay down with precision how far such conditions may extend; the mere fact that they have arisen in the course of the employment is not sufficient, but if in the course of his employment the workman meets with injury by accident which has arisen directly out of the circumstances encountered, because to encounter them fell within the scope of the employment, compensation can be claimed.

Lord Haldane also pointed out that if the accident occurred from carelessness that afforded no bar to the claim, for serious and wilful misconduct is the only bar, and where death or permanent disablement ensues from the accident that is also no defence.

We do not know when all the judgments are reported if any more definite principle can be extracted than what we have summarised above from Lord Haldane's judgment, for it will be seen it seems as difficult as ever to read the expressions "in the course of" the employment and "out of" the employment so as to qualify the first by the second, if so wide an interpretation has to be given to the Act as that laid down in this judgment.

The following cases were referred to in the judgment as supporting the view expressed in it: Thom *v.* Sinclair (1917, A.C. 127; *The Builder*, June 22, 1917); Dennis *v.* White (1917, A.C. 479; *The Builder*, October 26, 1917); Stewart *v.* Longhurst (1917, A.C. 257; *The Builder*, April 6, 1917); and Davidson *v.* McRobb (1918, A.C. 757; *The Builder*, August 2, 1918). These are all cases in the House of Lords, but the Courts have not found it easy to draw any certain principle from them. They were considered in this same case when before the Court of Appeal, and the majority of that Court came to a contrary decision to that now delivered in the House of Lords, and it must be remembered that in the very recent case, St. Helen's Colliery *v.* Hewitson (*The Builder*, December 7, 1923), where the question was whether a man had been injured "in the course of" his employment, Lord Shaw of Dunfermline strongly dissented from the opinion expressed by the majority of the House.

In our note on the case we are considering, when decided by the Court of Appeal, we thus summarised what we considered to be the effect of the cases, Thom *v.* Sinclair and Dennis *v.* White: "If a workman whilst performing the obligations of his employment, incurs a risk which the conditions of that employment involve and sustains an injury from that risk, the accident arises 'out of' his employment, and that whether the risk is common to mankind or not."

In the light of the decision now delivered in the House of Lords, this summary of the law, which we based on those two cases, seems to require alteration, as it is now too narrow, and the word "risk" must at least be left out, for, according to Lord Haldane's judgment, the Act amounts to an insurance, not against the risks attending the employment, but against "injuries by accident" arising out of the conditions under which the man is employed, and thus the summary should now read, "If a workman in the course of his employment, whilst fulfilling the conditions of his employment, that is, doing what he has to do because of the conditions of his employment, sustains an injury by accident, the accident also arises 'out of' the employment." We have added the words "doing what he has to do," because of the decision of the House of Lords in St. Helen's Colliery *v.* Hewitson, for in that case the majority of the House held that the accident did not arise "in the course of" the man's employment, because, although he was in the train under a recognised right and by arrangement with his employers, yet it was optional for him either to use the train or to arrive at his place of work by any other means he chose.

The facts of the cases referred to by the House of Lords in giving the decision in Upton's case will be found very briefly summarised in our note on that case when heard in the Court of Appeal (*The Builder*, October 26, 1923), and in our note on St. Helen's Colliery *v.* Hewitson.

THE RENT ACTS.

Statutory Tenant's Right to Assign.

IN two cases recently appealed, Keeves *v.* Dean, and Nunn *v.* Pellegrini (1923, 2 K.B. 804), a question was raised under the Rent Act, 1920, upon which it was said there was no direct decided case. That question was whether a tenant who has received notice to quit, but who retains possession as a statutory tenant, has the right to assign the premises?

The facts of the two cases as reported in the Divisional Court in the *Law Reports* are as follows:—In Keeves' case the plaintiff Keeves was the owner of a house at Thornton Heath, and in April, 1919, he had let the premises to one Beach as a weekly tenant. There was no written agreement, and in August, 1922, the plaintiff had given Beach notice to quit, but he remained on as a statutory tenant. On January 5, 1923, the plaintiff received a letter from the defendant Dean's solicitors, stating that by an indenture dated January 3, 1923, Beach had assigned the premises to the defendant. The defendant was requested to vacate the premises, but he declined, saying the assignment to him was regular, and the plaintiff brought this action to recover possession.

The facts of the second case are very similar: there was a letting of the premises to one Stebbings on a weekly tenancy. In May, 1920, notice to quit had been given, and the rent was increased within the statutory limits. In the letting there was no prohibition against assignment, but in the later rent books there was a prohibition against sub-letting. In December, 1922, the goodwill, stock and fixtures of the business carried on by Stebbings had been sold, and it was part of the bargain that Stebbings' interest in the premises should be transferred to the defendant, and on the sale being completed Stebbings had erased his own name from the rent book and inserted that of the defendant. The plaintiff had refused to receive rent from the defendant, and in March, 1923, the plaintiff brought this action against the defendant, claiming possession and damages or mesne profits. In the first case the County Court judge had made an order for possession, but in the second case the judge of a different County Court circuit had held the defendant was entitled to judgment.

The Divisional Court had reversed the decision of the County Court in the first case, and affirmed the Court in the second case, thus holding in favour of the statutory tenant in both cases. The decision mainly turned on section 15 subsection (1) of the Act of 1920, which provides "A tenant who by virtue of the provisions of this Act retains possession of any dwelling-house to which this Act applies shall, so long as he retains possession, observe and be entitled to the benefit of all the terms and conditions of the original contract of tenancy so far as the same are consistent with the provisions of this Act. . . ." The Divisional Court held that as at common law a tenant has a right to assign his interest unless he is precluded from doing so by the terms of the contract of tenancy, and as it had been held in Parkinson *v.* Noel (1923, 1 K.B. 117; *The Builder*, December 8, 1923), that a statutory tenant's interest is "property" within the meaning of the Bankruptcy Act, 1914, section 167, and therefore not a mere personal right, the statutory tenant, unless precluded by the agreement of tenancy, could assign his interest, and there was no provision in the Act contrary or inconsistent with such a construction.

In Nunn's case also a point was raised that the assignment must be under seal, but the Divisional Court approved the finding of the County Court judge that although the assignment of the statutory tenant was not under seal, yet upon the facts proved a Court of Equity would grant specific performance and would direct a formal deed of assignment to be executed.

The Court of Appeal has now reversed this judgment of the Divisional Court (see *The Times*, December 20), but it must be noticed that the decision relates to assignments only, the question of sub-letting being left for decision in a case where that point arises.

The Court referred to section 15 subsection (1), part of which we have set out above, and pointed out that in two cases, Remon *v* City of London Real Property Company (1921, 1 K.B. 49; *The Builder*, February 11, 1921) and Cruise *v.* Terrell (1922, 1 K.B. 38; *The Builder*, April 21, 1922), it had been decided that a person who is in possession by virtue of the Statute only, is a tenant within the Act, and held that the right to assign is not a condition of tenancy, for the right to assign is a right incidental to an estate, but the right conferred on a statutory tenant is a personal right which cannot be assigned unless the Statute authorises it. Having thus laid down the principle, the Court then referred to subsection (2): "Any tenant retaining possession as aforesaid shall not, as a condition of giving up possession, ask or receive the payment of any sum or the giving of any other consideration, by any person other than the landlord" under penalties described in the subsection, and said that the two subsections showed that when in subsection (1) the legislature used the words "terms and conditions of the original contract of tenancy," it was clear the words were used in their strict legal meaning, and the conclusion to be arrived at was, reading the two subsections together, that a person remaining in possession under the Act after the expiration of the term has no right to assign the premises.

It will be seen that the question is a difficult one, and we may revert to it when the case is reported in the Law Reports, but the decision is definite that a statutory tenant holding over after the determination of an agreement, such as those before the Court, with no provision allowing him to assign in the agreement of tenancy, has no right to assign.

If, however, the contract of tenancy did contain license to assign it might still be a question whether under subsection (1) that was not a "term and condition of the original contract of tenancy" to the benefit of which the statutory tenant would be entitled, for that question was not before the Court.

Therefore, it is very important to note that the Rent Restrictions Act, 1923, in section 4 subsection (1) paragraph (*h*) has a provision dealing with this matter. That paragraph provides a new ground upon which an order for possession may be made, that is where "the tenant without the consent of the landlord has at any time after July 31, 1923, assigned or sublet the whole of the dwelling house or sublet part of the dwelling house the remainder being already sublet." The only question, therefore, which can now arise is what meaning is to be attached to the words "without the consent of the landlord." If the lease or agreement of tenancy contained a license to assign or sublet, would that be a term or condition of the contract of tenancy under section 15 subsection (1) to which the statutory tenant is entitled "so far as the same is consistent with this Act," and therefore amount to a consent under paragraph (*h*) of the new Act, or must special permission be asked and obtained? We imagine that it would be held that where the tenancy agreement permits assignment, the statutory tenant can avail himself of the license, but at any rate one point is clear which, as we have said, was specially reserved in the above decision, for the Statute places assignments and sub-letting on the same footing.

INDUSTRIAL ART.

BY REGINALD HALLWARD.

Two events, each of them directed to the improvement of the standard of industrial art at the present time, both of them of more than usual importance—the one promoted by the Royal Society of Arts and the other by the London, Midland & Scottish Railway Co., have already called forth a considerable amount of notice. In the case of the first, the Society of Arts, in order to encourage the study of design for industrial purposes, have decided to hold annual competitions. The first of these will take place in June, 1924, and will be open to two classes—(*a*) students in British Schools of Art, and (*b*) all British subjects. The competition is divided under the following heads:—(1) Architectural Design, (2) Textiles, (3) Furniture, (4) Book Production, (5) Pottery and Glass, and (6) Miscellaneous, from which it is seen that the scheme covers a wide field. The Society will confer its Diploma on any candidate whose work shows exceptional artistic ability and practical knowledge of the materials and processes of his trade. After the awards, by permission of the Director, the designs will be exhibited at the Victoria and Albert Museum. Under the title of "Miscellaneous," two firms offer prizes for designs for chocolate boxes. The L.M.S.R. scheme takes the form of commissions to members of the Royal Academy to design posters of places and industries on their line. Many of these posters are already nearly complete, and as many as 17 Royal Academicians are engaged on the work. The suggestion of this movement came from Mr. Norman Wilkinson, whose poster work is well-known, and no pains will be spared in their reproduction in order to secure the best result. In regard to this scheme it will be of interest to quote a passage from an article in a contemporary on the subject in which it is stated: "The artist is the very man that we require more of in our social swirl of routine, catchword and claptrap . . . And the Academician going out into the highways should not only find his work, but find himself." From which it would appear that he has not already found himself, to which perhaps Academicians will have something to say.

We are glad, however, to see the good example set by the Underground Railways being followed by other companies. For the success of the former has not been only that it has sought to improve advertising—for which good intentions are insufficient—but that it has shown so much judgment in the choice of suitable material, avoiding the over-pictorial, and touching advertising with the lightness and buoyancy which fits its more, or less, ephemeral character. We have only to think of the enchanting alphabet known to travellers by the Underground, and the more recent and provokingly droll little poster, called "Theatreland," to see that the Underground enters into the genius of the art, which is not to load us with ponderous and realistic scenery, printed in a great number of colours, but touch it all with the magic wand of gaiety, brightness, humour, and with treatment adequate to these. This—though we do not praise everything—they have done in a way that is deserving of thanks from all who use their system of railways. We are at moments afraid that the Midland Company are relying on the prestige of certain artists, instead of the applicability of their work, and it was in avoiding the mistake of this more conventional attitude that the Underground was able to go straight towards success, and it would not be too much to say that they have created advertising through this independence of choice. So that, when we hear of Scotch scenery, and think of the peril that lochs and lakes are to the artist, we are anxious to encourage a direction in which fancy is more than fact, art more than nature, and genius more than reputation. In justice to the artists who have done such good work already, we may add that Academy rank is no greater assurance of improved industrial design than the work of other good artists who have been pioneers in the movement which has preceded theirs. We welcome and look forward to seeing these Royal Academy posters, many of the members not having before done a poster; but when reports state that "a great move forward in industrial art is to be expected," we see no reason to think that the enterprise which has done so much for industrial art in the case of the Underground Railways is going to be left behind. We want to make this clear, while welcoming the Academy contribution. From what we read of the intentions, the Midland Co.'s scheme is not unattended with dangers. "Mr. Wilkinson," so we are told in the *Observer* account, "was evidently delighted with the subject. The L.M.S. lines, he pointed out, run through the loveliest scenery in the kingdom—the mountains of Wales, the Mediæval Border, the wildly beautiful Highland glens and forests, the glens of Antrim, and the great loughs of Ireland," and so on. But realistic portrayals of Highland glens can be very dismal things, and the traveller, so it seems to us, in his minutes of waiting for the train, would prefer something else, something that arrested by its unexpected whimsical character, that had genius and personality to beguile us through impressions drawn from art rather than local scenery. And what we are concerned to point out here is that lightness, fancy and personal vision are better than pictorial landscapes of glens and lakes. The advertisement is by nature of its situation and purpose more or less ephemeral, and should be touched with the lightness which such a use connotes; this does not preclude a fine sense of design and treatment, but directed to its purpose and place and the limitations which such imposes.

It may be suggested in reply to this that the mediæval period brought art into the daily life, touching it everywhere, and that there is a sort of parallel in this introduction of academic art to advertise railway travelling. On the other hand, there will be those who see danger to art in the artist being brought more and more within the orbit of industrialism, and that the nature of his vocation may be sacrificed to it. We do not say this is the case, but some will doubt—there will yet remain some who find another scope for art, which is not included in industrialism, as the expression through beauty of the highest religion and noblest truth. We are not deprecating industrial uses for art—far from it—but are wishing to keep before the public those other aims for art which industrialism obscures. Is there not some parting of the ways for art disclosed through present issues? which reveals the craftsman on one side absorbed more and more into industrial art, and finding through it his scope, and on the other the pursuit of beauty by the artist for itself, trusting the inspiration of his high vocation in a world more occupied in material wants, and so to raise and purify it. This appears to us at such a time to need saying lest we forget the larger issues of life for mere "meat and raiment."

We have already commented on the proposals of the Royal Society of Arts, and while in no way deprecating any steps which may improve industrial design, we are unable to forget that this is only one more of a very great number since the time of the Great Exhibition of 1851, directed towards that end. It must be remembered also that the deterioration in our industrial standards of craftmanship has in many ways progressed since that time. Such schemes, under one guise or another, are hardy perennials which have not yet led to that decisive improvement hoped for.

We yield to none in our desire to see improvement, but does it lie in craftsmanship alone? Can the problem of industrial art be solved through giving diplomas, or because seventeen Academicians design posters for the railway stations? No doubt great changes are foreshadowing themselves as the result of the war, but have they penetrated through all ranks of society to seek new and better ends for industry raised above the war of industrial competition to seek beauty as an end in itself? Yet something like this must ensue before the industries of the country can be again stamped with authentic beauty. Are we quite whole-heartedly seeking beauty for our industries, or are we proposing to make use of it for our commercial purposes, to push our sales? There is a world of difference between the two, and we shall find what we seek.

There is yet another thing which must also be considered when we are showing so much concern for the needs of industrial art. There is only art, there is not industrial art and some other; nor is art necessarily of a character that would be at once understood and appreciated by the general public. Every artist knows that this is a negation of the nature of art, which asks something from us as well. We cannot have it both ways. What art is this that is to be secure of appreciation by the public as a condition of itself? For it suggests there is some other art which the public may not like so well. Are we making terms with art on the basis of our pockets or our hearts? For we need to look at things as they are, not as some of us would wish them to be. Will the Royal Society of Arts award its diplomas to art or to the art the public is supposed to like? For they may not be the same. We would not be misunderstood: given good design, the public would in time appreciate it. But the thing we are all needing is to believe in beauty for itself; and it is this grand amelioration we await, and industry awaits, and when this deliverance comes we shall awaken to a new world.

The danger is lest we should appear to be doing something when we are not really doing it. We are anxious to encourage industrial art, but is the artist, when we have him kept in full use of his abilities in the best way? We pursue the shadow so often for the substance—encouraging art, industrial or other—while the artist is seldom fully employed. It is worth while thinking of these things when regarding new schemes for improving industrial art, because they lie as the foundations of any possible success. For it is not that beauty is far off from us, but that we are far off from it, through an outlook with which the industrial era has accustomed us; in which expediency, and worldly wisdom, and the power of money—to which beauty will never yield—have ruled over us. And so, though welcoming all efforts directed towards the improvement of industrial art, we speak here of what must also not be left undone, if we are to disentangle life from the half-truths and expediencies under which we live. It may be that we have yet to plough our feet through deeper loss and suffering before there returns that belief in the good and the beautiful which directs us to trust it before aught else and for its own sake; but when that time comes we shall rely less on diplomas to restore to industry the beauty—the want of which we feel—because it will then have become what all our hearts desire.

The Wren Society.

This society, which was founded shortly after the Bicentenary Celebrations of February, 1923, for the purpose of publishing the drawings of Sir Christopher Wren and other documents throwing light on his work, has now in hand a portfolio to contain the drawings of St. Paul's in the All Souls' Collection, which will be issued with explanatory text as early as possible this year. It is hoped that many who have not already joined the society will avail themselves of the opportunity of doing so now, since wider support will be needed to enable the society to extend its activities to other subjects and other collections. Matter is abundantly available, but must remain little known till it can be reproduced. The annual subscription is one guinea, and subscribers will receive annually a portfolio of from 20 to 25 collotype plates with text. The Hon. Sec. is Mr. W. H. Ward, 2, Bedford-square, W.C. 1.

THE BUILDING TRADE.

COST OF BUILDING MATERIALS.

THE report for November and December, 1923, of the Inter-Departmental Committee appointed to Survey the Prices of Building Materials, states that the most appreciable fluctuation to which attention need be drawn is the price of lead between October and November, 1923. The general rise in price mentioned in the October report was still further accentuated, and in the majority of districts included in the schedule the November prices show an increase of approximately £6 or £7 per ton. Timber appears to be somewhat easier in price in London and Edinburgh. The price of bricks and cement remains generally at the same level; there has, however, been an advance of 2s. a thousand in common bricks at Swansea, and a fall of 2s. at Edinburgh. From Manchester, where a fall of 5s. a ton in British Portland cement was shown in October, a further drop of 2s. is reported. There has been no change in the price of light castings. There have been a number of local fluctuations in other materials, but no general move in either direction.

There has been practically no change in the level of prices between November and December, the one point mostly of note being a fall of 6s. 2d. a thousand in facing bricks at Dundee.

MESSRS. WALTER LAWRENCE & SON, LTD.

ON the occasion of Mr. Walter W. Lawrence's majority, the staff of Walter Lawrence & Son, Ltd., were entertained to dinner at the Great Eastern Hotel, on Tuesday.

After the loyal toasts had been honoured, Mr. W. A. Ward, in proposing "Mr. W. W. Lawrence," presented him—on behalf of the staff—with a gift of silver as a mark of their appreciation.

Mr. W. W. Lawrence, responding, said he hoped to be in touch with them in the future. As they had known him years ago, he hoped they would be content to know him then. In spite of the troubled times of commerce, he trusted the foundations of friendship would last for many years to come.

Mr. B. T. Rice Pyle then proposed "The Architects and Surveyors." Messrs. Victor Wilkins and J. M. Theobald responded.

Sir Walter Lawrence, in proposing "The Staff of Walter Lawrence & Son, Ltd.," said no firm could succeed without a loyal staff, and, it was interesting to know, that several members had served for over twenty-five years—hard work seemed to agree with them. They were the men who had stood by the firm and brought it to its present position.

Mr. W. L. Thorpe, responding, presented to Sir Walter Lawrence, as a mark of their appreciation, an address signed by the whole of the staff.

Sir Walter, in a brief reply, said the address was totally unexpected, and he was pleased to think his treatment of the staff had been appreciated.

NEW BUILDINGS IN LONDON.

FLEET-STREET RECONSTRUCTION.—Messrs. B. Colley & Sons, Ltd., builders, of 135, Portland-road, W.11, are reconstructing 144, Fleet-street, the reconstruction and alteration consisting of gutting out the whole of the floors from top to bottom and the roof, and underpinning the party wall between 114 and 113; also new concrete floors in the basement and to the shop. Messrs. Seigwarts have put in their patent concrete reinforced block floors. The Empire Stone Co. has built new stone stairs from the basement up to the top of the house.

MODERN BUILDERS' MACHINERY.

BY STAFFORD RANSOME.

III.—SECOND-HAND PLANT.

IN the last article the very wide range of makers of machinery from whom the builder may make his selection and the difficulties in arriving at a sound decision were discussed, and a certain policy for purchasers recommended. Here it is proposed to deal with the problem of second-hand machinery, which often plays an important rôle in the building industry, especially with young firms who are beginning to launch out.

There is always a considerable amount of second-hand builders' plant floating about the country, mostly in the hands of dealers, and the rest is to be found at auctions or in factories which have ceased work where the owners prefer a private sale to an auction. Just now there is an unusually large amount available, as there are hundreds of machines that were used for rush work during the war and whose functions ceased when the war ended, and the large surplus Government stocks that were never used, and which have not even yet all been absorbed.

Let me say at once that in the abstract I am no believer in the adoption of second-hand machinery as a principle. At the same time there is a very large trade in second-hand plant, and in it the smaller builder is a large purchaser and is not infrequently to be found as a seller. He is a purchaser for a variety of reasons: The low cost may appeal to him; he may be in a hurry and cannot wait for new machines; he may see just what he wants, or thinks he wants, in the way of second-hand plant ready for his use just at the right time; he may want machines temporarily and consider that second-hand plant may suit him for the purpose. He becomes a seller because: His business may be expanding and he discards his combined machines of the "general joiner" or "universal wood worker" type in favour of separate machines; he may have been only a temporary user of machines; he may be going out of business; he may realise that he has bought a bad plant and wants to get a better one. Second-hand machinery, then, is a serious factor in the trade and, while the idealist may scoff at it, it cannot be laughed off or ignored, for it is there, good or bad, a real thing which must not be passed over lightly as of no account.

Nothing that can be written against it will stop or even discourage it, and after all the chance of making a wonderful "bargain" is often irresistible to many purchasers. To the purchaser who has a thorough knowledge of wood-working machinery and has an opportunity of carefully examining the plant before purchasing the risk is not great, but to anyone else the danger of making an appallingly bad bargain is evident. In a previous article I emphasised the point that the best machines are the cheapest. Well, second-hand machinery is seldom likely to be the "best," even if it is of good make and in good condition, but it may well be that a second-hand plant by a good maker will prove itself to be infinitely better than a cheap new plant. On the other hand there are many second-hand machines which have the appearance of being "as good as new" which are virtually worthless. A pot of paint will do wonders in making an old machine look presentable. On the other hand some machines which appear, and actually are, nearly new may also be worthless, because, owing to some inherent fault in their design or construction, they were wrong from the start. Such a defect may not be noticeable to any but an expert until the machines are in operation.

If a purchaser of second-hand machines is himself an expert and a millwright, and can afford the time to look around and wait for what he wants, he can sometimes equip himself eventually with a second-hand plant which will answer his requirements quite well after he has put the machines in working order himself. Many builders in a small way have started on these lines, and some have gone on doing so and, in fact, have made a hobby of it. Personally I do not consider the game is worth the candle, because the waste of time involved in the process is very considerable, and although the machines may have been made "as good as new" some of them assuredly will be somewhat out of date.

In trying to avoid the pitfalls that lie in the path of the purchaser of second-hand plant let us analyse the stuff those machines are made of.

Long-Lived Machines.

One often hears a saw-mill owner say that a certain machine of his, after working for twenty years, is "as good as new." Only recently I saw a letter from a man, well known as a saw-mill authority in India, stating that a saw-frame which had been running there for twenty-eight years was still in perfect condition, and he gave as its present output a rate that was at least equal to that of a good log frame made to-day. This is due to three causes: (1) The machine was by a first-rate maker; (2) it had been looked after intelligently; and (3) there has been no material increase in the outputs of general purpose log frames or drastic alterations in their construction since that date. The best makers in those days erred on the side of heaviness in their machines, and the materials they used, though not so scientifically apportioned, were always good. This all tended to longevity, and there is no reason why a frame saw constructed a quarter of a century ago should not be virtually as good to-day as it was when new, provided that it has been intelligently used and had its wearing parts renewed from time to time. Nor is there any reason to scrap it in favour of a new log frame, for the new one would not give an appreciably larger output or a better quality of work.

The steady slow-going log frame is almost alone among wood converting tools to which the above condition may be said to apply, for although the above period is by no means an extraordinary lifetime for a wood-working machine of almost any type, if properly made in the first instance and carefully treated, and although there are thousands of them other than log frames of that age working to-day as well as they did when they were put down, they are nearly all out-classed by more modern machines which do better work at higher speeds. Not only that, but to-day they are much more scientifically made, stresses are dealt with theoretically, all unnecessary material is eliminated from the working parts, spindles are accurately balanced, feeding gear vastly improved, and ball and roller bearings have at once, by greatly reducing friction and the amount of lubricants consumed, lowered the driving effort.

Users of wood-working machinery proverbially hang on to their machines far longer than they should, for it is merely a truism to say that a machine is obsolete as soon as there is a better one to replace it. Thus it is that in normal times second-hand machines do not, as a rule, come on to the market in any large quantity, except from some accidental cause, until they have long been obsolete in comparison with new machines, or until they have been used up or damaged, or unless they were originally bad. This makes the purchasing of second-hand plant a very dangerous proceeding to the tyro.

Obsolete Machines.

One cannot, of course, place even an approximate date as to when a particular class of machine becomes obsolete, but we may take it as a general rule that with the exception of the log frame and possibly one or two of the simpler machines, such as a plain saw bench or plain lathe, no second-hand machine that is anything approaching ten years old is worth buying at any price, and nothing in the shape of an automatically fed machine, either in the form of a planer or a saw, is worth considering after it has been in use for much more than half that period; not necessarily because it is worn out, but because there are far better designs to be had to-day. This computation, rough as it is, can only hold good when it is a question of a choice between second-hand machinery and the best new machines that can be got. If the choice lies between second-hand plant and cheap new stuff, whether in the form of Continental machines or those made by certain firms here who cater for the cheap trade in competition with the Continental firms, it is quite possible that a ten-year-old plant by a good manufacturer will be far the better proposition of the two. The reason for this is because the cheaper machines do not, as a rule, contain the latest improvements and their construction is liable to be faulty.

A point to be borne in mind when purchasing second-hand plant is that if it is in such a condition that much money has to be spent upon it to make it "as good as new" most or all of the advantages in purchasing it at a low cost are done away with.

The proper people to renovate a second-hand machine are the firm who made it. Their price may be higher than that of a local millwright, but the latter may have but little experience in wood-working machinery, and if it is a question of replacing broken or worn-out parts there is no one but the maker who is likely to have in stock the required exchange pieces. Besides this, the maker whose name is on the machine will assuredly make a good job of the renovation or refuse to undertake it, as his prestige is at stake.

A Machine's Past Life.

One of the most important things to ascertain when purchasing second-hand machinery is its past history, and the first item to find out is the maker. If it is by a well-known manufacturer the name will be on it. If there is no name, or if it bears the name-plate of some factor instead of the actual maker, there is some reason for it. Even a factor does not remove the name of a reputable firm, because it is a guarantee that the machine is, or ought to be, a good one. Still less does the second-hand dealer do so, because a good maker's name may quadruple the price that he can get for the machine.

The next most important thing to ascertain is the age of the machine. With the maker's name it should not be difficult to find this out, especially if it is known where the machine has been working, as there is probably a record in the maker's books. At all events, a representative of the maker will easily be able to date its birth within a year or two if he has an opportunity of inspecting it. It is usual for the maker to cast his name on the machine, usually on some part of the main standard.

The safest way to buy a second-hand machine is from a factory which is about to stop, or from which the machine is about to be removed, because then the purchaser or his technical adviser can see the machine at work and examine the quality of the work done by it. It is not often, however, that this is possible, as the machines are seldom put on the market until the factory has stopped work.

By far the cheapest market in which to buy second-hand plant is the auction room, for here good machines will sometimes be sold for a twentieth or less of their value though often rubbish will fetch as high a price as good machines. For this reason it is a very risky business unless the purchaser has had a previous opportunity of fully examining the machines. When such is the case, if the machinery is good and what is wanted, it would be better to buy it in before the sale if you can get it at your own price. It is possible that at the auction you might buy it cheaper, but then you must risk the chance of someone else getting it.

Quite recently I had to advise on the purchase of a plant for making a certain special article. The machines were in a factory which had given up work, and this special plant, with the rest of the property, was shortly to be put up to auction. I inspected the plant, recommended its purchase at a certain price, which was accepted by both parties, and the goods were withdrawn from the sale. Here my work ended, but it transpired that in error one of the machines concerned had not been taken out of the sale and was knocked down to a dealer for a few pounds. When the mistake was discovered the dealer was located and his price was five times that amount. Big as was the profit, it was a legitimate one as he had taken a big risk, for he might have had to hold it for a long time; but the machine was a good one and worth certainly three or four times the dealer's price to the man who wanted it.

Buying second-hand machinery from a dealer is the easiest procedure for the man who is in a hurry, because, by looking round the dealers, he may get a fairly wide selection of machines. It is also the easiest way of falling into a bad mistake. When this policy is adopted, however, it is safer to purchase from a dealer who sells his machines in the condition in which they were when he bought them, without, that is to say, any attempt to make them "as good as new." With the former, if we have an opportunity of inspection and are conversant with these machines, we, at all events, know the worst at once, and can form our own estimate as to what the repairs will cost. The price, too, will be comparatively low. With a dealer, however, who makes a practice of renovating the machines he buys and selling them as in good working order, if not new, we are facing a much more risky proposition. To begin with his price will be within measureable distance of that of a new machine. Quite possibly he has honestly tried to put the machine in good repair, but his one and only object is to make the machine presentable for sale at a good price, and he spends as little money in the process as possible. We must further bear in mind that, with all the good will in the world to do the work thoroughly, he cannot do it as efficiently as it should be done if there are any complications involved in the process. Essentially is this the case where anything in the shape of an elaborate machine is concerned, such as a four-cutter planer or a general joiner. Nor is such a man going to order and fit special exchange parts which may be necessary to the proper renovation of a machine. Further, whatever his knowledge of machinery repairs may be, he is not an expert in all sorts of machinery, and wood-working machinery is intended for high-speed and delicate operations, and all repairs to it, as above explained, should be done by an expert, preferably by the maker of the machine.

Apart, however, from the conscientious dealer, there are others whose renovations consist solely in camouflaging defects, and some of these dealers are extremely ingenious in their methods. Quantities of vamped-up and very bad wood-working machines are made presentable by such dealers and are readily sold, and it is in this trade that the worst bargains are made from the purchasers' point of view. In short, if you buy second-hand machinery from a dealer, buy it in the rough, and see to its being put in workable order by someone of your own selection.

Characteristic Deficiencies.

Now I will endeavour to summarise the points which are most likely to cause trouble in second-hand plant. Some of these may be fairly obvious, but others are sometimes difficult to locate at the time of purchase.

(1) It is seldom that a second-hand machine, however good its condition may be, unless it is nearly a new one, will give as good results in output as a new machine, as types change and improvements take place frequently.

(2) It will be less convenient to handle, because the arrangement of spindle, feeding gear pressures, &c., has improved greatly during recent years.

(3) It may, and probably will, have solid bearings which are out-of-date for wood-working machinery to-day for anything except perhaps a saw frame.

(4) Its bearings in any case will probably require renovating or replacing, and if the spindles are badly worn they, too, will have to be replaced.

(5) The gear wheels and racks are almost certainly worn and require replacing. Very possibly they are of cast iron instead of cut out of the solid. This causes them to work jerkily, makes them noisy and absorb more power.

(6) The tables of saw benches and, worse still, of planing machines may be worn out of truth, and will require either replaning, replacing, or the machine may have to be thrown out.

(7) In four-cutter planers there may be no replaceable sectional tables to facilitate replacing when worn.

(8) There may be no provision for withdrawing the bottom block from a planer for adjusting the cutters.

(9) Spindle headstock fences, sliding parts and lathe centres may have been worn, or jarred, out of alignment.

(10) Cutter-blocks may have been knocked about and thrown out of balance and must be replaced or at all events re-balanced.

(11) The pins and collars or sleeves forming articulated joints will almost certainly be worn, thus producing "back-lash" and jerky movements.

(12) Hand-feed planers will almost certainly be unprovided with the circular blocks now required by the Home Office regulations.

(13) The guards and other safety appliances will probably not accord with these regulations.

THE WEEK IN PARLIAMENT.

Westminster, *Wednesday.*

Defence of the 1923 Housing Act.

During the debate on the Labour Party's motion of "No confidence," which began on Thursday, January 17, Sir Wm. Joynson-Hicks, the Minister of Health, said that, although the Housing Act of 1923 had been in operation for only five months, he had already approved plans for the building of 85,036 houses. Of that number 31,000 were to be built by the local authorities and 53,600 by private enterprise.

Already, under the 1923 Act, contracts for 44,000 houses had been made; 17,600 houses were in course of erection, and 3,500 had been completed. All this had been done in five months. He prophesied that there would be built in the first year after the passing of the 1923 Act no fewer than 100,000 houses. That number would be greater than the number built in any year during the last twenty years, except in one year, when 105,000 were built. The average annual pre-war figure was 63,000. In addition to the 85,000 he had mentioned, he was every week approving over 3,500 further houses. The best year under the Addison scheme only produced 88,900 houses. In 1901 there were 101,000 bricklayers, and to-day there were only 53,000. There were 27,000 plasterers, and to-day there were only 13,000. There were 8,400 slaters, and to-day there were only 2,880. There was practically no unemployment in the skilled sections of the building trade to-day. Of bricklayers there were 1.6 per cent. unemployed, of plasterers 3.5 and of slaters 4.9. He had been asked at the Ministry of Health by nearly every town in the country for more slaters, more plasterers and more bricklayers. He had had demands from local authorities who desired to build more houses, but who could not build more houses.

Sir W. Joynson-Hicks said, as regarded the skilled operatives, there was ample work in sight for them, and for at least 25 per cent. dilution for the next ten years.

Mr. D. G. Somerville, on the previous day, said the reason why too few houses had been

built was because of the shortage of bricklayers and plasterers. Why were there no bricklayers and plasterers in this country? Because, after the war, owing to the Socialistic doctrines which impregnated them, the trade unions did not allow any dilution of building labour.

Houses Built.

Sir Wm. Joynson-Hicks informed Mr. A. T. Davies that during the year ended December 31 last, apart from houses built by private enterprise without subsidy, 19,185 houses were completed in schemes approved under the Housing Acts of 1919 and 1923, and on January 1 last 18,975 houses were under construction.

Vacant Houses.

Mr. W. Adamson asked the First Commissioner of Works the number of dwelling-houses under the control of his department which were now vacant.

Sir J. Baird said that out of a total of 9,763 houses managed by his Department, 172 were void, over 75 per cent. of such houses being in Barrow and Invergordon; 149 houses were available for re-letting, but owing to the industrial conditions, especially in those two areas, considerable difficulty was being experienced in finding tenants. Only 23 houses out of the total of 9,763 were being held for sale, and in the event of there being no sale within the short period allowed by the Department, they would again be offered for letting.

Smoke Abatement.

Sir Wm. Joynson-Hicks informed Sir H. Brittain that it was proposed to reintroduce the Smoke Abatement Bill and he hoped it might be found possible to secure its passage into law during the present Session.

Light on the Cenotaph.

Colonel Vaughan-Morgan asked the First Commissioner of Works whether he was prepared to favourably consider the proposal to fix a light at the top of the Cenotaph to be kept constantly shining; and whether he was aware that the French authorities had put into practice a proposal having a similar object?

Sir John Baird said that the question was considered in June last year. Sir Edwin Lutyens, the designer of the Cenotaph, stated in the Press his objection to the proposal on the ground that the Cenotaph was not designed for the purpose. He shared the views of the distinguished architect in the matter.

CRAFTSMEN COMPETITIONS AT OLYMPIA.

It is intended this year to revive the competitions for craftsmen at the forthcoming Building Exhibition, to be held at Olympia in April, and all the Trades Training Schools are being asked to compete. A committee to arrange the details has been formed consisting of Mr. J. Alfred Gotch, President of the R.I.B.A., Mr. Stanley Hall, F.R.I.B.A., President of the Architectural Association, Mr. E. J. Partridge, F.R.I.B.A., President of the Society of Architects, Mr. Roland Chessum, ex-President of the Institute of Builders, Sir Banister Fletcher, F.R.I.B.A., Director, Trades Training School, Great Titchfield-street, W., and Mr. T. P. Bennett, F.R.I.B.A., of the Northern Polytechnic Institute.

At a recent committee meeting the time for holding the competitions and the conditions to be observed were agreed upon, the subjects to be set being left for further consideration.

It was resolved that the competitions should take place in the following trades:—Carpenters and Joiners, Plumbers, Bricklayers, Smiths, Plasterers, Masons, Painters and Decorators, Glaziers.

The management of the Exhibition offered to give a money prize of £5 to the first prize-winner, £2 10s. to the second, and books to the value of £1 to the third, together with a Diploma of Merit. It was agreed to approach the Companies of the City of London, interested in the Building trades, with a view to their giving special diplomas to the Schools, as apart from prizes to individuals. Particulars may be obtained from Mr. A. Cameron, 43, Essex-street, Strand, W.C.2.

RATES OF WAGES IN THE BUILDING TRADE.

(For rates of wages in the Building Trade in Scotland, see page 165).

CONTRACTS, COMPETITIONS, &c.

For some contracts still open, but not included in this List, see previous issues. Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, &c., may be obtained.

BUILDING AND PAINTING.

JANUARY 26.—**Barnsley.**—HOUSES.—Tenders are invited for the erection of 20 houses, Woodstock-road, Barnsley. Apply Mr. P. A. Hinchliffe, 14, Regent-street, Barnsley.

JANUARY 26.—**Barnstaple.**—HOUSES.—For the erection of 13 houses on the Newport Housing Site, for the T.C. Borough Surveyor, The Strand, Barnstaple. Deposit £3 3s.

JANUARY 26.—**Edinburgh.**—HOUSES.—Erection of 18 two-apartment houses at Sheriff Brae, Leith, for the T.C. Messrs. W. N. Thomson & Co., surveyors, 87, Constitution-street, Leith.

JANUARY 26.—**Exminster.**—OPERATING THEATRE.—Erection of an operating theatre at the Devon Mental Hospital. Messrs. E. H. Harbottle & Sons, architects, County Chambers, Exeter. Deposit £3.

JANUARY 26.—**Ilfracombe.**—ALTERATIONS.—For new cells and alterations and additions to Ilfracombe Police Station, for the Devon C.C. Messrs. E. H. Harbottle & Sons, architects, County Chambers, Exeter. Deposit £3.

JANUARY 26.—**Marylebone, W.1.**—SUNDRY REPAIRS, PAINTING, CLEANSING, &c.—Execution of sundry repairs, painting, cleansing and other work at the St. Marylebone Home, 1, Northumberland-street, W.1, for the Board of Guardians of St. Marylebone. Messrs. Constantine & Vernon, architects, 82, Mortimer-street, W.1.

JANUARY 28.—**Aberdeen.**—HOUSES.—Erection of 33 blocks, each of two cottages; two blocks, each of four flatted houses; two blocks of houses, each for six tenants, for the T.C. Mr. A. H. L. Mackinnon, Architect, 245, Union-street, Aberdeen.

JANUARY 28.—**Barnsley.**—CLUB.—For the erection and completion of an official's club, Little Houghton, near Barnsley. Apply Messrs. Dyson, Cawthorne & Coles, 10, Regent-street, Barnsley.

JANUARY 28.—**Blackpool.**—CONVERSION.—For the conversion of the shop premises in West- and Lytham-streets into municipal offices, for the T.C. Mr. Francis Wood, Borough Engineer, Town Hall-street, Blackpool. Deposit £2.

JANUARY 28.—**Blything.**—ALTERATIONS.—For alterations and additions to the Old Boys' School, Holton-road, Halesworth, and converting the same into a Children's Home, for the Board of Guardians. Mr. A. A. Hipperson, Surveyor's Office, Wangford, Lowestoft.

JANUARY 28.—**Bridgnorth.**—HOUSES.—Erection of 16 non-parlour type houses and six parlour type, for the T.C. Borough Surveyor, Bridgnorth.

JANUARY 28.—**Budock.**—BUNGALOW.—Erection of bungalow at Trescobeas, Budock. Mr. A. J. Cornelius, architect, Truro.

JANUARY 28.—**Carlisle.**—COTTAGES.—Erection of 50 cottages on the Wigton-road Estate, for the T.C. Mr. Henry C. Marks, City Engineer, 18, Fisher-street, Carlisle. Deposit £2 2s.

JANUARY 28.—**Ecuador.**—CUSTOMS HOUSE, &c.—The date for tenders for the construction of the new Custom house and wharf at Guayaquil, Ecuador, has been extended to January 28. Consulate-General, 23, College-hill, E.C.4.

JANUARY 28.—**Glasgow.**—QUAY.—For the construction of about 1,928 lineal yards of concrete quay wall forming Dock No. 1 Shieldhall, Glasgow Harbour, for the Trustees of the Clyde Navigation. Mr. T. R. Mackenzie, General Manager, 16, Robertson-street, Glasgow. Deposit £10.

JANUARY 28.—**Guildford.**—HOUSES.—Erection of alternative types of non-parlour houses as follows:—twelve houses on the West Horsley site, six houses on the Peaslake site, in the parish of Shere, six houses on the Pathfield site, in the parish of Shere, for the Guildford Rural District Council. Mr. John Anstee, Council Offices, Commercial-road, Guildford. Deposit £2 2s.

JANUARY 28.—**Hinckley.**—CONVENIENCE.—Erection of convenience off George-street, for the U.D.C. Mr. J. S. Featherstone, Surveyor, Hinckley. Deposit £1 1s.

JANUARY 28.—**London, S.E.1.**—HOUSES AND ROADS.—Development of a portion of the new Downham housing estate at Grove Park, Lewisham, S.E.: (1) Construction of roads, sewers and other works; (2) the erection of houses and such other buildings as may be determined. Tenders are invited on two alternative bases—(*a*) on the basis of the Council bearing the actual cost of and financing the undertaking and paying a fee or commission to the contractor for his services, the amount of such fee or commission being dependent partly upon a comparison or cost with a predetermined value for the London County Council. Administrator of Housing Development Schemes, Old County Hall, Spring-gardens, S.W.1, upon payment of £10.

JANUARY 28.—**Manchester.**—REPAIRS, &c.—For the execution of general contractor's and plumber's work in connection with the drainage of houses and other premises for 12 months, for the T.C. Mr. J. Irvine, Manager of the Drainage Branch, Public Health Dept., Civic Buildings, 1, Mount-street, Manchester. Deposit £1 1s., for each of three districts.

JANUARY 28.—**Plymouth.**—HOUSES.—The Council are prepared to receive tenders for the erection of 120 houses (the whole or a portion of the number) on four sites at North Prospect (Section No. 2). Form of tender, specification, plans and lay-outs may be obtained, and conditions of contract seen at office of the undersigned, on and after the 17th inst. Tenders, sealed and endorsed "Tenders for houses, North Prospect," together with all documents, &c., must be delivered to the Town Clerk not later than 10 a.m. A deposit of £2 2s. will be required, to be refunded on receipt of *bona fide* tender and return of plans and all documents. The Council do not bind themselves to accept the lowest or any tender. J. Wibberley, Borough Engineer and Surveyor, Municipal Offices, Plymouth.

JANUARY 28.—**Queensferry.**—PAINTING.—For the painter work of 16 houses at Hopetoun-road, for T.C. Mr. W. M. Scott, architect, Linlithgow.

JANUARY 28.—**Tendring.**—COTTAGES.—Erection of 28 cottages in the parishes of Ardleigh, Lawford and Tendring, for the Tendring R.D.C. Mr. F. G. Vincent-Brown, Cliff-road, Dovercourt Bay. Deposit 10s.

JANUARY 28.—**Thurstonland.**—HOUSES.—Erection of eight dwelling-houses at Town Moor Bottom, for the U.D.C. Messrs. J. Berry & Sons, architects, 3, Market-place, Huddersfield.

JANUARY 28.—**Whitfield.**—ALTERATIONS.—For alterations of shop, for the Whitfield Co-operative Society. Mr. Shield, West Side, Whitfield, Northumberland.

JANUARY 28.—**Whittingham.**—COTTAGES, &c.—For erection of 15 pairs of parlour cottages near Mental Hospital, and construction of 450 yds. of roads, &c., for Committee of Visitors for County Mental Hospital. Mr. E. J. Andrew, 33, Winckley-square, Preston. Deposit £1 1s.

JANUARY 29.—**Beddington.**—PAVILION.—Erection of brick and concrete pavilion in Stafford-road recreation ground, for the U.D.C. Mr. S. F. R. Carter, Surveyor, Council Offices, Wallington. Deposit £1.

JANUARY 29.—**Carmarthen.**—PAINTING.—For cleaning and repairing bridges, station buildings, &c., at the following places:—(4) Carmarthen and Carmarthen Junction, (5) Pencader, Newcastle Emlyn, &c., for the G.W.R. Co. Engineer, Neath Station.

JANUARY 29.—**Consett.**—HOUSES.—Erection of cottages houses, to be in blocks of two, four, six and eight. Tenders for 50, 100 and 150 of such, for the U.D.C. Mr. Frank A. Coyle, Architect, 29, Newmarket-street, Consett. Deposit £2 2s.

JANUARY 29.—**Cork.**—VARIOUS WORKS.—(1) Reconstruction of soldiers' quarters, and (2) cookhouse and dining huts at Michael Barracks, for the Commissioners of Public Works. District Office of Public Works, Cork. Deposit £1.

JANUARY 29.—**Dover.**—WALL, &c.—Taking down and rebuilding wall, &c., at Crabble-hill, for the T.C. Borough Engineer, Dover.

JANUARY 29.—**Ebbw Vale (Mon).**—NEW STATION BUILDINGS.—For erecting, for the G.W.R. Co. at Ebbw Vale (Mon), of new station buildings. Office of the Engineer, Newport (Mon), G.W.R. Station.

Forces during the War, be fully capable of preparing working drawings and specifications for general civil engineering or architectural work. Employment will be for varying periods, and must not be regarded as permanent. Joint Substitution Board (Treasury and Ministry of Labour), Montagu House, Whitehall, S.W.1

PROPOSED NEW BUILDINGS & OTHER WORKS.*

IN these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works at the time of publication have been actually commenced. Abbreviations:—T.C. for Town Council; U.D.C. for Urban District Council; R.D.C for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; L.C.C. for London County Council; B.C for Borough Council; and P.C. for Parish Council.

ADWICK (YORKS).—At the last meeting of the U.D.C. it was stated that an agreement had been reached for the erection of about 1,000 houses by the Industrial Housing Association. The work is to be commenced at once, and the houses are to be divided between the districts of Adwick, Woodlands and Highfields.

ANNFIELD PLAIN.—The U.D.C. have received intimation that the M.H. approve the Council's proposal to afford financial assistance to private enterprise in the erection of 50 houses to the extent of £75 per house likely to be commenced before March 31, and have also sanctioned the borrowing of £3,800 for these grants.

BINGLEY.—The Committee of the Bingley Cottage Hospital have under consideration a scheme for extensions to the present premises, which are inadequate for present-day requirements. Plans are being prepared, and it is hoped to make an early start. Sir James Roberts has made a grant of £3,000 conditionally upon the work being commenced before the end of 1924.

BRADFORD.—The City Architect has been instructed to inspect the Low Moor district with a view to a suitable site being acquired upon which to erect a new elementary school for the district.——Plans have been prepared and tenders are to be invited for the erection of a new spinning shed for Messrs. E. Sykes & Co., Ltd., of Willowfield-street. Mr. W. E. Bickers, of Bradford, is the architect.

BRANCEPETH.—At a special meeting of Brancepeth and Oakenshaw Aged Miners' Homes Association, plans were approved for the building of nine cottages and a reading room for aged single miners, as a war memorial. Messrs. John Plummer and W. Cummings offered their services (which were accepted) as honorary architects for the new cottages.

BRECONSHIRE.—A joint meeting of the Radnorshire and Brecon County Main Roads Committee has agreed that the widening of Builth bridge and improvement of approach roads be proceeded with at an estimated cost of £7,000; the counties to share cost remaining above M.T. grant. The Breconshire Main Roads Committee has resolved upon road resurfacing and improvement works at an estimated cost of £20,000, and, subject to grant being made, will proceed at once with outstanding works, estimated to cost £3,000.

BRIDLINGTON.—Mr. A. E. Goddard, an inspector of the M.H., has held an inquiry into the application of the Corporation to borrow £50,000 for defraying the cost of the acquisition of premises for the extension of the Royal Prince's parade and other improvements. The specific purposes of the application included the construction of suitable means of communication, underground or otherwise, between the Royal Prince's parade and the proposed extension of the parade, and the erection of buildings, shops, and places of entertainment and recreation, refreshment rooms, and places for games, &c.

BRIGHTON.—If the T.C. approves the decision arrived at by the General Purposes Committee, Brighton Aquarium will soon be a thing of the past. The report which the committee has approved proposes the clearance of the site and its conversion into public gardens with a restaurant, café, public hall, and other features. Expert advice is to be obtained to enable the scheme to be carried out.

BRIGHTON.—Plans passed by T.C.: Out-patients' Department, Sussex Throat and Ear Hospital, Church-street, T. Garrett & Son, for the Committee of Management; alterations, 101 and 102, Trafalgar-street, W. H. Overton, for Freeman, Hardy & Willis; stage platform, King's Cliff Cinema, Sudeley-place, W. H. Overton, for W. Easter; two houses, Hollingdean-terrace, W. J. Burstow, for J. Morley; conversion into two maisonnettes, 3, Buckingham-road, W. H. Overton, for Miss Lynn.

CARMARTHENSHIRE.—The County E.C. has moved to compulsorily acquire land on which to erect a new central school at Berry Port. The surveyor to the Llanelly B.C. is to report on possibilities of proceeding with Gwendraeth water scheme and to submit estimates of cost of constructing a third reservoir at Cwm Lliedi. The house of the Deputy Chief Constable of Cardiganshire at Lampeter is to be repaired and altered by the Cardiganshire Standing Joint Committee.

CHARLESWORTH.—The Charlesworth parish, situate in the Glossop-dale R.D.C.'s area, is showing signs of great activity in the building trade. A lay-out plan for 400 houses has been approved, and an immediate start is to be made with 100 of these. When the scheme is further developed the L.N.E.R. propose to erect a new railway station.

CHEADLE.—Plans passed by R.D.C.: House, Cheddleton, for Mr. A. Gilbert; house and shop, Weston Coyney, for Mr. A. Williams; two pairs of houses, Cheddleton, for Messrs. Lawton, Leese, Ward & Evans; addition to bungalow, Wetley Moor, for Mr. Mellor; addition to house, Threpwood, for Mr. J. Cornes; two hutment bungalows, Caverswall, for Mr. Lovatt; hutment bungalow, Cheddleton, for Mr. Goldstraw.

CHESTER.—Plans passed by T.C.: Conversion of 11, Stanley-place into flats, for Brown & Co. (Chester), Ltd.

DURHAM.—The Durham County E.C. propose to erect a number of new secondary schools in the county, and the Teesdale District Education Authority is strongly pressing the need for one of the new schools for the Teesdale neighbourhood.

CORNWALL.—The Highways Committee has adopted a roads and bridges improvement scheme which involves an expenditure of over £150,000. The largest items on the schedule are the construction of a new by-pass road at St. Austell, at a cost of £30,000, which it is stated will entirely alter the character of the town and add greatly to the rateable value, and the building of a new bridge and approach works at Trevemper, at a cost of £9,000.

DARLINGTON.—The T.C. have approved the following plans: Mr. A. Chilton, bungalow and shop, Coniscliffe-road; Mr. F. Jackson, house, Linden-avenue; Messrs. Bussey & Armstrong, eight houses, Haughton-road.

DENBY AND CUMBERWORTH.—Plans passed by U.D.C.: Houses for Messrs. John Dransfield (Denby Dale); Charles E. Firth, Denby Dale; Arthur Turton, Upper Denby; and William A. Heap, Denby Dale.

DERBY.—The Housing Committee of the T.C. has decided to invite tenders for a further 128 houses—46 parlour type and 82 non-parlour type.

DROITWICH.—House in Lyttleton-road, for Mr. Everton; 12 houses on the Woodfields site, for the Council; and new chapel and Sunday schools in Tagwell-road.

DRONFIELD.—Plans have been approved by the U.D.C. for a pair of semi-detached villas in Green-lane, for Mr. C. I. Margerison, and a house for Mr. J. H. Platts, in Princess-street.

EAST HAM.—Plans passed by B.C.: Alterations, United Methodist Church, Manor Park, for J. Slater & Keith; extension, rear of Latimer Hall, Boleyn-road, for G. W. Goodall.——The engineering inspector of the M.H. has advised the Council to accept the report of Mr. Kiermen, consulting engineer, on the heating and hot water supply, &c., at the Isolation Hospital.

EDINBURGH.—Plans are being prepared for the erection on a site west of the village of Dean of a large garage and workshop by the Wolseley Motors, Ltd., the proprietors, for Messrs. Vickers. Mr. John Jerdan, F.R.I.B.A., Edinburgh, is the architect. The building will be one of the largest and most up-to-date of its kind in Scotland, the estimated cost being between £60,000 and £70,000.——Warrants granted by Dean of Guild Court: J. Easton, convert self-contained house, 8, Bellevue-crescent, into three separate houses; Thomas Ferguson, seven villas, Colinton-road; London & North Eastern Railway Co., smithy and machine shop, Baileyfield-road, Portobello, and new roof, North Leith passenger station; A. A. Morris & W. B. Wyllie, double villa, Jeffrey-avenue, Blackhall; J. W. Wallace, villa and two cottages, Meadowplace-road, Corstorphine; Office of Works, telephone exchange, Russell-road.

EPSOM.—Plans passed by R.D.C.: Three houses, Ashtead, one in Links-road, for Mr. E. B. Ecaile, one in Harriott's-lane, for Mr. C. J. Barlow; and one in Harriott's-lane, for Mr. R. A. Tait; bungalow, The Park, Great Bookham, for Mr. Meaburn; house, Guildford-road, for Mr. T. M. Proctor; house, The Park, for Mr. H. W. Gardener; bungalow, Fetcham, for Miss C. Finch.

ERPINGHAM.—The R.D.C. has decided to erect six houses at Knapton, six at Northrapps, four at Gimingham, and two each at Trimingham and Runton.

EXMOUTH.—The Southern Railway has decided to put in hand at once the construction of extensive new engine and repair sheds at Exmouth Junction, and has accepted the tender of A. Jackaman & Sons, Ltd., of Slough, for the first section of the work.

FALKIRK.—Plans were passed at the Dean of Guild Court, on the application of Falkirk Iron Co., Ltd., for the erection of a block of four flatted houses, at Bankside, at an estimated cost of £1,800; and warrant was also granted to Stirlingshire and Falkirk Water Board to make alterations on Belmont House, and reconstruct outhouses, estimated to cost £1,800.

FELSTED.—A M.H. inquiry has been held by Mr. T. R. Grigson in regard to an application by the Dunmow R.D.C. for permission to borrow £1,200 for a sewerage scheme and sewage disposal works for the parish of Felsted.

FOLESHILL.—Plans passed by R.D.C.: Three houses, Lythall's-lane, Foleshill, for Mr. A. Day.

GLAMORGAN.—The Mid-Glamorgan Water Board, Bridgend, has notified Maesteg U.D.C. that as soon as plans have been completed a new high level reservoir for supply to Maesteg district will be constructed by the Board. The Maesteg U.D.C. has passed plans for buildings to be erected by Mr. W. T. Lewis on site between the "King Alfred" and "Sawyers Arms." The Council has approved the plans of surveyor for an approach road and entrance to the park, and has sanctioned the demolition of certain unsightly buildings in the vicinity. Plans have been prepared by Mr. J. Simon Davies, the architect to the Penybont R.D.C., on behalf of 40 applicants for grants, under Small Dwellings Acquisition Act, from Council. The applicants intend to build at Heolycyw site. The Pontardawe U.D.C. has decided to carry out Garnsyllt water supply scheme at an estimated cost of £2,325. Details of the projected construction of a main road to connect the heads of all the mining valleys of North and Mid-Glamorgan have now been submitted to the U.D.C.s concerned. The scheme is estimated, tentatively, to cost £366,411, of which one-half has been provisionally promised by M.T. The main connecting road, as planned, will be 17 miles long with six spur roads from main artery into the several valleys of lengths varying from one to four miles. The allocation of costs between the various councils is now being proceeded with. It is hoped that the work will be well advanced by the summer. The approximate costs are as follows:—Main route and three spur roads, £225,000; Blaen Rhondda-Rhigos spur, £51,880; Pont-Neath-Fechan, Banwen, Seven Sisters and Rhos Common spurs, £89,561; total £366,411. The Barry U.D.C. has approached G.W.R. directorate with request that proposed work of constructing new dock be put in hand at once to give partial relief to local unemployment situation. The Penarth U.D.C. has decided to put in hand work of constructing war memorial obelisk, of design by Sir John Goscombe John, and to become responsible for cost, estimated to amount to £2,000.

HALSTEAD.—Plans passed: Eight houses, Factory-lane, for Messrs. Courtaulds, Ltd.

HARTLEPOOL.—The War Memorial Homes and Crosby Homes Committee have decided to erect eight more houses, at an estimated cost of £3,936.

HAZEL GROVE.—Plans passed by U.D.C.: Bungalow, Mill-lane, for Mr. J. Allen; four houses, Tenement-lane, for Mr. W. Stainsby; four houses, Victoria-avenue, for Mr. W. Turner; four houses, Chester-road, for Messrs. C. F. Lloyd, J. Royds, and Messrs. Bancroft & Pixton; four houses, Commercial-road, for Messrs. Bancroft & Pixton; house, Douglas-road, for Mr. H. G. Hall; two houses, Dean-lane, for Mr. G. Griffin; 12 houses, Bramhall Moor-lane, for Messrs. Unsworth & Wilson; two houses, Bean Leach-road, for Messrs. Bowden & Fidler; two houses, Offerton-lane, for Mr. W. Bramwell; new road, Grassmere-crescent, Bramhall, for Sir Thomas Rowbotham and others; new road, St. Michael's-avenue, Bramhall, for Sir Thomas Rowbotham and others; new road, Pownall-avenue, and part of Ladythorn-grove, for Messrs. Brocklehurst.

HESTON AND ISLEWORTH.—Plans passed by U.D.C.: Messrs. Cory Bros. & Co., Ltd. cottage and petrol filling station Bath-road; Mr. J. W. Westlake, for two houses Bristow-road; Messrs. Roper, Son & Chapman, for seven bungalows, Sutton-lane; and five bungalows, St. Mary's-crescent; Mr. T. A. Chapman, bungalow, Harte-road; Mr. J. Chandler, bungalow, New Heston-road; Hounslow Sand and Gravel Co., bungalow, Sutton-lane; Mr. W. J. Harris, bungalow, Station-road; Building Enterprises, Ltd., two houses, New Heston-road; Mr. A. W. Gibson, two cottages, Wellington-road North; Mr. H. Langford Moyle, house, Grove-road; Messrs. P. Chase Gardener & Co., two houses, Staines-road; house, Loring-road; house, Hounslow-gardens; four houses, Spring Grove-road; and house, Thornbury-avenue; Mr. H. B. Phillips, two houses, Hounslow-avenue.

HOLLINGBOURNE.—Plans passed by R.D.C.: Three cottages, Sutton Valence, for Mr. A. J. Ellis; two cottages, Lidsing, for Mr. Pye; bungalow, Broomfield, for Mr. M. E. Read; bungalow, Broomfield, for Mr. P. Collison.

HORBURY.—Plans passed: House off Regent-street, for Mr. T. H. Holland, and an electricity sub-station at Horbury Bridge, for Clement Smith.

HUNSWORTH.—Plans passed by U.D.C.: Bungalow, top of Hunsworth-lane, for Mr. Albert Ingham.

ISLE OF MAN.—In the Tynwald Court £7,000 was voted for the erection of a shelter on the Victoria Pier at the south side.

JARROW.—It is proposed to erect a new R.C. church, the T.C. having decided to sell a portion of their housing land for £2,000.

KEIGHLEY.—Private builders are erecting about 60 houses. Sixteen houses are to be erected in eight pairs in Fell-lane, a new road being constructed in connection with the latter scheme. Plans passed by R.D.C.: Two houses, for Mrs. Harrison, at Barney Castle.

KENILWORTH.—Plans passed by U.D.C.: House, Clinton-lane, for Mr. S. T. Thornett; house, Whitemoor, for Mr. J. W. Golby.

KIRKCUDBRIGHT.—Mr. Hall Blyth, of Edinburgh, has designed a ferro-concrete bridge for the T.C.'s new bridge scheme. The estimated cost is approximately £20,000, of which the M.T. will grant 63 per cent. The bridge will consist of five spans, with a roadway 24 ft. wide from kerb to kerb.

LLANDILO.—The R.D.C. has passed plan for a new memorial, public hall and library. The estimated cost is £10,000, and the architect is Sir Charles Ruthen, Swansea. The work of erecting hall is to be put in hand in February.

LARGS.—It has been remitted to a Committee of the T.C. to consider the question of a town hall.

LETCHWORTH.—The U.D.C. has been informed that the M.H. are prepared to approve a new sewerage scheme for the town, subject to modifications which will increase the cost of the works by £2,445.

LONDON.—The L.C.C. Asylums Committee is recommending that a capital expenditure of £33,000 for the completion of West Park Mental Hospital be approved.

LONDON.—The Mental Hospitals Committee of the Metropolitan Asylums Board proposes the installation of a central forced circulation hot-water supply system in the schools section at Darenth Training Colony, at an estimated cost of £1,950.

LONDON (BERMONDSEY).—The L.C.C. has sanctioned the B.C. borrowing £10,883 for paving works.

LONDON (HACKNEY).—Plans passed by B.C.: Shops and dwellings, High-street, Homerton, for H. J. Ramus; extension of Willey & Co.'s premises, Hertford-road, for J. Jarvis & Sons; two houses, Grove-lane, for J. Garey & Son.

LONDON (PADDINGTON).—Sanction has been given by the L.C.C. to the B.C. borrowing £23,722 for paving works.

LONDON (STOKE NEWINGTON).—The Minister of Health has decided to hold an inquiry into the proposal of the Stoke Newington Council to build new public baths.——Factory, Eade-road, for Stone & Drew.

LONDON (ST. MARYLEBONE).—The Works Committee of the B.C. recommends that for the next financial year tenders be invited from contractors for all new carriage-way reconstruction works on Class 1 and 2 roads.——It is proposed to construct an underground lavatory in Salisbury-street, at a cost of £2,350.

* See also our List of Contracts, Competitions, etc.

LOOE (CORNWALL).—The U.C. authorised the quisition of the properties in Fore-street necessary order to carry out a proposed street improvement, ans of which are to be submitted to the M.H. for pproval. The offer of Colonel Tremayne to sell the eehold of certain land required for the proposed water xtension scheme for £835 was accepted, and the rveyor was instructed to prepare a plan showing the roposed works.

MANSFIELD.—Plans passed by T.C.: A. J. Copeake, conversion of house into business premises, eeming-street; F. Johnson, extensions to factory, eed Mill, Bleakhills-lane; Intake Freehold Land ociety, three new streets; H. Baggaley, four houses, ottle-lane; —. Griffiths, house, Nottingham-road; . Booker, two houses, Southwell-road; E. M. Webster, ur houses, Sandy-lane and Gladstone-street; H. ames, house, Atkin-lane; H. James, house, Bottleane.

MERTHYR TYDFIL.—The T.C. is shortly to call for nders for erection of 100 concrete houses at Treharris nd 50 concrete houses at Gellifaelog. The houses will e erected on one of the following systems, "Duoslab," Hollocrete," or "Tidler." The Council will later ecide upon a Housing Committee recommendation hat 80 houses be erected in brickwork, 30 at Aberfan nd 50 at Pant, in addition to concrete houses deinitely decided upon.

MIDDLESBROUGH.—At a meeting of the Public ibrary and Museum Committee it was stated that in he near future three branch libraries would be necesary, and a sub-committee was instructed to consider scheme for the provision of a branch library at North Ormsby. It is proposed to carry out extensions o the West-lane Hospital.

MIRFIELD.—Plans passed: Electricity sub-station t Newgate, for the Yorkshire Electric Power Co., td., and dwelling house and shop at Nettleton-road, or Mr. Schofield.

MONMOUTHSHIRE.—The Mynyddislwyn U.D.C. has assed plans submitted by the Tredegar Iron & Coal Co., td., for an accommodation road to be constructed by he company near its new Wylie Colliery. The County Main Roads Committee has decided to widen the main oad between Factory Trip and "Swan Inn," Abercarn, t an estimated cost of £10,000, subject to fifty per cent. rant being received from Ministry of Transport. The committee has also resolved on widening the Usk-Pontypool-Crumlin road, at an estimated cost of £5,100. The County Surveyor has received instruction to plan new road commencing in line with River bridge, Caerleon, and ending near the Drill Hall, on the Common. The C.C. has decided to spend £250 on provision of better laboratory accommodation at County Hall. The Abercarn U.D.C. having received £850 grant from the Newport-Abercarn Coal Co., toward cost of repair of Alcenyn-road, will now put work in hand. It is estimated to cost £1,750. The Usk U.D.C. has passed plans for houses which Messrs. Sweet & Sons propose to erect in Abergavenny-road.

NEWCASTLE.—A strong effort is to be made by the Corporation Housing Committee to complete the Walker Estate, and in furtherance of this project the housing architect has been instructed to prepare plans for the two remaining sections, with provision for about 150 houses.——An immediate commencement is to be made upon a scheme for the development of the Woodlands Park Estate, near Gosforth Park, Newcastle, for building purposes, where it is proposed to lay out 30 acres of land, and to erect bungalows of the semi-detached type, 12 to the acre. Plots of land will adjoin each house, and purchasers will be asked to incorporate their own ideas in the construction of the houses, which will be of six and seven rooms each. The architects for the scheme are Messrs. Marshall & Tweedy, of 54, Grey-street, Newcastle, who are at present laying out a site on the opposite side of the main road, at the same spot, several houses having already been completed.

NEWPORT (MON.).—The Poldi Steel Co. (England), Ltd., is in communication with the Newport Development Association for the acquisition of site near River Usk, on which the company proposes, tentatively, to erect new works. The site has been inspected and reported on by the company's representatives. A permanent stone church is to be erected to replace the old iron structure at St. Julian's, Newport. The "King's Head Hotel" has been purchased by Messrs. Griffiths & Sons, clothiers, for the purpose, it is reported, of conversion to shop premises. The B.C. has approved design of architect, Mr. Basil Mott, London, for new Usk bridge to be erected at an estimated cost of £165,000, of which 65 per cent. is promised by M.T. It was stated at a meeting of the Council that preliminaries to putting work in hand are well advanced. The Council now contemplate construction of an additional 40 ft. wide approach road at western end of bridge.

PEMBROKESHIRE.—The Goodwick U.D.C. has been informed that scheme for erection of houses by G.W.R. workmen has advanced to extent of purchase of site. The Pembrokeshire Territorial Association is to invite tenders for alterations necessary at Bush Camp, Pembroke Dock. The Standing Joint Committee will alter and repair police buildings at Milford Haven at an estimated cost of £300. The C.C. is negotiating with view to adaptation of one of the disused forts as a smallpox and isolation hospital. The Main Roads Committee will shortly invite tenders for considerable tar surfacing of main roads. The repair and widening of St. Clears-Narberth and Narberth-Cardigan roads is to be undertaken at an estimated cost of £20,470 in so far as they lie in the Whitland and Norbeth Councils' areas, the estimated cost of the Cardigan road improvement in the area of the St. Dogmael's Council is £30,000. When work has been completed the C.C. is to take the road over. The Whitland U.D.C. is advised by its surveyor to ask for tenders for supply of road materials sufficient for the year.

PLYMOUTH.—An important improvement scheme which embraces the widening of Coburg-street, an important thoroughfare, the re-erection of the education offices and the building of a clinic, costing in all over £60,000, has been decided upon by the Corporation.

POULTON.—Plans passed by U.D.C.: Mr. R. E. Porter, Four Lane-ends, Carleton, detached houses, Blackpool-Garstang-road; Mr. Gerland Emery, Chapel-street, detached houses, Lower Green; Mr. E. Armitage, Sheaf-street; Mr. H. B. Bryan, Hardhorn-road, four semi-detached houses, Blackpool-Garstang-road.

RICHMOND (SURREY).—Plans passed by T.C.: Mr. B. J. Mitchell, six houses, 2–12, Defoe-avenue; Mr. E. J. Partridge, alterations and additions, 45–49, The Quadrant.

RICHMOND.—A proposal is on foot to erect a new cinema, skating rink, and "palais de danse" at Richmond (Yorks), at a total cost of about £10,000. The venture has been initiated by Mr. T. Pinder, and plans have already been prepared by Messrs. Wetherell & Son, architects. The building will be 110 ft. by 50 ft., and will provide seating capacity for 800 people, and it will be situated in Station-road. It is hoped that the building will be completed by September.

SEDGEFIELD.—The R.D.C. have approved of the following plans: Four houses in Church-lane, Ferryhill, for Mr. W. Dunn; 24 houses at Chilton, for the Chilton Building Estate; and the conversion of the old schools at Sedgefield into cottages, for the Sedgefield Education Foundation.

SOUTH CROSLAND.—Plans passed by U.D.C.: Eight cottages, Banksfoot-lane, for Mr. T. Brooke.

STAFFORD.—Plans passed by R.D.C.: House, Billington House Farm, Bradley, for T. Williams; two bungalows, White Cross, Haughton, for Mr. R. Fowell.

STANSTEAD.—Plans passed by R.D.C.: Cottage, for Mr. A. E. Watson, Stansted; bungalow, Henham, for Mr. Collett; pair of cottages, Stansted, for Mr. W. R. Brown.

STOCKTON-ON-TEES.—Plans passed by T.C.: Bungalows, Darlington-lane, for A. E. Snowdon and C. Bradley.

SWANAGE.—Plans passed by U.D.C.: Flat, &c., Station-road, for G. Edgar; shop and stores, Station-road, for H. & F. Smith.

TAMWORTH.—Mr. R. C. Cox, an inspector of the M.H., has held an inquiry in relation to the application of the T.C. and R.D.C. to borrow £4,200 and £8,800 respectively, for works of water supply.

THAXTED.—A M.H. inquiry has been held by Mr. T. R. Grigson in regard to an application from the Dunmow R.D.C. for sanction to a loan of £6,800 for a sewage scheme and disposal works for Thaxted and of £4,400 for a new water supply.

THORNABY.—The Corporation have decided to proceed with a scheme for the erection of 100 houses, 50 of which will be built by the authority, and 50 by private enterprise.

THURNSCOE.—The U.D.C. are having 600 houses erected, and are also considering the question of enlarging their sewerage and sewage disposal works. W. H. Radford & Son, Nottingham, have been asked to report on the matter.

WALLSEND.—The T.C. have resolved to erect an additional 36 houses by direct labour.

WILLESDEN.—Plans passed by U.D.C.: Five houses, 38, 40, 42, 44, 46, Holland-road, Harlesden, and two garages, by Messrs. Done, Hunter & Co., for Mr. R. Curner; four houses with garages, 96, 98, 100, 102, Chatsworth-road, Cricklewood, for Mr. C. W. B. Simmonds; 11 houses and six garages on the west side of Heber-road, Cricklewood, by Mr. George Coles, for Mr. M. Cohen.

WINLATON.—Terms have been arranged for the purchase, by the Blaydon U.D.C., of the Bleach Green Estate, Winlaton. Within the next twelve months it is hoped that the authority will be able to erect at least 600 houses in all, 400 being in the Blaydon and Winlaton district, 100 at Chopwell, and the remainder being spread over the rest of the district. Sanction was given at the meeting for the carrying out of a sewage scheme at Park Head.

FIRES.

FALKIRK.—Much damage has been done by a fire which occurred in the administrative block of the Stirling Eastern District Committee's infectious diseases hospital at Camelon.

TRADE NEWS.

We have received from Messrs. Wm. T. Nicholls a small booklet illustrating a number of their artistic wood mantels.

Messrs. J. Starkie Gardner, Ltd., metal workers, has been registered as a private company. Premises have been secured at Merivale-road, Putney.

We are informed by Vigilant Sprinklers, Ltd., of Stuart House, 1, Tudor-street, E.C.4, that their automatic sprinkler system has been installed at the new preimses, 45–47, Gresham-street, and 22, Wood-street, E.C., illustrated in our last week's issue. Vigilant automatic sprinklers have also been installed at the new "Fortune" Theatre, Russell-street, W.C. The firm have also supplied the sprinkler protection for the stage, dressing-rooms, &c., as also the system of drenchers for the fireproof curtain, as well as the complete system of fire hydrants for the protection of the front of the house.

JANUARY 18.—**Burntisland.**—HOUSES.—Plumber and gasfitter works of five blocks of houses (10 houses in all) to be erected on Haugh site. Mr. J. A. Waddell, Burgh Surveyor, Burntisland. Mr, G. C. Campbell, architect, Methil. Messrs. Peter Lawrence & Co., surveyors, 50A, Frederick-street. Edinburgh.

THE SCOTTISH BUILDER

Highland Road Reconstruction.

A reconstruction scheme was recently brought forward by the Upper Banffshire District Committee of Banff County Council for opening up communication in the upper part of Aberdeen, Banff and Moray.

If the proposal is given effect one of the most famous roads in the Highlands, known as "The Lecht"—driven through the mountain by General Wade in 1754—will cease to be the trouble it now is to motorists. "The Lecht," which stretches between Tomintoul in Banffshire and Cockbridge in Aberdeenshire, connects the valleys of the Spey, the Don, and the Dee. It is dangerously narrow, and contains gradients of 1 in 5. The Board approved of the proposals, and decided to apply for a Government grant.

Tidying-Up Scotland.

The directors of the Edinburgh Chamber of Commerce recently held their usual monthly meeting. Sir James H. Warrack, K.B.E., presided.

The President said that the Smoke Abatement (Scotland) Bill, introduced by Viscount Novar on behalf of the Scottish Board of Health, amended several existing Acts and extended their powers. It proposed substantially to increase the penalties which might be imposed on manufacturers responsible for the emission of black smoke. Section (1) rendered any person who allowed smoke to issue from any furnace or fire (except a household fire) liable to a penalty of from £5 to £50 unless he could prove that he had adopted the best practicable means for preventing smoke, having regard to the cost. Section (3) gave the Scottish Board of Health power to make orders extending the provisions of the Alkali, &c., Works Regulation Act, 1906, to any noxious or offensive gas, and extending the list of works mentioned in that Act. Section (4) gave powers to town councils and local authorities to make by-laws requiring new buildings, other than private houses, to make arrangements for heating calculated to prevent or reduce the emission of smoke. The Bill also extended the penalties for smoke emission to steamships, although it was exceedingly difficult for steamships entering or leaving harbour to avoid the emission of black smoke.

On December 27 a deputation representative of the coal-mining, shale, steel, and iron industries, including representatives from the Glasgow and Edinburgh Chambers of Commerce, met the Scottish Board of Health, and discussed the clauses of the Bill. The deputation asked for certain amendments, which the Board promised to consider. The future would show, therefore, whether the Bill would be so amended as to remove the anxieties of manufacturers.

It was agreed to remit the subject to the Parliamentary Bills Committee, with powers to take such steps as might be necessary in the interests of industries in Edinburgh which might be unduly hampered by the extended proposals of the new Bill.

NEW BUILDINGS IN SCOTLAND.

Kilsyth.—HALL.—Efforts are being made in order to provide a new recreation hall for the congregation of St. Patrick's Roman Catholic Church.

Johnstone.—CLUB HOUSE.—The Dean of Guild Court have passed plans for a bowling club house in Brewery-street, for Finlayson, Bousfield & Co.; a house in Quarrelton-road, for Mr. P. Jaffrey; and a house in Thomson-street, for Mr. J. Jack.—The T.C. has decided to purchase vacant land in MacDowall-street and a portion of land between Cartside Cottage, in Laighcartside-street and Fyfe-place, in Rassell-street, for a new housing scheme.

Ayr.—VARIOUS.—The following plans have been passed:—W. C. Gray & Sons, Newton Carpet Works, buildings in McCall's-avenue; W. G. Walker & Sons, Hawkhill Chemical Works, workshops in Somerset-road; Mr. F. H. McPherson, a double cottage in St. Leonard's-road; and Mr. H. Findlay, New-road, Ayr, house in Craigie-road.

Aberdeen.—VILLAS.—The Aberdeen District Board of Control has agreed to the erection of additional villas at the Kingseat Asylum, and the extension of the nurses' home, at an estimated cost of £43,000.

Hawick.—POST OFFICE.—The T.C. has decided to petition the Postmaster-General to establish a fully equipped branch post office for the west end of the town.

Campbeltown.—CHURCH.—The sum of £1,010 has been raised for renovating the interior of Highland Parish Church.

Helensburgh.—SITE.—A site at the corner of West Clyde-street and the east side of Colquhoun-street has been purchased by the National Bank of Scotland.

Glasgow.—PAVILION.—The T.C. has decided to erect two small pavilions at the tramway employees' recreation ground at Parkhead, at a cost of £3,500.

Callander.—ALTERATIONS.—The West Perthshire Licensing Court has passed plans for alterations to the Dreadnought Hotel, Callander.

Portree.—HOUSES.—The Skye District Committee of the Invernesshire C.C. has issued instructions to the architect to prepare plans for building two houses at Portree and two at Kylcakin.

Bridge Contracts.

Messrs. John Butler & Co., Ltd., of the Stanningley Ironworks, Leeds, have been awarded bridge contracts for the Manchester, Salford and Preston Corporations, and for fourteen 60 ft. spans to form three new bridges required by the Indian State Railways.

BUILDING TRADE WAGES IN SCOTLAND.*

THE following are the present rates of wages in the building trade in the principal towns of Scotland. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

	Masons.	Brick layers.	Carpenters, Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Brick- layers' Labourers.	Masons' Plasterers' Labourers.

THE BUILDER

JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

OL. CXXVI.—No. 4226. FEBRUARY 1, 1924.

LONDON AND CHANCE.

WHEN will London seriously take in hand the transport question? We do not mean the piecemeal consideration of it, but the whole broad aspect of it. It is utterly wrong to consider Lambeth dge, Charing Cross Bridge, Waterloo Bridge, or the jected St. Paul's Bridge without a wide and extended w of the traffic with which they are concerned. As a tter of fact, no great scheme of bridge-building, or embankıt improvement, or better town-planning, along the north l south banks of the Thames, ought to be taken in hand il the railway problem is solved. If we go on as we are ng now the time will come when the railway problem will peratively demand a solution, when we may have been mmitted to schemes which make it ten times more difficult. The fact is that, notwithstanding our wonderful progress many things, and our splendid service in the government of ndon, both official and voluntary, we are only muddling ng in what seems to be our inevitable British fashion. When ll we realise the vast importance of carefully-studied foreht as to city development? The right development of ndon is doubtless no easy matter to achieve, but we venture think it would be infinitely less arduous if we would take study of it in proper sequence and in the order of importance. The decision to proceed with St. Paul's Bridge appears to us be a tragic mistake, at all events until its bearing on the ffic problem and future possibilities is far more carefully nsidered. Is there no power which can evoke some commonse method of procedure in handling this great problem of ndon's growth? We have counsellors enough, and brains ough, and yet we are trying to do the right thing in the ong way.

The other day the President of the Royal Academy aroused ne real interest at the Royal Institution when he pointed t the present disgraces and the future possibilities of London. ıt our complicated system of government, and our lack of high controlling authority, with power to insist on the wider sion and to dictate the direction that improvements should ke, bar the way to right and efficient action. It is surely a atter for wonder that, amongst the numerous able Chairmen the London County Council, which have included statesmen the first rank, this initial lack of London has apparently not en realised. Why should this vast congregation of millions the victims of such mischance and haphazard? We have a ght to ask this, and it is the duty of those who wish to work r the public good and are able to do it to help us to reach me order out of the present chaos. The London Society was unded in order that those who have the welfare of London heart might bind themselves together to promote a sounder d wider vision, not as to mere abstract beauty, but as to the neral amenity of London and the well-being of its citizens. o subject which affects such matters is beyond its aims, and it includes a large number of its ablest citizens and has no rty aims, no troublesome politics, no awkward shibboleth; there is no reason why it could not produce and offer the best counsel and the most unbiassed judgment. The time has surely come when this influential body should bestir itself and make the citizens of London realise where they stand in regard to the future of their city. The Society does not exist to pick quarrels with any other body, or to find fault with the many able officials to whom London owes so much. But in this great wide city of London, which contains so much of the finest brain power in the world, we are lacking a right hand to put to profitable use our wonderful powers and opportunities. There is no need to squander millions on doubtful projects, but we can safely affirm that no intelligent man of business is so seriously wanting in forethought of his future and its chances as is the collective body of the citizens of London. We do not permit anyone to run a fried-fish shop in Regent-street, and we have at last given up making pickles and beer in Holborn. Let us, then, avoid pouring a fresh heavy traffic from north to south over such congested areas as the east end of St. Paul's Cathedral.

A correspondent writes:—"Why are the public kept in the dark with regard to matters like the St. Paul's Bridge? We have long been told that this bridge has been proposed, and now we learn that no approach roads have been decided upon. Without approach roads it would be just as useless as Southwark Bridge. Probably when too late the London Society, or some other body, will find that the proposal is one which should be opposed, but with which we are helpless in view of the difficulties thus imposed by officials. If the bridge is to be a success, millions of people will pour across it from north and south. What, then, will happen to the traffic from east and west at the crossings of Cannon-street and Cheapside? It would appear that such a bridge, if successful, would make confusion worse confounded. The whole thing is typical of British officialism—we are kept in the dark until too late for effective opposition. It must now be realised that there is an intelligent public, who are interested in, and capable of understanding, such things, and that they should be taken into confidence in the early stages of the proceedings in view of the growing interest in citizenship."

There is a practical possibility in front of all this. We want, at once, a general controlling body for the whole of London which shall be able to unify all our disjointed and piecemeal effort into one carefully considered. We want all the good counsel we can get, but lectures and exhortations, articles and letters go but a little way. Is it possible that the London Society can be a sort of Baron Haussman, not only to direct a few fine thoroughfares, but to start us off in the right way to have a plan for London which shall forecast something like a right future for our railways, our roads, our bridges, and the thousand other things that make a city both convenient and beautiful?

We cannot believe that the vision of a noble and beautiful city is really a matter of indifference, but every one of us is guilty of some measure of apathy and ignorance.

NOTES.

Fine Arts Commission. The appointment of a Fine Arts Commission might be a very good thing, but on the other hand it may not be an unmitigated blessing. There are evils in all control, and we cannot forget the possibility of having to cry to be saved from our saviours. One of the first things the Fine Arts Commission might usefully do is to clear away some of our statues, says Mr. Ralph Knott, who objects, amongst other things, to the Lincoln memorial with its "stupid, ugly chair." The general public who pays any regard to the discussion by artists on such matters must be a little mystified as to whether there is any safe criterion for the assessment of artistic values. Sometimes it is not the statue itself which is so much at fault as its location. One of the most inept choices of site appears to many to be that of the Washington statue dotted down at the corner of the National Gallery. That an accomplished piece of work like this, representing one of the finest characters in recent history, should look so little and undistinguished is a striking object lesson on how not to do it.

Civic Art. Distinguished amongst all recent efforts for town improvement is the work of the Birmingham Civic Society, but we imagine one reason of its success is the sympathetic support it receives for its suggestions from the city authorities. This body has now taken up the question of the design of telephone boxes (*see pp.* 186-7), and has suggested an improvement on the design accepted by the authorities, and which could be built at less cost. Opinion will, of course, be divided as to the comparative merits of the designs, but it appears obvious enough that a concrete box of good design might be both better and cheaper than the design accepted. It is said that the cost involved by these boxes may run to half a million pounds.

Culture and City Churches. What is culture? It may be held that one may be cultured in one particularly exclusive way, but the nobler view of culture is that of a wider vision which takes account of all the civilising influences of a general amenity. Can anyone be truly cultured who limits the value of City churches to their money values and overlooks their historic, artistic and sentimental values? Th fight for the City churches would not h so hard if culture were more widespread

Traffic Difficulties. The folly of pouring o big stream of north-to-sou traffic over another eas and-west (as is proposed pa the east end of St. Paul's) if it can b avoided, is pointed out by Mr. W. J. L Leverton. This cross stream difficulty avoided by the Farringdon-street traf passing under the Holborn traffic whi crosses it by a viaduct. This, of cours is seldom possible, but it has been su gested that a viaduct might be form from the west front of St. Paul's to som point westward, possibly in an axial li between St. Paul's and the Law Court This would be a tremendous relief to t congestion of cross traffic at the foot Ludgate Hill, but it would break throu a lot of valuable property. Years ag however, this might have been foresee as a splendid and not impossible poss bility.

Pictures in Stations. It has been suggested the League of Arts that might have pictures exhi ted in the waiting rooms our railway stations—surely not a b idea. But with the evolution of t poster we may find that the best poste might of themselves form attractive a excellent decorations for our statio There are some modern posters th should appeal strongly to everyone a especially to artists.

Discoveries at Windsor Castle So much attention is stowed nowadays on t search for ancient rema and anything on which ti has set its halo, that it not surprising that Mr. R. B. Roberts Chapter Surveyor at Windsor Cast had some interesting information to gi of such discoveries on the occasion of lecture, entitled "Odd Bits of Winds Castle," which was addressed to t members of the Windsor and Et Scientific and Archæological Socie Various finds to which he referred cluded particulars of an ancient doorw and door found in the old masonry of t great hall of Henry III. At the sa time, whilst roof repairs were be made, an old chimney shaft was brou to light constructed of limestone. Pa culars such as the discovery of the E sally port and other details were gi which, though small in themselves, ha interest archæologically, and may l to further elucidation of the plan of earlier thirteenth-century building.

Chelsea Old Church. An exhibition, small full of interest, of ei teenth and nineteenth c tury water-colour drawi and prints of Chelsea Old Church, w curiosities connected therewith, was h last week in Petyt House, Chelsea. Th

Coatbridge War Memorial Competition. Design Placed First: By Mrs. E. B. Hughes

bjects, with others which it is hoped ıay be given later, are to be housed in room in the tower of the church, which to be used as a little museum. The ictures show the church as it was at ifferent times, and illustrate the beautiful ıonuments it still contains and for which is deservedly famous. They include ıat of Sir Thomas More, the great hancellor, who rebuilt the existing south hapel, and the splendid Dacre monuıent, 1595, one of the finest specimens f the work of the period. The delightful ld church is indeed a treasure house of ıe monuments of four centuries, memoals of great beauty or historic interest. helsea Old Church dates back certainly the beginning of the fourteenth century nd perhaps even to an earlier date, for arts of the chancel are believed to belong the thirteenth century, some of this ork still remaining. The nave and wer, however, were built about 1675 he interior is exceedingly picturesque, nd is a bit of Stuart and Georgian ondon lovingly preserved.

Art and the Public.

The address on "Art and the Man in the Street," given by Mr. F. Richards at the Conference of Educaonal Associations, dealt with the abuse f advertisement in a fresh and convincing ıanner. Speaking of this abuse, he ated, "the serpent is raising its head, ven in Parliament-street. Look from ıe Houses of Parliament towards the enotaph and you have as a background f the Cenotaph an advertisement for ındles!" The River Thames is another ıstance of the abuse of advertisement. Vhen we think of the vision which it resents, its natural beauty and imressiveness seen dimly through the arkness of the night, in contrast to the lare of the streets and the violation to ny enjoyment of this through the preence of huge illuminated signs so disguring to its character, one wonders ıat it should have been tolerated so ong. We trust that the companies ıterested in these signs will take note of ıe growing hostility of the public to ıis usurpation of their rights, and that, llowing the good example shown in egard to field signs, they will be removed. moke-writing Mr. Richards characterised s a most undignified thing, which offends ı its disregard for the beauty of atmophere and sky and its irreverence to hat is so dear to others—the unolated tranquillity of the heavens. 'e think, however, the designation of the ublic hoarding as the "poor man's icture gallery" is rather misleading.

"That Messuage."

Other people's terminology is unfailingly tedious, and that of the lawyer, archaic and self-satisfied, peculiarly so. The description "that messuage" is irritating, almost unseemly.

Memorial to the Civil Service Rifles. Sir Edwin Lutyens, R.A., Architect.

[This memorial, erected in the Square of Somerset House, was unveiled last week by H.R.H. the Prince of Wales.]

At the same time, it is well for an architect to realise that the careful elevations and plans which he submits to a client are normally accepted as equally strange and bewildering. To the layman there is an unfamiliarity about greasy tracing paper, and the little curves where doors open—the sectional details—bear slight relationship to the home foreshadowed. Some architects have attempted to meet this difficulty by submitting sketches, or, more lately, by expensive little models, with a painful resemblance to Swiss chalet toys. Our experience is that an imaginary sketch, however artistic, does not bring conviction; while the lack of scale of a miniature model deprives it of all reality. It is better to rely on the working drawing and to explain it in simple language. In the long run, clients prefer what is authoritative, even if it be a little aloofly professional. "That messuage," however quaint the word, implies a qualified lawyer, and has a more reassuring sound to the owner than the "desirable residence" of the house agent's tag. We may be forgiven our technicalities if we do not allow them to become a fetish.

Repairs to Ancient Buildings.

One aspect of the preservation of ancient buildings that is very frequently ignored is the commercial value of these architectural activities to the community. An innkeeper in the neighbourhood of an English ruin will deplore the money spent by the Government upon its upkeep even while he earns his living catering for visitors attracted to the spot for no other purpose than to inspect the monument. It may not be desirable that England should live by her ancient works of art and exalt them into the prominent place such things occupy in some Continental cities, but it should be possible to recognise their monetary value to the community for what it is; a minor and secondary reason for their preservation, but still a valid one. This view seems to be accepted in Scotland, where very general interest and appreciation of the work done by Government on historic buildings has been aroused. To craftsmen the interest of repairs to ancient monuments is largely technical. Construction and appearance have so often been divorced in modern architecture that it is a very great pleasure to see that they are now being reunited in this particular branch.

GENERAL NEWS.

Belgium : Large Building Scheme.

The Commercial Secretary at Brussels (Mr. J. Picton Bagge) informs the Department of Overseas Trade that a large block of flats and offices, with an area of 7,000 sq. yds., are to be erected at a cost approximating 25,000,000 francs.

The plans will not be completed for some six months. In the meantime, United Kingdom firms desiring to offer fittings, furnishings, &c., may obtain the name and address of the company concerned, on application to the Department of Overseas Trade, 35, Old Queen-street, London, S.W. 1. Reference 21611/F.W./G.P. should be quoted.

The Avonmouth Extension.

The contract for the Avonmouth Dock extension at Bristol has been secured by Sir William Arrol & Co., engineers and contractors, of Glasgow and Westminster. The contract is valued at £554,000, and the work will give employment to thousands of men.

Blinded Soldiers as Telephone Operators.

We have pleasure in giving the following communication from St. Dunstan's :—

"It may not be generally known that telephone-operating has been most successfully taught to the blinded ex-Service men at St. Dunstan's. A number of these men have found employment with important business firms and organisations in London and the Provinces, and not a few employers testify to the superiority in many respects of the work of these men to that of a sighted operator hitherto employed. This may be because the efficient management of a busy switchboard demands full concentration and freedom from outward distractions, and here the handicap of blindness becomes a help rather than a hindrance. St. Dunstan's has several fully-trained men ready for vacancies. Perhaps some reader, opening up in new fields, or faced with a necessary change in present arrangements, might like to give a blinded soldier-operator a trial. If so, the authorities of St. Dunstan's headquarters, Regent's Park, London, N.W.1, will be glad to supply full particulars."

St. Dunstan's think, and we quite agree, that it is a case where the building trade may be able to give a helping hand.

"Harlequinade" Pantomime Souvenir Number.

The pantomime souvenir number of *Harlequinade* is full of good things. Those who did not see the recent show should get a copy, they cannot fail to find amusement therein; and at the same time learn what they missed by not attending the performance. Amongst the numerous articles is one entitled "The History of the A.A. Pantomime," an interesting account of its preparation and the difficulties which had to be overcome before its presentation. Included in the number is a double-page plate of original costume design for the production, in the manner, shall we say, of the late Lovat Fraser. Other articles are "Pantomime" verses "Peeps at an A.A. Diary," and the contribution from the Bristol School.

British Industries Fair.

At the forthcoming British Industries Fair, engineering appliances and building material will be shown at the Castle Bromwich Aerodrome, Birmingham, from May 12 to 23.

By a special arrangement between the railway groups and the Department of Overseas Trade, the organisers of the Fair, visitors will be able to make the return journey from anywhere in Great Britain to either Birmingham or London, at a cost of one-and-a-third of the ordinary single fare.

Full particulars and forms of application for space can be obtained from the Secretary, British Industries Fair, Department of Overseas Trade, Old Queen Street, Westminster, S.W. 1.

£1,000,000 Lithuanian Contracts.

According to the diplomatic representative of Lithuania in London, who has just presented his credentials, important openings for British trade may be expected shortly. They purport building a new railway from the port of Memel to Shavli, which will link up with the rail routes to all parts of Russia. Negotiations, we understand, are now in progress with British firms for the construction of this and other lines.

The new line will probably involve orders in Britain for 140 bridges, forty locomotives, 12,000 tons of rails and 800 wagons. It is expected that over £1,000,000 will be spent in this country on employment as a consequence.

COMPETITION NEWS

Hospital in America.

Fifty-one designs were submitted in the recent competition inaugurated by the *Modern Hospital* for a general hospital containing 30 or 40 beds, and the following awards have been made :—

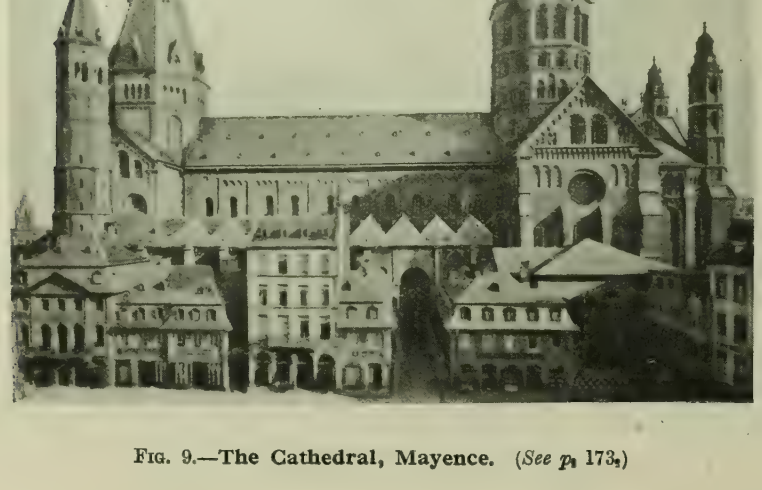

Fig. 9.—**The Cathedral, Mayence.** (*See p.* 173.)

Fig. 8.—**The Church of The Apostles, Cologne.** (*See p.* 173.)

First Premium : Messrs. Butler & Rodman, New York; second premium : Mr. John J. Roth, Los Angeles; third premium : Mr. Ernest Hoedtke, Cambridge, Mass.; first honourable mention : Messrs. Cervin & Horn, Rock Island, Ill.; second honourable mention : Mr. L. C. Dillenback, Urbana, Ill.

Ross-Smith Memorial Design.

Designs are invited (they may be submitted up to September 30) for a statue in bronze, and pedestal, in honour of Sir Ross Smith, the Australian airman who, in 1919, with his brother Sir Keith Smith, and two Australian mechanics made an aeroplane flight from England to Australia. The cost of the statue, delivered F.O.B. nearest port of embarkation, must not exceed £3,500, and the pedestal, to be executed in Adelaide, is not to exceed £600. First premium, £200; second, £100. Conditions can be seen at *The Builder* offices.

Proposed Municipal Offices, Kent.

The President of the Royal Institute of British Architects has nominated Mr. H. V. Lanchester, F.R.I.B.A., as assessor in this competition.

Newcastle Fire and Police Station.

Newcastle City Council has decided to hold a public competition amongst architects for plans for the proposed new police and fire brigade station on the Marlborough-crescent Market site. Buildings are to cover 2,465 yds. leaving the remainder for an open court yard. Three premiums, amounting in all to £900 will be offered for designs, and an assessor nominated by the President of the Royal Institute of British Architects and approved by the authority, will be appointed at a fee of £281 10s to adjudicate. Sending-in day, March 27. In our last issue it was stated that the cost of this work was estimated at £12,500; we believe the cost is likely to be about £125,000.

Other Competitions.

Other competitions still open include the following (the dates given are, first the sending in date, and second the issue of *The Builder* in which full particulars were given) :—Essay on Heating and Ventilating (Mar. 31 Nov. 9, 1923). Holmside Hospital (Feb. 14 Dec. 14, 1923). Industrial Designs (June Dec. 21, 1923). National Theatre (April 26) Monument to Sir Wilfrid Laurier (April 3 Dec. 14, 1923). Belfast Union Lighting (March Nov. 9, 1923). Dunfermline War Memorial (March 8; Dec. 28, 1923). Newcastle Concert Hall (March 1; Oct. 26, 1923).

TOWERS AND SPIRES.

By SYDNEY TOY, F.S.A., A.R.I.B.A.

IV.—CHURCH OF THE APOSTLES, COLOGNE.

In the districts of Germany bordering on the Rhine Romanesque architecture during the eleventh, twelfth, and thirteenth centuries developed in a special and particular manner; and this is observable as much in respect to the treatment of the towers over the crossings as in the general arrangement of the plan and disposition of the parts of the church itself. In the opulent and rapidly growing cities of the Rhine, such as Cologne, Worms, and Mayence, the churches were built on a magnificent scale during this period and usually consisted of a nave with its north and south aisles, a transept at either end of the nave, and a choir beyond both the east and west transepts. There was therefore a crossing at the west as well as at the east end of the nave and a tower was built over each of them. These were often flanked by two smaller towers, placed in line with them at the ends of the transepts or somewhat in advance, and the church was thus dignified by a group of six towers, prominence being given to either one or the other of those over the crossings (Fig. 9).

It is now somewhat difficult to ascertain the precise origin of the plan adopted in these churches, but among the archives of the ancient monastery of St. Gall in Switzerland there still exists a plan for a monastery, drawn about A.D. 820, the church of which shows a similar disposition of parts to that developed here. In respect, however, to the methods pursued in the treatment of the crossing and of the tower above it there can be little doubt but that they are based on types existing in Lombardy and in the north of Italy generally. With these types the Germans during the Middle Ages must have been thoroughly well acquainted, thanks to their commercial intercourse with Italy and the numerous military operations they conducted in that country. Doubtless, also, the traditions established by the Cathedral at Aix-la-Chapelle, built by Charlemagne in the eighth century and modelled probably on the Byzantine church of St. Vitale at Ravenna, had their influence on the open development of the crossing and its covering.

Many of the great Rhenish churches have suffered severely in the course of ages from fire and other destroying causes, and much of the work seen to-day is the result of comparatively modern restoration, but the church of the Holy Apostles at Cologne is a typical example of a Rhenish church of the Romanesque period. This church was built during the first half of the thirteenth century and has east and west transepts with a tower over each crossing as described above. The eastern end, in common with the churches of St. Maria in Capitolio and Great St. Martin, both also at Cologne, is triapsal or has an apse at each end of the transept as well as at the east of the choir. The tower stands upon the four great transverse arches of the crossing and is abutted at its base on all sides by barrel vaults, the barrel vaults being interposed between the arches and the semi-domes on the east, north, and south, and between the western arch and the nave vault on the west (Fig. 7). Immediately above the crowns of the transverse arches the tower is brought to octagonal form by means of trumpet-shaped squinch arches, and from this level it is continued upward through one low stage and terminated by an octagonal dome with a small lantern above. The tower therefore for its full height is open to the interior of the church and forms a great lantern over the crossing. Windows are pierced through the walls on the exposed sides between the roofs of the choir, nave, and transept, and corresponding recesses are formed on those sides covered by the roofs, a communicating gallery being continued all round by means of narrow openings between the windows and recesses. Generally the tower over a crossing in a Rhenish church during the Romanesque period appears to have been low and to have been carried above the roof line of the church only sufficiently to allow of a low external gallery with open arcade between that line and the roof of the tower itself; as in this example (Fig. 8) and as seen in the restored eastern tower at Mayence (Fig. 9).

The design of the eastern tower of the church of the Apostles, above noted, deserves especial attention from a constructive point of view. It will be observed, Fig. 7, that the system of abutment surrounding the great arches upon which the tower stands is remarkably powerful, and, if well built, would be of sufficient strength to support a superstructure of very much greater height. And, again, that the supports are so skilfully disposed that the open effect, which it is so desirable the crossing beneath should possess, is in no way impaired. Immediately above the great arches of the crossing the angles are relieved of all pressure, and the weight of all sides of the tower is thrown directly upon the arches themselves, as well as the weight of those sides at the angles, which is received by the squinches and deflected on both sides, as of the other four. The lateral thrusts exerted on the great arches are then received and neutralised by the four barrel vaults behind them, and which abut directly against and form a continuous support to them through the whole of their course from one springing point to the other. These are again retained at the further ends by the semi-domes of the apses and on the west by the vault of the nave. The vertical pressures are transmitted to the four great piers of the crossing.

The tower over the western crossing of this church is square, and is carried up to a considerable height, Fig. 8. At the summit it is finished by four steeply pointed gables, and crowned by a pyramidal spire set diagonally on the apses of the gables and having its sides continued down the junctions at their feet. Spires of this kind were common in Germany at this period, and are seen on the western towers of the cathedral at Andernach, on the tower over the western crossing at Laach, and elsewhere. They are constructed of timber and covered with slate. An example in this country exists on the tower of the church at Sompting in Sussex. The cathedral of Mayence, Fig. 9, dates substantially from the twelfth century, but it had suffered so much from fire and siege in the succeeding ages that considerable restoration became necessary, and was carried out during various periods in the nineteenth century. The tower over the eastern crossing was rebuilt about 1878. But the lower part of the tall tower over the western crossing, seen to the right in Fig. 9, probably represents the early work, though the upper part was restored after a fire in 1767. This work is doubtless of later character than the main body of the building, and is probably contemporary with the nave vault, about 1200. The construction, to the first stage above the roof line of the church, bears a resemblance to that of the tower of the church of the Apostles, but the internal width of this tower is about 10 ft. greater than that at Cologne, the lantern itself higher and the whole design on a more elaborate scale. The squinch arches immediately above the crossing are stilted and are not trumpet-shaped but of several orders, while corresponding blind arches are recessed in the adjacent walls to preserve the continuity of an arcade. The stage above is delicately treated with arches and detached shafts, and the covering over all is a true Gothic vault of eight compartments with ribs springing from shafts in the angles of the tower. This method of vaulting permits of an additional clerestory with windows on all sides, and it is this clerestory which is seen immediately above the roof line of the church in Fig. 9.

R.I.B.A. Prizes and Studentships, 1924.

The exhibition of drawings submitted in competition for the R.I.B.A. prizes and studentships, 1924, will be held in Gallery No. VI, at the Royal Academy, and will be open to the public until February 4, 1924, between the hours of 10 a.m. and 6 p.m. Students at the schools of architecture are cordially invited to visit the exhibition.

The prizes will be presented at the general meeting of the R.I.B.A. on Monday, February 4, 1924, at 8.30 p.m., at the Royal Society, Burlington House, W.1. Students are cordially invited to be present at this meeting, at which a criticism of the drawings submitted will be delivered by Mr. Henry M. Fletcher, F.R.I.B.A. No special invitation cards are required.

Manchester Grammar School.

The Governors have decided not to have a competition with regard to plans for the new school buildings to be erected shortly. They have appointed Dr. Percy S. Worthington, F.R.I.B.A., and Mr. Francis Jones, F.R.I.B.A., as their architects for the work.

CORRESPONDENCE.

A Commission of Fine Arts.

Sir,—I rubbed my eyes on opening my paper this morning to be sure I read aright. Was there then really yet another Committee of Taste already formed, and this time under Government auspices, and with grant of public money? And was it the last act of a moribund government to rush this thing through for fear of the views of the new, with its tendency to exchange panaceas for realities? I can only hope that with its greater respect for human liberties it will close down this Fine Arts Commission forthwith. Even in the account which fathers the announcement in a contemporary it is found desirable to adopt a very apologetic tone, as though somewhat ashamed of their own child. We are told that "The Constitution of the Fine Arts Commission saves it from any taint of bureaucracy" (from which it appears that the nature of bureaucracy is not understood) and that the "mature students or practitioners in the arts" are going to set up a standard of Taste. I seem to know the phrase, its iteration is so interminable. The whole trouble is well expressed by G. K. Chesterton when he tells us that "the cultured person does not seem to believe that the ordinary person is fit to be trusted outside a lunatic asylum." In order that this new Commission shall be quite secure, we are told it will itself "suggest the names of those whom it proposes for election or re-election."

But what of the arts themselves? To meet such a danger a "Liberty of the Arts League" seems the thing most needed, and I recall the announcement at the time when the Germans threatened Paris, "Citoyens votre patrie est en danger." If indignation is said to make poets it ought certainly to make artists, for the unconscious assurance of this Commission for the further capture of the freedom of the arts should bring every one of them to their defence. As a distinguished artist, expressing his view to me about it, stated, "the danger of eccentricity and extravagance in modern treatment amidst its new creative developments is nothing to compare with the sterilising influence of this reactionary proposal. We do not want this, no doubt well-intentioned, meddling of men, however distinguished, who are too much out of touch with present feeling and outlook to interpret for us what we need in art, and are too much identified with the old exclusive interpretations and official eminence at such a discount now."

The public and local bodies free to select their own advisers, responsible for their own advisers are much better guides. The recent case of Leeds will be recalled, where a timorous Town Council called in all the directors of all the National Galleries and others, creating out of them a really super-Committee of Taste, with the result that the particular scheme was turned down, and we may trust the Town Council learnt wisdom through the experience. A well-known writer on art pointed out some time ago that these sort of committees are perhaps the least likely to reach a wise decision. There will be found, no doubt, a certain number of accommodating persons to support this Commission, but artists should not, for the bottom is out of such remedies for the lack of art—if there is the lack. The unfortunate younger artists who are doing much of the best work, but too far off such official detachment, too undistinguished in themselves to be formidable, will perhaps fare badly unless adopting a correct and safe attitude. But they may feel reassured, as the public will, I believe, pay very little attention to a Commission which desires to guide its choice at the present time, and it is a thousand times better that they should not. Those who are going to protect the public from themselves in this way do not recognise that there is a new orientation in the arts, a new springtime of belief about them, and that all this outworn machinery of administering art by those who distrust it is being disintegrated every hour by public opinion.

And what justification is there for the supposition that this Commission will secure for us something better than that which the free exercise of public opinion and choice can secure for us already. Will this Commission manufacture better artists for us, or discover the best ones who resist this patronage and direction by those who do not believe in art enough to trust it? The matter is one much more difficult than any such Commission will resolve, and to suppose that the arts have only to be touched by the magic wand of this body to arrive at better things is to ignore the problems and changes concerned with real improvements. There can never at any time be much done to foster art, which is the flowering of life at its best, and like all the best things, it happens—but not by machinery. Such Commissions begin at the wrong end. Something more than this is required to interpret the spirit of this hour, which is reaching out to better beliefs and means to fly on its own wings, not under the tutelage of a Commission, which will fail, as it deserves and must fail, because it is not related to reality, and to the facts of life.

When the public and artists demand the best out of life, and trust the inspiration of their hearts to realise the kingdom that is within them, art will appear very nigh unto us, as the natural endowment of life directed to the best things. Why cannot we accept life a little more—which we should if we understood it better—and give up these everlasting appeals to machinery for a time. It would liberate us so much more than all this physic—physic, alas! while the physician himself is sick. If only our self-knowledge were greater we should be humbler, and it is through this humbler spirit that the arts will reach their new springtime and not through the coercion which the hard-mouthed would impose.

Isis.

Prizes and Studentships, R.I.B.A., 1924.

Sir,—May I be permitted to point out several rather misleading statements in the criticism of the designs sent in for the Soane Medallion which appeared in your issue for January 25.

With reference to those drawings signed "Phœnix," each dimension mentioned should be doubled as the drawings are to 1/16 in. scale and not to ⅛ in., as your critic seems to have thought, and only at the sides of the central tower is there a double row of flying buttresses. The same error in dimensions applies, I think, to the winning design also.

Phœnix.

Menai Suspension Bridge.

Sir,—In the letter on the proposal to build a reinforced concrete bridge across the Menai Straits, which he apparently broadcasts to a large proportion of the professional and general Press, Mr. Stott only demurred to the scheme on æsthetic grounds. In your issue for January 18 you published photographs of two, in my opinion, graceful reinforced concrete bridges, and as in his letter last week Mr. Stott did not again refer to the question of appearances, I presume I am justified in believing that these illustrations convinced him that it is possible to build "graceful" bridges in this material. He now changes his argument and states that at all events owing to the width and height required (500 ft. by 100 ft.) a ferro-concrete arch is "impracticable." If a ferro-concrete arch were impracticable there would obviously be no need for Mr. Stott or anyone else to worry about one being built, but I have taken the trouble to search the engineering Press and find references to and illustrations of the following reinforced concrete bridges which have actually been built:—New York, 720 ft. clear span, stated to be the largest reinforced concrete arch in the world; Minneapolis, 400 ft. clear span by 98 ft. high; St. Pierre, Rouen, 437 ft. clear span; La Balme, France, 320 ft. clear span. There is now being built at Bernard Loire a reinforced concrete bridge with a clear span of 570 ft., and no doubt there are many other bridges built of this material with a larger span and greater height than are required at the Menai Straits.

Mr. Stott quotes Professor Lethaby to the effect that the subject is too important to be decided by "the poverty of one mind." I quite agree—it is just that feeling which prompts me to reply to Mr. Stott's letters. The progress of science and construction will not be held back by what seems to be nothing but prejudice.

H. C.

London.

Filter Illumination.

Sir,—In regard to the photographs of filter illumination published in your issue of January 4, there is an error which I am sure you and your readers would wish corrected, viz., in place of "Paris Café," p. 4, read "Salon du Goût Français," Champs Elysées, Paris; and on p. 5 the installation illustrated is the Chinese Room, "Ritz-Carlton Hotel," Atlantic City, U.S.A.

At the moment in London there are permanent exhibits of filter illumination at Magnet House, Kingsway, also at Claude Harriss Galleries, 27, Old Bond-street, to which you and your readers are cordially invited.

Beatrice Irwin.

Gift for Science.

Cambridge University Senate accepted recently the offer of the trustees of the Rockefeller Foundation of New York, who have offered to furnish £100,000 for the building and general maintenance of the School of Pathology at Cambridge, and to contribute £33,000 toward the endowment of the school, provided the University can secure the remaining £33,000 necessary for the completion of their endowment.

The Home of General Washington, Washington, U.S.A.

THE ARCHITECTURAL ASSOCIATION.

Mr. Gilbert H. Jenkins occupied the chair at a general meeting of the Architectural Association, held at No. 35, Bedford-square, W.C.2, on Monday last.

New Members.

After the minutes of the previous meeting had been approved, it was announced that there were seven new nominations for membership, and the following were unanimously elected members:—

G. I. C. Highet	M. J. Evans
G. H. Brown	C. H. Roberts
A. R. F. Anderson	F. B. Armstrong
F. G. J. Place	

PRESERVATION OF OLD BUILDINGS.

Mr. Basil Oliver, F.R.I.B.A., then gave an address on "The Case for the Preservation of Old Buildings," which he illustrated with a large selection of lantern slides, divided into three categories: (1) Work destroyed; (2) imitative and conjectural restorations, and (3) buildings saved by careful restoration.

In the course of his remarks, he said preservation meant more than saving from demolition; it meant also saving from spoliation by a too drastic and often unsympathetic restoration after old buildings had been made secure from the clutches of the housebreaker. He thought an architect called in to advise about an old building should approach the problem in an entirely different state of mind from that in which he created designs for new buildings. Self-expression was not wanted in dealing with old buildings; highbrows did not always make good repairers, and indeed it sometimes happened that a really good builder, who knew his job and did it without any self-consciousness, did more good for the health of an old building than an architect with an overpowering desire to display his knowledge of styles and dates. It was often obvious what a building used to be like, but that was under no circumstances ever any justification at all for embarking on a scheme of completion. A mere fragment of genuine work gave him more pleasure, as being what it purported to be, than a conjectural restoration which was nothing more nor less than fraudulent misrepresentation.

Too much money was another fruitful source of harm. How little need be done to make the building safe, watertight, and usable (if not a ruin) should be the architect's ideal, not how big a job could one make of this or that restoration. Whoever had the privilege of such work should be conservative, have a "flair" for history, a love of and reverence for old things, but he should beware of too great an antiquarian knowledge. Too knowing and too ardent antiquaries had often been the most mischievous restorers.

In the repair of old buildings he did not think one's own preferences should be considered. Fashions in styles changed; what was considered good to-day might be the reverse to-morrow, and *vice-versa*. For instance, they could tolerate Jacobean work now, but just think of what a number of good Jacobean pulpits and other fittings were swept away and lost for ever during the fanatical period of the Gothic Revival! The misguided restorers of those days were goaded to action by the wave of Romanticism which the writings of Sir Walter Scott engendered.

On the whole he was an optimist about this question. The faithful and continuous work for close on half a century of the Society for the Protection of Ancient Buildings had done more than anything else for the cause of their heritage of old buildings. No less remarkable was the work of the more recent Ancient Monuments Board of H.M. Office of Works, with Mr. C. R. Peers as Chief Inspector and Sir Frank Baines as Director of Works. He knew it was the fashion to criticise Government departments, but he knew nothing but good of the one to which he had referred. In fact, when he heard that an ancient monument had been taken over in perpetuity by the Office of Works he heaved a sigh of relief and knew all was well.

In showing a slide of Kirby Muxloe Castle, where the work of preserving the walls of the gate house had been recently completed, he said careful examination of the walls showed that while the core was generally sound the greater part of the face work was in an advanced state of decay. One of the most serious defects encountered arose from the fact that the entire face of many of the bricks had, by the action of frost, been split from the body of the brick and had fallen away, and that many of the bricks that appeared sound were found, when tested, to be affected also and that the loose portions would fall off when tapped. It was evident that if all the loose faces were removed and the sound parts of the bricks were left in position the appearance of the walls would be ruined, while on the other hand to cut out the whole of the affected bricks and make good with new would mean refacing practically half of the area to be treated.

It was decided, therefore, that an endeavour should be made to retain the loose portions by means of a cementing composition, and the following procedure was adopted. The loose faces were very carefully removed and the fractured surfaces were thoroughly cleaned. The loose portions were then refixed in their original positions by means of a glue cement composed of 4 parts glue, 1 part boiled oil by weight, and 1 part oxide of iron. The adhesive was found to answer its purpose admirably and the result was in every way satisfactory. The presence of the new pointing undoubtedly would assist in the retention in position of the loose portions. The old bricks were very susceptible to the attack of rain and frost. Those lying on flat unprotected positions slipped and cracked into small fragments. No attempt was made to replace those portions of the bricks which had fallen away entirely.

Discussion.

In proposing a vote of thanks to the lecturer, Mr. F. Green (President of the Society for the Protection of Ancient Buildings) said during the last century there were very few cathedral churches which did not fall into the hands of Sir Gilbert Scott and other people who restored them by the use of faked work. The Society had done a great deal in educating in the right methods of preservation those responsible for ancient buildings, and that its existence was appreciated was demonstrated by the fact that the clergy were continually applying to it for advice. In its early days it experienced great opposition from the clergy and from architects; but now, he was glad to say, the majority of the members of the Committee of the Society were architects. Very few architects to-day carried on the abominable methods of faking old buildings which was at one time thought to be the proper method of preserving them, as though a modern mason working from drawings could do the same sort of work as the mediæval mason who was carrying out a labour of love into which he put his own individuality and his own ideas, and took a delight in his work.

In seconding the vote of thanks, Mr. A. R. Powys (Secretary of the Society for the Protection of Ancient Buildings said there were a great many different opinions as to the right method of repairing ancient buildings, and undoubtedly a very good argument could be put up for each of them, but it was necessary to consider all the different ideas in an endeavour to find the best treatment for each individual case.

Mr. Powell said the ancient buildings of England were an outward sign of the undercurrent which had kept the workers in touch with nature, and examination of them was more and more revealing how ample a scope that offered for personal experience and invention in work. If it were granted that such inventive handwork was indeed the foundation of any noble national life then the case for preserving every sign of it was proved. Not a thousandth part of the fuss made about modern art was made about the old—to the old artists it was work, and there was nothing to disturb its entirely natural flow. It was abundant everywhere; the people knew the work and no architect's drawings came to confuse and debase their nature-born instincts. He was quite certain that no one who was otherwise educated and intelligent but who had not worked with his hands at building could understand fully why an ancient building was precious. It was astonishing that architects were so seldom put through the workshops of their profession as well as through the offices.

Mr. H. B. Creswell said within the past five years he had had an actual example of what was going on. In a certain village the spire of the 14th-century church had suddenly taken on an entirely new form. Formerly it was close-jointed ashlar, but he found it was now dark-coloured rubble with very small stones and very large white joints—there were a great deal more joints than stones! The history of the change was that someone called at the rectory and pointed out that the iron lightning conductor was splitting the stone finial, and said that in a short time the stone would break and fall through the roof. The result was that he got the job of renewing the stone. He took it down and took it to a monumental mason, who very industriously copied it in a white sandstone. But before the new stone went up the journeyman mason told the rector that the whole spire needed repairing, and he was entrusted with the work. With no other advice the rector put the work in hand. Of course the very worst methods were adopted—the soft sandstone was scraped wherever it was beginning to rot and decay. One of the most interesting facts of the case was that the rector was a rural dean specially appointed to look after Church property, and the archdeacon to whom he (the speaker) wrote on the subject, replied that he was sure the rector would do nothing improper and took no further action. In some further remarks, the speaker urged architects and other professional men to take care that they did not become absorbed by commercialism. He expressed the opinion that in a very few years, if precautions were not taken, there would be very few architects in private practice, as the bulk of the profession might be employed by large commercial firms to turn out designs. He also urged architects to employ individual craftsmen on all their work.

Mr. R. H. Moberley and the Chairman also spoke.

Congestion of Traffic at Victoria Station.

Several letters have recently appeared in *The Times* drawing attention to the congestion of cab and other traffic at Victoria Station. Mr. W. T. H. Leverton, in a letter published on the 12th ult., makes the practical suggestion that the exits of the Brighton Section on to the Ebury Bridge should also be used as entrances, which could be done by constructing booking offices on the Bridge, thus making the station double-ended. Traffic from the south-west of the station would use the new entrances instead of proceeding up the Buckingham Palace-road to the existing ones, and traffic from the south-east would approach by way of Belgrave-road and avoid the congested Wilton-road. When the platforms of the S.E. and C.R. Section are lengthened, as proposed, they might be approached in a similar manner. Probably a third of the traffic, he considers, would be diverted from the existing entrances.

THE NORTHERN ARCHITECTURAL ASSOCIATION.

ANNUAL DINNER

THE annual dinner of the Northern Architectural Association was held at Newcastle on January 23. The president, Mr. W. T. Jones, occupied the chair. There was a large and representative attendance, but owing to transit difficulties the following were unable to be present and forwarded expressions of regret: Mr. J. A. Gotch, President of the Royal Institute of British Architects; Mr. F. Jones, President of the Manchester Society of Architects; Mr. E. J. Partridge, President of the Society of Architects; Mr. C. McArthur Butler, Secretary of the Society of Architects; Mr. Glen Dobin, President, Liverpool Architectural Association; the Earl of Durham, Lord Mayor of Newcastle; Councillor Stephen Easten, O.B.E.; Mr. A. Keen, hon. secretary, Royal Institute of British Architects; Mr. Ian McAlister, secretary, Royal Institute of British Architects; Alderman A. B. Plummer, J.P.; past President of the Association, and others. Those present included: The Deputy Lord Mayor of Newcastle, Dr. W. Simpson; the Sheriff, Councillor A. W. Lambert; the Mayor of Durham, Councillor E. Laidler; the Mayor of Sunderland, Councillor G. S. Lawson; Sir Theodore Morison, Principal of Armstrong College, Newcastle; Mr. J. S. G. Pemberton, President of the Council of Durham College; Mr. J. W. Alder, President, National Federation of Master Painters and Decorators; Mr. J. P. Allen, F.S.I., President of the Northern Quantity Surveyors' Association; Mr. Thomas Bertram, J.P., President, Newcastle and Tyne District Building Trades Employers' Federation; Mr. A. E. Brookes, O.B.E., M.I.C.E., M.Inst.T., President, County Surveyors' Association; Mr. J. T. Cackett, J.P., hon. treasurer and past President of the Association; Councillor J. Carse, M.B.E., President of the Northern Counties Federation of Building Trades Employers; Mr. J. F. H. Checkley, assistant hon. secretary; Mr. Percy Corder, D.C.L.; Mr. R. Burns Dick, past President; Mr. C. S. Errington, past President; Mr. G. H. Gray, hon. secretary; Mr. W. H. Hope, secretary, Northern Counties Federation of Building Trades Employers; Dr. Harold Kerr, O.B.E., M.A., M.D.; Mr. J. A. E. Lofthouse, chairman of the Tees-side Branch of the Association; Mr. T. R. Millburn, past President; Lieut.-Colonel G. Reavell, O.B.E., Vice-President; Mr. A. Robinson, M.A., D.C.L., Vice-Chancellor of the University of Durham; Mr. W. E. Stairmand, past President of the Northern Counties Federation of Building Trades Employers; Mr. F. N. Weightman, M.A., hon. librarian; Mr. J. B. Wilkinson, immediate past President of the Worshipful Company of Plumbers; Mr. Stephen Wilkinson, A.F.C., President, York and East Yorkshire Architectural Society.

LIEUT.-COLONEL REAVELL, proposing the guests, extended a cordial welcome to the visitors. The world to the architect, he said, was divided into three classes, the client, the architect, and the builder, and they were very glad that all three could meet on a common platform of friendship. It had been said others could beat them for civic architecture, and that the Americans could beat them for commercial architecture, but the domestic architecture of this country was acknowledged as being the finest in the world. He deplored the passing of the time when every well-educated Englishman considered it part of his education to be able to speak learnedly on the style of architecture of his day, and expressed the hope that that time would return.

MR. ROBINSON and COUNCILLOR CARSE responded, following which SIR THEODORE MORISON gave the toast of "The Deputy Lord Mayor of Newcastle, and the Mayors and Corporations of the Province." He said the people of Edinburgh preserved with pride their traces of local history, and it was scandalous to find structures of interest and worth in Newcastle allowed to become begrimed, and being degraded into slums. In regard to the question of the beautification of industrial townships, raised locally by a recent address by Colonel Mitchell, who had proposed the erection of municipal and other buildings on the Town Moor, he hoped the suggestion, if tackled, would have the enthusiastic co-operation of the Northern Architectural Association, and all engaged in town planning.

Responding, DR. SIMPSON referred to the proposed construction of a great new thoroughfare from Low Fell, Gateshead, to Gosforth, through Newcastle, and said local architects could assist in making it a credit to the North. They also hoped to establish Newcastle as the metropolis of the North, and to erect buildings of architectural beauty. The MAYORS of DURHAM and SUNDERLAND also replied.

DR. PERCY CORDER proposed "Architecture," and said by the traditions of English education, the practical teaching of fine art was usually carried on at institutions having no university connection, and, as a result, both schools of art and the universities lost something by the dissociation. By amalgamating with the North of England Society for the Promotion of the Fine Arts 36 years ago, Armstrong College had broken away from that tradition and had established a Department of Fine Art, and had for a considerable period been unique in the country in this respect. Painting, sculpture, crafts, engraving, printing, and architecture were taught there, and he mentioned it was now possible to take architecture as a subject for the Durham University Degree of B.A., by means of a three years' course, or a diploma course of similar duration. The machinery was, therefore, in existence, but for some reason or other no student had yet found it possible to enter for either course. It might be that principals found it difficult to exempt youths from attendance at their offices, but he thought the architectural profession should visualise a succession of young men leaving the University at the age of 20 or 21, having completed the first half of their training, or just past the inter. R.I.B.A. stage, and coming to the architects for two years' part time study, at the end of which the young men would hold either the degree of B.A. with honours, or the diploma of the University in Architecture, whilst at the same time satisfying the requirements of the Royal Institute, and becoming Associates of the Institute. These were the recruits of the profession, and such recruits as a learned profession would have every reason to be proud, and the North-East Coast might very easily, after a few years, find its junior ranks filled with men both with B.A. and R.I.B.A. after their names.

He recognised the self-denying ordinance to which the profession must submit itself, by ceasing to recruit at an early age and, instead, advising entrants to take the course, which had been approved by the R.I.B.A. and rendered possible by the assistance of the Northern Architectural Association and their co-operation with Armstrong College. The period would soon pass, and the profession would find itself with a dignity which was its right. There was never a time when the well-educated, all-round man was more needed in the professions, and he was glad to be able to say as regards the College classes in architecture, that there were now as many men as ever attending the day classes for days per week, whilst the college was taxed to capacity in the evening classes.

So far as the city and neighbourhood were concerned, the accomplishments of local architects gave no fear of adverse comparison with the men of the past, and he instanced several buildings now in course of erection at Armstrong as forming a very noteworthy group.

Dr. Corder, whilst deploring unreasonable multiplication of societies, expressed the need, in a city like Newcastle, for some competent body to serve in an advisory and consultative capacity to the Corporation in the consideration of important public buildings before designs received final approval. He predicted a busy and useful future for their ancient profession in the North of England, and coupled with the toast the names of Mr. Gotch, the first man from the provinces to be elected President of the Royal Institute of British Architects; all allied Societies, and workers for the advancement of art.

THE PRESIDENT, who replied, assured Sir Theodore Morison of the sympathy and assistance of the Northern Architectural Association in the event of the utilisation of the Town Moor for the purpose suggested by Colonel Mitchell, and said he was very strongly in favour of advisory committees to Corporations, and mentioned that the Institute was giving the matter consideration. It seemed very helpful and desirable to have some such body to which a Corporation could refer their architectural questions. He did not suggest that they should, of course, dictate, but merely advise, and at Birmingham such a committee was in operation and rendering excellent work. The whole body of architects was very much interested in education at the present time, and it was generally agreed that it was most necessary for architects to have higher education in the future than in the past. Personally he did not think principals tried to stop pupils attending courses, but rather that the question was one of money, and he thought these students should be encouraged.

Until the man in the street, and the general public, were able to distinguish between good and bad architecture, the profession would never attain to its correct status, but he did not blame the architect for bad architecture, for he had to work to the orders of his clients, and until the latter class was capable of differentiating between the good and the bad, and of choosing the man capable of doing good work, the profession could not soar to its greatest heights. Architecture, probably the oldest of the arts, was the least noticed and appreciated.

THE R.I.B.A. AND THE SOCIETY OF ARCHITECTS.

RECENT reports in the daily press intimate that there may shortly be a closer union between the Society of Architects and the Royal Institute of British Architects. We understand that for some months past negotiations have been proceeding between the Councils of the two bodies, although, it is stated, even if the presiding authorities arrive at some arrangement it will probably be some weeks before anything definite is settled. Before any agreement which might be arrived at by the Councils of the two bodies is put in operation, it would, of course, have to be approved by general meetings of the members.

Certain members, it is stated, have strong objections against the proposal. We understand that the terms proposed are similar to those brought forward in 1919. If fusion does take place, a Bill for the registration of members of the profession would, no doubt, be promoted.

The scheme for fusion was first proposed in 1911, but was rejected by members. From 1919 to 1922 discussions arose, and much electioneering and organising work was done by those who favoured the project.

ITALIAN TRAVEL NOTES.

II.—MILAN AND DISTRICT, WITH BRESCIA.

By THEODORE FYFE.

Milan is a wonderful place. A cultivated Italian once said to me, "There is nothing at Milan except the Cathedral." This is an extraordinary statement. Rome, Florence, and Venice are unapproachable; but Genoa, Turin or Naples—all first-class towns in point of size—cannot equal Milan in general interest; though there is an atmosphere of eighteenth-century completeness about Turin which some sympathetic student of to-day or to-morrow might do well to cultivate thoroughly.

Apart from its intrinsic value, Milan as a centre is almost unsurpassed in Italy. Rail and tram routes radiate from it to Saronno (Como), Monza (Bergamo), Lodi, Pavia, Abbiategrasso, Novara, and Busto Arsizio, working clock-wise from the north, and omitting the main line, east, to Brescia and beyond. All of these places are well worth visiting.

Let us now examine Milan itself. As all trams radiate from it, we may mention first the Duomo—a gorgeous and remarkably interesting edifice—but there are many other things. The mediæval Castello is a good example of its class. The Great Hospital has one of the finest courtyards in Europe; Santa Maria delle Grazie, besides being a very beautiful church, contains in its refectory the "Last Supper" of Leonardo da Vinci; the Church of San Maurizio (Monastero Maggiore) contains whole walls of frescoes by Luini; San Satiro has the famous octagonal sacristy of Bramante; San Eustorgio, the nobly placed tomb of St. Peter Martyr; and Sant' Ambrogio is a Romanesque basilica of first-class importance complete with its atrium. There are many other churches of interest—the domed Church of Sant' Alessandro*; Santa Maria della Passione, with its octagonal cupola; San Nazaro; and others.

The student will find a great deal in these buildings that he can sketch and measure. He will do well also to study such things as the setting of the "Cenacolo" of da Vinci, which is not only worth going many miles to see in itself, but is part of a great scheme of decoration in a remarkably fine room. He will also do well to visit the Brera, the Biblioteca Ambrosiana, and the Museo Poldi Pezzoli. The Brera is one of the great picture galleries of Europe, with many unforgettable paintings, including perhaps the most beautiful early Raphael in existence.

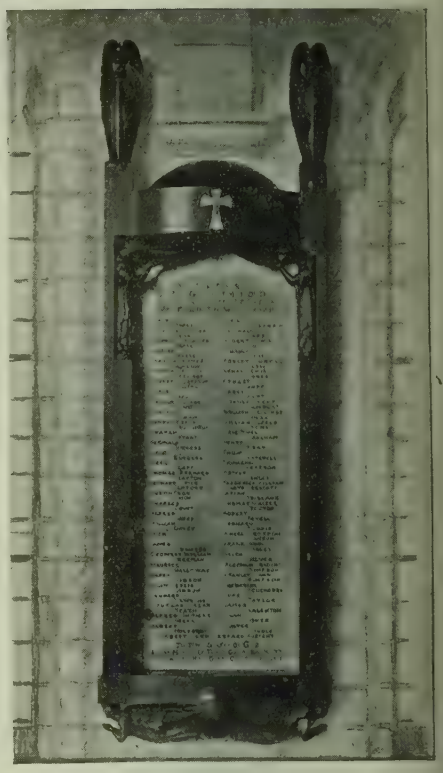
Coming now to the neighbourhood of Milan, we can get to Como by the line going almost direct north, but first we must stop at Saronno. The village is primitive, but has (or had) a possible inn. The Church of the Santuario della Vergine contains some of the freshest and most delightful early Renaissance work in North Italy. Its truly beautiful dome is a joy. Externally it is polygonal, in delicate coloured marble with a flat-pitched tiled roof and lantern; internally it is circular with arches, spandrels and drum decorated with fifteenth-century arabesques largely on a black ground; frescoes by Luini and Lanini; and above, one of the famous dome paintings of Italy—the heavenly host by Gaudenzio Ferrari. The architectural setting of all this is extremely delicate and pure, while, in the paint work, the gracious influence of Luini seems to permeate the place and culminates in his beautiful fresco, the "Marriage of the Virgin," in the passage leading to the choir.

Como, besides its wonderful cathedral, has the interesting two-domed Church of San Fedele† and the stately Romanesque Sant' Abbondio, with its twin towers and shafted semicircular apse. Unless the student desires to work in Como, the whole of the town can be seen in a day, but it certainly must not be missed.

Monza, a town of great historic interest, contains the famous iron crown of Lombardy, a relic of the twelfth century. The Cathedral is mostly fourteenth-century Gothic, in black and white banded marble, five-aisled, and containing some excellent ironwork. When I visited it, the exterior was undergoing extensive repair and was covered with scaffolding. There is a good Broletto at Monza, as at Como. There is a sketch of the latter in that admirable work, Street's "Brick and Marble in the Middle Ages," which every student should pick up if he can.

More important as a whole than any of these places is Pavia, which certainly demands a stay of several days, as from it the Certosa can be visited. But Pavia is a pleasant town to stay in, with a wide blue river spanned by a splendid mediæval bridge. It has fine subjects for water-colour work. From the other side of the river the roofs and towers of the mediæval buildings rise picturesquely, dominated by the imposing Torre del' Cittá. In fine weather Pavia is a place to revel in, full of sunny streets and mellow brickwork. In it we get right into the atmosphere of Lombard brickwork. The most important building at Pavia is the remarkably fine cruciform church of San Michele, with its octagonal dome at the crossing set on squinch arches, crowned externally with the flat pitched roof of Lombardy. The mellow stonework of the eastern apse gives one of the most perfect pictures of texture in architecture that I can remember. The Carmine is another fine church at Pavia, in red brick and terra cotta with pointed arches. The cool effect of the plastered vaults of these churches contrasting with the warm red brick, as well as the methods of lighting, are well worth study. The Duomo is good in its massing and has for a campanile the noble "city tower" referred to above.

It is not easy to write about the Certosa, but it is a wonderful place to visit. One cannot help feeling glad that such work as the delicate marble panelling of the west front has been done, and the colour effects are lovely. Internally, the inlaid marble work of the chapels and the great bronze screens are miracles of finish. The cloisters, in brick and terra cotta, are very beautiful. The setting of the Certosa, its gardens and such-like, all heighten its effect. In its way—a very graceful early Renaissance way, mixed up with Gothic elements—it is unique in Italy, and its craftsmanship in many fine materials is superb.



On the way back from Pavia to Milan, the student ought to stop at Chiaravalle, to see the remarkable early thirteenth-century church there, mentioned and illustrated by Fergusson in relation to Arnolfo's dome at Florence. Here is a true octagonal Gothic dome, a pyramidal composition outside, finishing with a Lombard spire like that of San Gottardo at Milan. It rises finely out of a lovely country, something like Ely, with which it has affinities. One can clamber up staircases, more or less perilous, right up into the spire, and get wide views. When I first went to Italy I was reminded of the importance of this church. It merits careful investigation, and would amply repay a student who had time to spend on it. It is probable that lodging on the spot is primitive, but as it is only 5½ miles from Milan it could easily be reached by bicycle. Besides its unique dome, the church has splendid mid-fifteenth-century woodwork.

Busto Arsizio and Abbiategrasso have churches with some resemblances to that at Saronno, ascribed, as usual, to Bramante; and the former has frescoes by Gaudenzio Ferrari. The Renaissance Church of the Incoronata at Lodi is also well worth seeing. Bergamo should certainly not be missed. It is only some 15 miles beyond Monza, but I have never been able to fit it in. Its Colleoni Chapel in the Church of Sta. Maria Maggiore is celebrated for its beautiful tombs. Several details of the church are illustrated in Oakeshotts' book of drawings.

We will now suppose that the student is leaving the Milan district and proceeding slowly towards Venice. The first town of importance on the route is Brescia, and a very fine town it is. The Municipio ("La Loggia") has a richly ornamented façade of the full Renaissance with noble great features in it, facing the great square of the town. There are several interesting churches, and the picture lover will be rewarded by seeing Moretto and Romanino at their very best. Altogether, Brescia is delightful and picturesque, and one can stay many days in it with enjoyment. The rising ground above the town is finely laid out as a public garden, from whence sweeping views of Lake Garda and the country near it can be obtained. The Broletto is one of the best in North Italy, and the museum likewise. This is partly contained in the remains of a Roman temple and is celebrated for its classical antiquities, including a famous bronze "Victory."

A third article in this series will deal with Verona, Vicenza, Padua and Venice.

ILLUSTRATIONS.

Plaza Constitution, Buenos Aires.

This station is the terminus at Buenos Aires of the Buenos Aires Great Southern Railway, and the scheme illustrated was for entire rebuilding. The scheme is to be carried out in a modified form entirely by the Railway Company's own staff. The materials employed are granite for the ground floor, with a brick and plaster super-structure. The climate permits complete freedom in the treatment of this material, with great advantage from an economical point of view. Mr. Arnold Mitchell is the architect.

Memorial to the Missing, Port Thewfik.

Other illustrations of this memorial were given in our issue for January 11. Sir John Burnet, A.R.A., is the principal architect.

Swansea Masonic Temple.

The design for a Masonic Temple at Swansea, by Mr. A. F. Webb, M.S.A., was placed second in the recent competition. The first premiated design in this competition, by Messrs. Willmott & Smith, was given in our issue for December 21, 1923.

Ciborium Altar War Memorial, St. John the Evangelist, Balham.

The arrangement of the walls and doors at the east end of the aisles of the church precluded the ordinary altar and reredos. During the war a small temporary altar was placed and used in the north aisle, and it was decided to erect a permanent one in the same position as the parish war memorial. This was designed and supervised by Mr. A. E. Henderson, F.S.A., and executed by Messrs. John Garlick (1910), Ltd.

It is of rather unique character, and yet sufficiently historical in style to be in keeping with the Gothic design of the church. It is a wood design throughout; no imitation archings are used, but only uprights and beams. The three angels at the top of each post support the superstructure, and the doves carry the cornice. The roof is octagonal and carries a cross of Byzantine design. A complete chapel has been arranged under one roof in a small square of only 8 ft., the whole making a complete Ciborium.

The photographs were taken shortly before the altar decorations were fitted and the dedication. Mr. Henderson has also designed the roll of honour, painted on marble, in a carved mahogany frame. affixed to the pier between the aisle windows.

THE LAW RELATING TO BUILDING.

By W. T. CRESWELL, Lic.R.I.B.A., F.R.S.I. (Barrister-at-Law).

IV.—The Scope and Extent of the Architect's or Surveyor's Authority.

The lack of personal skill which usually induces the ordinary prospective building owner to employ an architect to prepare designs, plans, &c., also suggests to him his own incompetence to supervise, to successful completion, the work undertaken by the builder. Hence, under ordinary circumstances, the employer relegates to the architect who makes designs, &c., for building works, the supervision of the builder's work.

In this country the custom is for the building owner to employ, severally, an architect to design and supervise, and a builder to provide materials and labour for erection and completion of proposed buildings.

Hence, there comes to an architect or surveyor the position of agent of the employer in relation to the builder; his legal description being "general agent"—see Kimberley *v.* Dick (1871), L.R. 13 Eq. I. As a result of this relationship, questions frequently arise as to the employer's liability for the acts, or orders, of the architect or surveyor, towards, or given to, the builder. Decision regarding such questions depends on whether such acts or orders fall within the limits of the usual authority of an architect or surveyor, or of any special authority given him by the employer.

In general, if an agent falsely represents that he has an authority which he has not, and thereby induces another person to act on the faith of his misrepresentation, there is a fraud; in respect of which, if the person so induced to act is thereby injured, he can recover damages. So then, when an architect or surveyor exceeds his authority without the knowledge of the builder, and causes the builder to provide labour or materials, or to make alterations, without the authority of the employer, the architect is liable, in the event of any objection raised by the employer, to an action for breach of warranty of authority—see Randell *v.* Trimen (1856), 18 C.B. 786. He is also liable to a charge of neglect if he does not show the same degree of skill in supervision to completion of the works as he showed in the preparation of designs, plans, &c.

Questions most frequently arise in the following categories:—

(*a*) Variations from plans. (*b*) Omissions from, and additions to, the contract. (*c*) Employment of a quantity surveyor. (*d*) Certificates granted by the architect.

In a carefully prepared contract, there would be provisions to meet all these eventualities, and any dispute taken before the Court would be settled by a construction of such provisions according to the ordinary rules of construction and applicable in such cases. Any alteration, variation, omission or addition in relation to plans, which during construction appears desirable in the view of the architect or surveyor, should not be carried out until he has sought and obtained ratification and written instructions from the employer; failing which, he may be held liable.

In the case of Sharpe *v.* The San Paulo Railway Co. (1873) 8 Chancery App. 597, where the plaintiffs were constructing a railway for the defendants, and the contract provided that the engineer's certificates should be in writing, it was held that the plaintiffs could not maintain a claim against the defendants merely on verbal promises given by the engineer. Lord Romilly M.R. said "it was quite clear that the engineer had no power to vary the contract, he had power to give directions . . . within the limits of the contract, and if the contractors thought that things were not within the contract they were not bound to do them."

In general, therefore, the architect or surveyor is the agent of the employer for all purposes in connection with the work to be done and within the limitations of the contract. If his authority be further limited by the employer, then the contractor must be informed regarding such limitations; see Kimberley *v.* Dick (1871) L.R. 13 Eq. 1. Also see Betts *v.* Pickford (1906) 75 L.J. Ch. 483, where an architect, who was supervising the erection of a warehouse, permitted roof timbers and stanchions, from an adjacent building also in course of erection, to be inserted into the said warehouse building; it was held that he had exceeded his authority, Kekewick, J., remarking "What is within the scope of an architect's authority I am not called upon to say, but I will say this much, that I apprehend his authority is strictly limited by the nature of his employment; that is to say, as defined by any letters or agreement constituting his employment."

Any person asking for tenders from contractors does not imply that the proposed work can be successfully executed in absolute accordance with the plans, specifications, &c., provided; nor, in fact, has the architect or surveyor any authority to warrant to the contractor the sufficiency of his plans, or that the work can be executed from them or that the bills of quantities are correct. Also, when a clause is inserted in a contract whereby the employer disclaims responsibility for the accuracy of statements and information which he or his architect or surveyor supplies to the contractor, and as to which the contractor is to satisfy himself, such a provision will not exempt the employer from liability in respect of statements or information recklessly or fraudulently made or given by himself, his architect or surveyor, to the contractor. Of course, where the architect or surveyor is at fault, the employer has a remedy against him if the contractor has been able to maintain an action against the employer; see Pearson *v.* Dublin Corporation (1907) A.C. 351.

Omissions from and Additions to the Contract.

Where omissions have been made in the contract documents, it is the duty of the architect or surveyor first to bring these to the notice of the employer, then obtain his written authority to order such omissions as extras on the contract, if they are works reasonably necessary to carry out the contract as signed; see Sharpe *v.* San Paulo Railway Co. (1873) 8 Ch. App. 597.

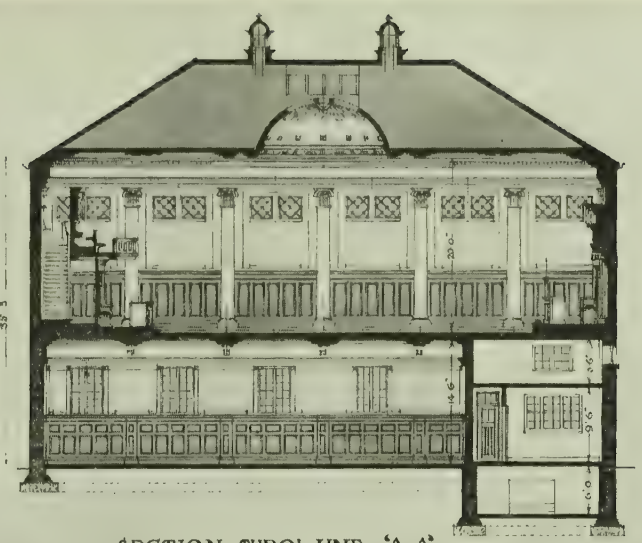
Impracticable Plans.

If the architect's plans prove to be impracticable, he must obtain the authority of the employer empowering him to order such supplementary or extra work as shall render them practicable see; Tharis Sulphur & Copper Co. *v.* McElroy (1878) 3 App. Cases 1040.

Extra Plans, Working Drawings, &c.

An architect has usually, under the contract authority to furnish further plans, working drawings, and other detailed information, during, and to aid, the progress of the work; but this does not entitle him to vary the work as originally set out in the contract, unless by express authority of the employer in reference to any item varied; see Rex *v.* Peto (1826) and Cooper *v.* Langdon (1841) 9 M. & W. 60.

Substituted Work by the Contractor.



If a contract gives certain powers, they must be strictly exercised. So, if the contractor substitute any work for that stipulated in the contract, he cannot claim for the work so substituted; but the architect for the employer is entitled to demand the removal of such substituted work and the installation of the work stipulated in the contract. This holds even though the substituted work is better than that stipulated; see Forman *v.* The Ship "Liddesdale" (1900) A.C. 190.

There is usually, in building contracts, a provision for all variations and orders given by the architect to be in writing; but all such written orders must be within the limits of his authority as architect; see Steel *v.* Young (1907) S.C. 360. For example, the architect cannot give an order that brickwork shall be in lime mortar when the contract specifies cement mortar, saving only under the consent of the employer; and, in all cases, such consent of the employer should be obtained in writing.

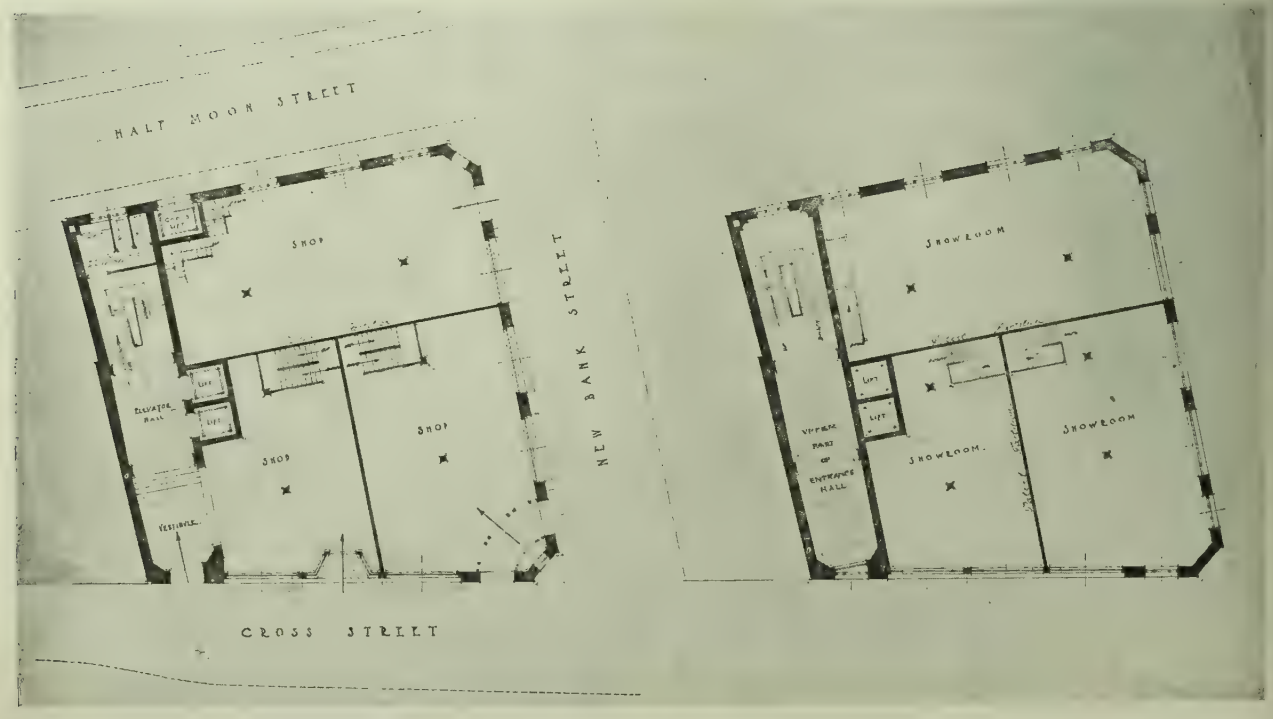
A COMMISSION OF FINE ARTS

The following Commission, consisting of nine members, has been appointed by the King on the recommendation of the late Prime Minister—the last public act of his Government. It will be on the lines of the American Fine Arts Commission, which has been in existence since 1910. The Earl of Crawford and Balcarres (chairman), The Marquis Curzon of Kedleston, Sir Aston Webb, P.R.A. (architect), Sir Reginald Blomfield, R.A. (architect), Sir Edwin Lutyens, R.A. (architect), Mr. Alfred J. Gotch, P.R.I.B.A. (architect), Sir George Frampton, R.A. (sculptor), Mr. D. Y. Cameron, R.A. (painter), Mr. T. H. Mawson (President, Town-Planning Institute).

According to statements in the Daily Press the status of the Commission is consultative, with no power of veto, and with no statutory powers in the first instance. Its advice may be sought by the Government or any authority of standing on the location of statues, fountains, and monuments in public squares, streets, and parks, both in London and the provinces, and upon the selection of designs for statues, fountains and monuments, or on any artistic question in the open air, such as elevations of buildings, town planning, and landscape gardening in public parks, and the internal decoration of public buildings.

The Commission will have the power to co-opt members or appoint a special committee, if thought advisable, for the study of any special problem. After the first three years from the establishment of the commission two members will retire in turn each year, but will be eligible for re-appointment, if thought desirable. The services of the members of the commission will be honorary; office, secretarial, and travelling expenses alone being allowed.

Possibly the most urgent work of the Committee will be in connection with architecture. There have been many occasions during the last few years when a Fine Arts Committee, if it had been in existence, could have used its influence to prevent many distressing mistakes in the building, and rebuilding, of London.



It is doubtful whether the Commission, although only acting in an advisory capacity, will be able to cope with the mass of work which will fall upon it. Perhaps it may be decided t form local Commissions, of a similar calibre t the parent Commission.

It will certainly go a very long way toward the very necessary work of tidying-up London—from, on the one hand, the prevention of archi tectural atrocities, to, on the other, the small but significant, matter of the correct naming c streets. It is to be hoped that they will be abl to persuade local authorities to follow th example of a certain south-west London area which, in quite a small compass, can boast c such names for its streets as Elfindale, Deepden Sunset, and Afterglow. It is in a neighbourhoo closely connected with the "Great and Goo John Ruskin." There is little excuse, in civilised country, for such names as Crab an Bottle-streets.

The London County Council has recently bee urging the Borough Councils to make use of th Advertisements Regulation Act to regulate th hoarding nuisance. Strengthened by the Fi Arts Commission, it should surely now b possible to control the many glaring poste which spoil some of London's most beautif buildings—North, East, South and West.

THE FUTURE DEVELOPMENT OF LONDON.

SIR ASTON WEBB, the President of the Royal Academy, in giving the Friday Discourse at the Royal Institution on this subject said, in the course of his remarks, that taking into account that some thirty of the forty million inhabitants of England and Wales lived in cities, the development of towns was, obviously, a matter that must affect for good or ill the health and prosperity of the people. The regional planning, or zoning, necessary for organising town development in connection with the adjoining country, and neighbouring towns and villages, was not a new idea imported from America, but had been practised by the Romans, who had formed six main arterial roads out of London. The London Society, however, during the war had prepared a plan of arterial roads in and out of London which had since been found useful.

He mentioned the railway companies, with their separate stations, as showing the casual way in which London had grown; and remarked that at Victoria two stations had been built side by side divided by a wall, and it had only just occurred to the companies to get rid of the obstruction. The West-end of Edinburgh, and parts of Bath and Buxton, were excellent examples of what forethought and design could do. Several Royal Commissions had recommended uniform and concerted action, and the preparation of a comprehensive plan, yet nothing had been done. The Metropolitan Board of Works had been founded, under the chairmanship of Sir J. McGarel-Hogg, in 1870 and they had been responsible, he considered, for spoiling Piccadilly Circus and forming the very inadequate Shaftesbury-avenue. However, they had created the Thames Embankment, perhaps the finest improvement ever carried out in London. The London County Council, which succeeded the Metropolitan Board of Works, had done good work, but their activities were lessened by the limited area and the powers of veto given to the Borough Councils in their areas. Under Mr. John Burns's Town-Planning Act of 1909, plans for the development of unbuilt areas in Greater London for not fewer than 20,000 inhabitants were being prepared independently of any general scheme, and this might lead to even a worse muddle.

Sir Aston Webb then dealt with the work done by the London Society, the London County Council, and the Royal Institute of British Architects, and said he maintained that the first essential requirement was a complete survey of present conditions, showing in diverse colours public buildings, churches, schools, dwelling houses, commercial buildings, markets, railway stations, parks, playgrounds, &c., and then, after a careful consideration of future needs, the final preparation of a comprehensive scheme. It was gratifying, he continued, to know that there was reason to believe that this project would have the sympathy of the Ministry of Health, who had on their staff many well-known and expert town-planners. Birmingham, Manchester, and other cities were showing the way, and London, if they were not careful, would be left behind.

He made an appeal for the linking up of the southern and northern termini, the passage of goods traffic across London underground, the construction of good arterial roads—a few even 150 ft. wide—arranged for two rows of trees to enclose them, and on the outside two roads for slow traffic. London bridges also required comprehensive consideration and treatment. The congestion of traffic round the docks and Covent Garden was a typical instance of abuse, and the railway congestion was even worse than the road congestion. It was desirable that suitable classes of buildings should be erected on certain sites as occasion offered. Factories in the majority of cases could usually be removed outwards, with advantage to themselves and the community, for it was an anomaly for drain-pipes to be burnt immediately opposite the Houses of Parliament, or next door to Lambeth Palace, or that military barracks should occupy some of the best sites overlooking the Royal Parks.

In reference to the smoke question, Sir Aston Webb said London would never be the city that it deserved to be until the smoke difficulty was got rid of. He recommended the encouragement of the manufacture of smokeless fuel until this was cheaper than soft bituminous coal, and forbidding the use of the latter in large cities, where it had been shown that three-fourths of the smoke arose from the domestic hearth. He did not agree with the suggestion that fresh space should be provided through the erection of higher buildings, because horizontal travelling with sufficient access was preferable to vertical travelling with restricted access.

Finally, he suggested the L.C.C. could possibly obtain statutory powers in one of their omnibus Bills to plan a greater London. It would take time, and the preliminary work might be done, as in America, by expert advisory committees, supported by the general interest and enthusiasm of the public.

ST. PAUL'S CATHEDRAL.

PROBLEMS OF REPAIR.

WE have received from Mr. A. Henthorn Stott the following letter :—

"Your interesting article in the current issue suggests the following :

"First.—Take down the dome and its supports.

"Second.—Impound the whole site with a reinforced concrete wall of sufficient depth, and oval on plan.

"Third.—Rebuild the dome with supports and foundations relatively equal to the surrounding work.

"Fourth.—Rebuild the aisle parapets with cavity walls, the inner being thick and the outer cut a shell."

Mr. Stott's suggestions would certainly meet some of the structural difficulties of the case, and his second proposal to "impound the whole site with a reinforced concrete wall of sufficient depth, and oval on plan" deserves to be taken into serious consideration.

Should the slight general sliding on the foundation be found, on investigation, to be continued, or threaten to become a menace to the stability of the building, this device would be admirable in that it would leave the Cathedral itself free from disturbance, provided that the work was designed for execution in suitable stages. The excavation to "sufficient depth" would need, of course, all the precautions proper to a work of underpinning if the existing shallow foundations were to be kept intact. The proposals to pull down and rebuild important parts of the Cathedral are by no means acceptable, however, and should not be entertained for a moment. All lovers of Sir Christopher Wren's work will wish to maintain the veritable structure he has left to us, and they would rightly insist that the upper parts of the building, as pointed out in our article, are just those portions in which the characteristic inventive genius of the great master is most vigorously expressed.

The inner and outer domes, the ingenious brick cone with its historical use of reinforcing metal, and the external stone lantern, are features which embody Wren's mental outlook upon constructive architecture, and must be retained in position at all costs. They are not themselves so seriously decayed as the lower parts of the building, and their repair is largely a matter of detailed treatment. Even if sentiment and historical interest were to be altogether laid on one side the cost of demolition and rebuilding would be enormous and unnecessary.

The problems of repairing the building as it stands are certainly difficult, and involved in mutually contradictory conditions, but they are not insuperable and can be solved by the application of scientific principles of construction.

An article upon the repair of Jedburgh Abbey published in our issues of December 14 and 21, 1923, shows that a comparatively small quantity of well chosen new material, if judiciously and inconspicuously applied, can develop and bring into play a great deal of the strength of an old building.

Masses of masonry which were lying inert, unused and even dangerous, were harnessed together by suitable tensile reinforcement in such a manner as would at least render them less dangerous, and had even in some parts transformed a point of weakness into a source of strength.

Design of such inconspicuous methods of repair is costly in preliminary investigation, and makes great demands upon the mental efforts and the courage of those who undertake the work, which is obviously of a special character, and can only be carried out successfully by craftsmen experienced in this branch of building construction.

But by means of such up-to-date methods of repair as were practised by H.M. Office of Works at Jedburgh Abbey the main bulk of the old structure is left undisturbed, and whereas several thousand tons of material would have to be handled, and lowered, and lifted in the processes of demolition and rebuilding the dome of St. Paul's and its supports, only a few hundred tons might be needed in repairing the building on modern lines.

In regard to the aisle walls, the suggestion to rebuild the aisle parapets as hollow walls with the heaviest side placed where it would be most useful in restraining the arch thrusts, the element of demolition is again to the fore. The suggestion is structurally sound, but ignores sentiment and history.

As suggested in our article, suitable reinforcement adequately protected in the heart of the existing parapets; and anchored back around and across the building, would meet the case with a minimum of alteration to the existing structure and also with a minimum of expense.

HOUSING COMMITTEE REPORT.

The Housing Committee of the London County Council is to submit shortly a report dealing with a representation made by the Medical Officer of Health of Poplar with reference to the number of small unhealthy areas in the borough.

The Committee has come to the following conclusion: The conditions existing in the greater part of the Baker's-alley, Birchfield-street, and Bromley-place areas are such that the evils can only be effectively remedied by means of an improvement scheme under the Housing Act of 1890, and that such a scheme ought to be undertaken forthwith. As regards the Baker's-alley area, they propose to deal in the first instance with only the worst part, which lies at the rear of houses in Bow-road, nearly opposite Bow Church, and to this they consider should be added a number of houses on the northern and eastern side of Walter's-court, which should be demolished. The area is roughly 1¼ acres in extent, and comprises about 51 houses, occupied by 416 persons in all. The Birchfield-street area, three-quarters-of-an-acre in extent, comprising 27 houses, with a population of 97 persons; the Bromley-place area is also about three-quarters-of-an-acre in extent, with 35 houses, which are at present occupied by 227 persons of the working classes. The cost of acquisition and clearance of the three areas is estimated at about £12,000, apart from the cost of erecting new dwellings to provide for the rehousing of those displaced.

Owing to the shortage of housing accommodation the question of rehousing was one which presented very great difficulty, and they had had under consideration proposals of the Education Committee with regard to a site known as the Back-alley site, which has been acquired or scheduled for acquisition for the erection of a school. Powers have now been obtained over property in Back-alley for the provision of this alternative accommodation, and the greater portion of the scheduled property has already been purchased.

HELLENISTIC ART IN ANCIENT AMERICA.

BY W. R. LETHABY.

IN the portico of the British Museum has, not long since, been erected a cast from a big square sculptured pier from Central America. It is described thus: "Guatemala, Pillar from the ancient Maya site of Quregua, A.D. 242." This great cast is part of the Maudslay collection of Maya sculptures from Central America, consisting of many remarkable originals as well as of casts. The originals have for a long time been exhibited on the landing of the N.E. staircase, but the casts have only recently been arranged in a special gallery, and an excellent guide to the collection giving an account of ancient American art has also been published.

Often I have thought of the strange Chinese look of many of these things and had decided for myself that ancient American art must in some way have been an offshoot of Asiatic art.

Again, about a month ago a lecture was given before the Chinese Society in London on the ancient sculpture of China, and the lecturer pointed out how curiously one of the earliest known examples resembled the antique American carvings. Even more recently there have been notices in the Press of an expedition of exploration to Easter Island, where large rude figure sculptures are known to exist (two are in the portico of the British Museum), and the problem of their origin seems to be part of a general question of the transmission of the arts across the seas which divide Asia from America.

A new book which I have found very interesting has now been sent to me for review, and, although I ought to be doing other things, I cannot help expressing the pleasure I have had in reading it. This is "Myths of Pre-Columbian America," by Mr. Donald A. Mackensie,* one of a series on Myth and Legend in Literature and Art, of which half a dozen volumes are by the same author. The meaning of myths is a very large and very cloudy subject-matter to attempt to explain, but the present volume seems to me restrained and suggestive. I cannot pretend to judge these scholarly matters outside the field of art, but I believe that almost any reader is likely to find the book generally convincing on its special thesis. The subject is not so much the interpretation of myths, as a comparison between ideas revealed in the culture of ancient America and that of Asia; leading to the conclusion that there are so many correspondences that there must have been some close relation between the arts of the two continents, although they were sundered by a wide sea.

"The question is faced whether these manifestations of ancient culture were of independent origin or had been imported from the Old World. The view has been favoured by some writers that America remained isolated until it was discovered by Columbus and that we should account for the existence there of habits of life, thought, &c., similar to those found elsewhere by accepting them as proofs of the psychic unity of mankind—as natural products of the human mind. Similar needs, we are informed, produce similar results. . . . Throughout this volume it is shown that there are ample data which point to fusions of myths and beliefs. Anthropologists who favour the idea that pre-Columbian American civilisations were of independent origin have to explain why the myths and practices of the New World assumed at the beginning those complex features which, in the Old World, resulted from the fusions and movements of many peoples of different racial types, after a lapse of time much greater than that covered by New World civilisation. . . . When questions like this are asked, it becomes difficult to reject the view that the sudden growth of civilisation in America resulted from the intrusion of minorities from centres of Old World culture. When, further, it is found that so many beliefs, &c., common to the Old World are found in the New, the contention seems sound that the onus of proof for their faith must be laid on those who favour the theory of independent origin."

* The Gresham Publishing Company, Ltd., 66, Chandos-street, Covent Garden. 12s. 6d.

The argument is wrought out in chapters entitled: The Glamour of Gold, The Elephant in American Art, Symbols with a History, The Winged Disc, American-Asiatic Relations, Ancient Pacific Mariners, Burial Customs, Tlaloc and the Dragon, Motives for Migration, &c.

The author is mainly concerned with beliefs and customs, and although there are some photographs of monuments there is little which deals with the artistic analogies between the monuments of America and Asia. Indeed, most of the plates seem hardly to be referred to in the text. In the index I do not find the words: Architecture, buildings, masonry, sculpture, decoration, orientation, inscriptions. If, however, the student of Art history will examine the collection at the British Museum for himself, while having the question of relation to Chinese

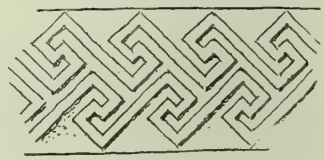

FIG. 1.

art in his mind, he will be likely to be convinced by the direct evidence. Taking only the cast in the portico, it must be admitted that the whole thing looks Chinese—the attitude, face, dress of the figure, the fretted ornamentation and square "scrolls," and even the regular chess-board disposition of the inscription characters; above all a Dragon's head terminating a sort of sceptre carried by the figure is so perfectly Chinese that it is difficult to think that it could have been carved by any other than an artist from the "Middle Kingdom" itself.

Examination of this monument and of the Maudslay collection as a whole will also suggest that behind the more immediate Chinese influence we may perceive Hellenistic sources, and to this further question I will now turn. Works of precision in masonry, figure sculpture, and architectural ornament were all so far as we know of Egyptian origin, and were passed on to Mesopotamia and Greece, and from those to China. The general facts of Hellenistic influence in India and China, have recently been clearly set out by scholars, and they have been

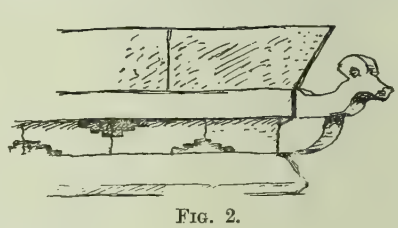

FIG. 2.

fortified by Sir Aurel Steins' explorations along the trade route.

Dr. Giles, in "China and the Chinese (1902)," has a long chapter comparing "China and Ancient Greece," which begins by drawing out general correspondences between the culture and customs of the two peoples, thus: "The water-clock has been known to the Chinese for centuries. Where did it come from? Is it a mere coincidence that the ancient Greeks used water-clocks? Is it a coincidence that the Greeks used an abacus or counting board? Is it a mere coincidence that the olive should be associated in China, as in Greece, with propitiation? A Chinaman who wishes to make up a quarrel will send a piece of red paper containing an olive, in token of friendly feeling. The extraordinary similarities between the Chinese and Pythagorean systems of music place it beyond a doubt that one must have derived from the other. There are also equally extraordinary similarities between the Chinese and Greek Calendars. In 104 B.C. the Chinese adopted a cycle of nineteen years, a period which was found to bring together the solar and the lunar years. But this is precisely the cycle said to have been introduced by Meton in the fifth century B.C., and adopted at Athens about 330 B.C. . . . . We know from Chinese history that, so far back as the second century B.C., Chinese generals succeeded in annexing such distant regions as Kokand and the Pamirs. About 138 B.C. a statesman was sent on a mission to Bactria. Now Bactria was then a Greek Kingdom which had been founded by Diodorus in 256 B.C.; and it would appear to have had commercial relations with China. Chang reported that he had seen Chinese merchandise there in the markets. Chang brought back the walnut and the grape, previously unknown in China. . . . About one hundred years B.C., a new kind of mirror comes into vogue, called by a new name. These new mirrors were discs of metal polished on one side and decorated on the other—a description which tallies with that of the ancient Greek mirror. Illustrations of them are given in the great Encyclopædia, and the fifth of these, second century B.C., is remarkable as being ornamented with the well known 'key,' or Greek pattern, so common in Chinese decoration. Afterwards we come to a mirror decorated with grapes and vine leaves Interspersed are animals, among others the lion, which is unknown in China. . . . Besides, there is a horse with wings. On comparing the latter, with Pegasus it is quite impossible to doubt that the Chinese is a copy of the Greek."

Much more is given by Dr. Giles which results in a convincing proof that in the late Hellenistic and Early-Christian epochs there must have been a very large penetration of Hellenistic culture in Eastern Asia. In the arts, the mirrors with Greek fret and vine decoration, the lion and winged horse are only examples. The roof of corrugated tiles, the arch, the lattice, were all probably borrowings from the West. The model of a high-class Chinese house in the British Museum, with its entrance doors, open court and central reception chamber is remarkably like a Greek house and a Roman villa.

In the volume before me I find other pronouncements to the same effect as those just quoted. Professor Tylor, the late distinguished Oxford authority on Ethnographical lore, after comparing some Mexican and Buddhist pictures, argued that "the appearance of analogies so close and complex of Buddhist ideas in Mexico, constituted a correspondence of so high an order as to preclude any explanation except direct transmission from one religion to another." Again, Dr. Laufer, an American scholar, has more recently said: "In opposition to the prevalent opinion, it cannot be emphasised enough that Chinese civilisation is not the exclusive production of the Chinese but an amalgamation of ideas accumulated from manifold quarters" (1912). Again, in "A Study in Chinese and Hellenistic Folklore" (1915), he points out that "certain fundamental religious ideas reached China from *Fu-lin* (Syria and Byzantium)." Still later, Professor Elliot Smith sees that America is "a rich storehouse of historical date . . . a museum of the cultural history of the Old World. . . . When venturesome sailors began to navigate the open seas and exploit Polynesia, for centuries there was more or less constant influx of customs and beliefs, which were drawn from Egypt and Babylonia, from the Mediterranean and East Africa, from India, China and Japan . . . From this jumble of confusion the local priesthood of Central America built up a system which is distinctively American, though most of the ingredients was borrowed from the Old World" ("The Evolution of the Dragon"). Compare also the work of Mr. W. J. Perry on the distribution of ancient megaliths.

When I selected my title I had no thought that any writer had suggested the possibility of any large transfusion of ideas from the classical world to America, and I am yet ignorant whether detailed parallels have been drawn in the field of art; but that the material exists for such comparison even the few photographic

plates in the volume before us demonstrate. I will comment on them in their order, numbering them according to the pages they face.

8. A long terrace, with massive façade wall of fine big, ashlar masonry, consisting of plinths, table courses and panels, the last containing adaptations of Greek fret and running-scroll patterns, also of an all-over lozenge diaper. The running-scroll pattern was a typical Hellenistic motive. The diagonal fret is probably the most popular of all Chinese patterns even to this day. It is found on Coptic stuffs of about the fifth century and reached Britain by the seventh. At this time it was probably known all round the world including America. (Fig. 1).

16. A stone building having coarsed rubble walls to the height of the door-lintel and wrought masonry above. The front is divided into storys by projecting table mouldings and ornamental bands, making-up what might properly be called entablatures. The "cornice" here and elsewhere is a plain but effective splay. (Fig. 2).

84. Sculptured figures in profile, very well drawn, with some classical grace showing through the hieratic treatment. (This is from "A Glimpse of Guatemala," by Maudslay, which is evidently a book to consult).

104. Photograph of another figure sculpture. A robe is covered with a continuous lozenge diaper of quite a civilised kind; it might appear unchanged on a Roman mosaic floor, a Romanesque wall-painting, or an Eastern carpet. (The original sculpture is in the British Museum). Compare Fig. 5 (*b*).

120. A megalithic gateway of wrought stone, with what looks like a sun symbol sculptured in the middle. A band of ornament is made up of a fret pattern with panels inserted at intervals—ingenious and quite civilised; the principle is found in Roman mosaics, but this is a playful variation and looks very Chinese. (Fig. 3.)

FIG. 3

160. Remarkable square temple on a tall stepped-pyramid, which was very like the diminishing terraces of the Chinese temple of heaven; the temple is divided into two storys by projecting courses with others above forming an upper cornice—in a way refined and classic.

292. A large monolithic "drum" surrounded by sculptured reliefs with top and bottom borders. At first the "Mexican" look of the pairs of fighting figures make it seem "barbaric," but it is a serious work of skilful art, and the way in which a series of circular shields link the several groups together is masterly. The borders are simple, orderly and civilised; in the top one are units which look as if they might be derivations from Ionic capitals and the bottom border is quite romantic and "Byzantine." (Fig. 4). It might be in Sta. Sophia.

FIG. 4.

312. This is a wonderfully fine piece of polygonal masonry beautifully wrought with rounded edges at the joints. Roughly polygonal masonry is a common thing in Japan, but the indented joints and fairness of this work have a Hellenistic look. As remarked in Daremberg & Saglio's great "Dictionary of Antiquities," it is a mistake to think of polygonal masonry in Greece as necessarily primitive—it persisted in city walls and such like till a late date.

I add a few sketches, made in the British Museum, of details which have a close resemblance to those of late Greek art.

Fig. 5 (*a*) shows a general type of doorway: that of the megalithic monument mentioned above, of which there is a small model in the Museum, is like this, and there are at least two

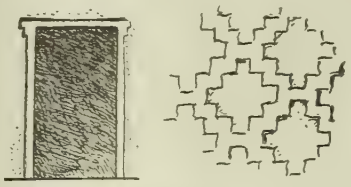

FIG. 5.

others shown in small wooden models; over one of the latter is a small window opening with a round head, which must be a derivative of a true arch. The recessed margins of the doorways is manifestly very like the classical shouldered architrave. Fig. 5 (*b*) is from a pottery vessel, a favourite form of all-over pattern. A similar pattern of large scale occurs on the terrace front described above. Fig. 6 (*a*) is a guilloche pattern from one of the plaster

FIG. 6.

casts; (*b*) is a wave-scroll from a pot; (*c*) is another; (*d*) from an original sculptured panel, appears to be a version of the same scroll which has been squared for weaving. On this panel and two others draperies have all-over patterns something like 5 (*b*), which is evidently well suited for textiles.

Fig. 7 is a carved roll moulding from the angles of the monument in the Museum portico, and this is strikingly Hellenistic. One of the plaster casts has a cable moulding, and doubtless

FIG. 7.

other classical likenesses could be found in the ornamental details.

Much of the sculpture is repulsively "savage," but examples can be picked out of a sweeter temper and high competence in workmanship. One little head of green jadite in the Ethnological Gallery is really beautiful, and so Chinese that it might almost be an importation. A second larger head in white stone (Maundslay Coll.) is also an able piece of work. In the cast gallery there is a panel in flat relief of a nude figure squatting on a throne which has grace and charm. The execution of some of the original panels at the Museum is exceptionally delicate, and yet masterly.

If our ordinary reasoning on artistic origins and affinities are generally true, then it may be asserted with confidence that the art of Central America was closely related to that of China, and like it had Hellenistic elements. If the Hellenistic elements are admitted, then I would suggest we have a further criterion for dating the ancient American monuments. By the chronology of the British Museum Guide (which, by the way, does not mention China nor Greece) the cast in the portico is dated about A.D. 240, but it is noted that, "Recently Professor Morley has worked out another correction . . . his dating is consistently 270 years later than that first suggested by Bowditch. Those who are convinced have merely to add 270 years to the dates as they appear on this Guide." On my line of approach I am drawn to the later dating, which would make A.D. 500 a central date in the art of ancient America, and thus allow more time for the expansion of late Hellenistic art in China (Buddhist?) and the passing of it on to America.

TOWN PLANNING.

DR. I. G. GIBBON, Assistant Secretary of the Ministry of Health, delivered a lecture on "Town Planning" at the London School of Economics recently. Sir Aston Webb, who presided, said it was a matter which should interest everyone. It was a great mistake that streets and cities were planned by nobody.

In the course of his remarks the lecturer said it was time that the architect, the engineer, and the surveyor took adequate measures to learn the business of town planning. In their English fashion of putting the cart before the horse they had done very little indeed in the way of such study. They were too complacent in this country, too content with makeshifts, but they paid very heavily indeed for their ways.

Dealing with the financial aspect of the subject, he said that the future of town planning depended on to what extent business men took hold of the problem. Economic production depended on the grouping of businesses. Generally that could only be obtained where there was intelligent town planning.

He considered the traffic problem could not be solved by traffic facilities. It could only be cured by reducing the traffic, and that could only be done by the proper location of places for various uses. It was a question whether they were not to-day pursuing a wasteful path by using their roads for so much heavy motor lorry traffic. The hindrance to the use of the railways was loading and unloading. If they had railways from works to warehouses and factories to docks, where loading and unloading unnecessarily was avoided, there would be enormous gain.

The time was ripe for the preparation of a plan for London. Improvements and developments ought to proceed on a plan after inquiry, and that applied to St. Paul's Bridge, Charing Cross Bridge, and Lambeth Bridge. At the moment it seemed it was no one's business. He would like to see for London the appointment of a general committee representing all the various interests. Under that committee should be a small executive, on which business should be strongly represented, to supervise and direct the work necessary for a plan. A great deal of money would not be required to begin with. Money would not be difficult if a few big business men were convinced of the vital urgency of the problem for the industrial and commercial well-being of London.

THE RENAISSANCE OF BIRMINGHAM.

Mr. Rupert Savage, F.R.I.B.A., recently gave his presidential address to the Birmingham Architectural Association. In the course of his address he said the term Renaissance was usually employed to describe the revival in scholarship and art which occurred during the fifteenth and sixteenth centuries, but he used it more particularly in reference to architecture.

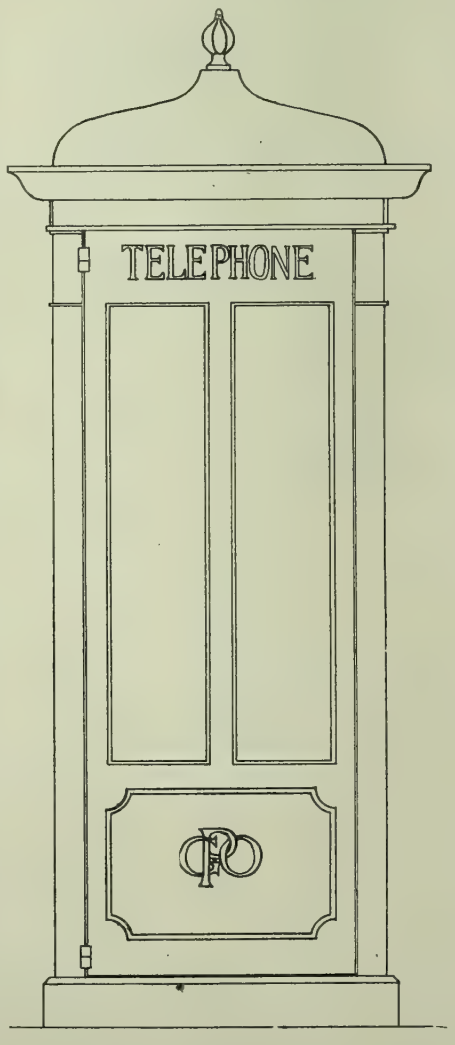
The Renaissance of Birmingham was a movement which had scarcely begun, but of which they saw some premonitory symptoms; for, when they compared the city with other great cities at home and abroad, they would come to the conclusion that the Renaissance was not only inevitable but was very much overdue.

There were few who would deny that Birmingham—the greatest city in England (excluding London)—presented an outward aspect unworthy of its commercial greatness. It claimed the title of the Capital of the Midlands, and was not only a great centre of commerce and industry but also of music, painting, the drama, and all the arts, architecture excepted. The present state of their city might be summarised as a huge agglomeration of human beings, crowded into a formless mass of mean streets and shabby buildings. It had never been planned—it had simply grown in a shapeless form, dictated by the apparent needs of the moment. Considering its size, Birmingham was singularly lacking in fine, main thoroughfares, and there were few streets having any pretensions to size and dignity. The main roads leading out of the town were ill-defined, narrow, and tortuous. There were few open spaces, and such as existed were irregular in plan and devoid of buildings of a monumental character.

The shopping area in the centre of the town was small and inadequate, while in the suburbs they found miles of miserable shops whose very existence seemed superfluous. Their public buildings were few and scattered, and whatever merit they possessed was discounted by an absence of logical grouping.

Whatever might be thought of this description of the city as it was to-day, there was at least sufficient truth in it to demonstrate the need for an early improvement. If the movement for the betterment of the town were to prosper and fructify, it was at first necessary to enlist the interest and sympathy of the whole body of citizens, and to awaken them to a consciousness of their present shortcomings, and to instil a spirit of civic patriotism. An aptitude for buying in the cheapest market and selling in the dearest might lead to an acquisition of wealth, but it certainly was not conducive to an appreciation of the higher aspects of life, and it was this commercial spirit which was to-day the great bar to all advancement in the purely cultural and æsthetic movements. Among the ranks of the City Council there were a number of capable and energetic workers in the cause of betterment, but their energies were directed to strictly utilitarian projects, and there were few indeed who had any lively conception of the great moral value of abstract beauty.

Destructive criticism was an easy task, but had limited value; it was necessary, then, to offer some concrete suggestions as to the direction the proposed movement should take and the means by which it might be accomplished. These suggestions must necessarily be limited to those which more closely concerned the Architectural profession, viz., the improvement in town planning and street architecture.



The first step to be taken, as previously stated, was to arouse the interest and enlist the support of the man in the street. The second step was to make a general survey of future developments. The third, and perhaps the most important, was to ascertain what could be commenced and accomplished during the present generation.

There already existed a number of agencies for arousing the interest of the public and promoting civic patriotism. Notable among them was the Civic Society, which existed for the purpose of assisting the movement now advocated, while the University was becoming increasingly active in proclaiming the cultural value of non-commercial subjects. The Municipal School of Art was inculcating an appreciation of æsthetic values over a wide area, and with its assistance their School of Architecture was doing valuable work in imparting a sound technical training to the rising generation of Birmingham architects, and last, but not least, was the Birmingham Architectural Association, which was endeavouring to improve the standard of current architecture and the status of the profession. It was to be hoped that the united efforts of those bodies, aided by a sympathetic attitude on the part of their civic rulers, might ultimately elicit some response from their rather unresponsive citizens.

When they came to survey the programme of future development, they quickly came up against the fact that they were dealing with a fully developed town. Some town-planning enthusiasts were apt to forget this and seemed to think that they were planning a new city on an open plain; for, in the centre of the town in particular, it was impossible to demolish whole streets and extinguish old-established interests.

The City Council had been engaged for some years on the task of town planning Birmingham, and much useful work had been done. While they recognised the effort that had been made, they, as architects, were inclined to feel that the work had been influenced solely by technical considerations and the æsthetic aspect had been insufficiently recognised.

In many towns the work had been placed in the hands of experienced architects, but it would appear that road-making, sewage, and traffic control were the sole considerations. In most European countries and America, where the architect was an important factor in all civic developments, they saw, as a result, a remarkable difference between their own towns and those they visited in their foreign travels.

G.P.O. Public Telephone Call Office.

In most Continental towns the railway station was a building of some architectural pretensions and was approached by a public square, and thus formed a dignified entrance to the town. The Prefecture, the Town Hall, and Art Galleries were fine buildings well displayed in open spaces. The large Opera House was a source of pride to the Municipality, who usually contributed to its upkeep.

In England, however, they did things differently. The railway stations were erected by private enterprise and the planning of their approach was a matter of hazard. Their theatres were run for private gain and received no support from the Municipality. The same tale of non-interference might be told of many of their semi-public buildings, largely due, no doubt, to the pronounced individualism so characteristic of their race.

What they might hope for in the future development of their city was a complete and comprehensive town plan of the city and its suburbs, with due regard to the architectural and artistic aspects of the subject, the reconstruction of their railway stations and the construction of new arterial roads. They also hoped to see the erection of a public hall adequate to the needs of the city, and a really fine exhibition hall to replace the obsolete Bingley Hall; their really fine Market Hall might be renovated, and their wholesale markets re-grouped on a coherent plan. The question of slum clearance and provision of new homes for workers was too big a subject for treatment there, but was a matter of urgent necessity. These were a few suggestions for a far-reaching scheme which might easily take a century to develop. What could they do now, or in the immediate future, as the contribution of their generation to the general scheme?

The most pressing need was for the completion and publication of town plans for inner Birmingham, for the present uncertainty as to street widening and frontage was a serious hindrance to freeholders and building owners alike. The planning of the new public square at the bottom of Broad-street might be proceeded with, and the rebuilding of the street itself on more generous lines might be encouraged. The scheme for a new thoroughfare across New-street Station was a project of the first magnitude, and it was to be hoped that it would be considered in relation to the remodelling of the station itself, which was at present not only an obstruction but an eyesore.

In the matter of housing, the City Council could materially aid the orderly development of new districts by inaugurating a building policy having some regard to lay-out and architectural composition; for the present type of house might be economically sound but it left much to be desired in the way of design.

The freeholders could help to improve the standard of building by relaxing their rigid attitude and by selling freely to those who wished to build. The present leasehold system was the worst cause of poor building in Birmingham.

The building owners could do much for the future of the city by taking a wider and more generous view of expenditure on building. The great manufacturing and trading companies in the city might assist the movement by building central offices worthy of their commercial importance.

The architects might help in the Renaissance of Birmingham by placing at the disposal of their clients sound advice and efficient professional service. There could be no question that the improvement in architectural education in recent years was already bearing fruit in a higher standard of work, a process which would become increasingly evident as the present generation grew up.

They all realised that the progress of improvement must be gradual and spontaneous. Let them hope, however, that the voice of their protests and aspirations might have some small influence in hastening the commencement of the Renaissance of Birmingham.

ARCHITECTS' AND SURVEYORS' ASSISTANTS' PROFESSIONAL UNION.

ANNUAL GENERAL MEETING OF THE METROPOLITAN BRANCH.

Mr. J. W. Dennington (Chairman), who is now President of the Union, presided at the annual general meeting of the Metropolitan Branch of the Architects' and Surveyors' Assistants' Professional Union, at Caxton Hall, Westminster, S.W. 1, on Thursday last week.

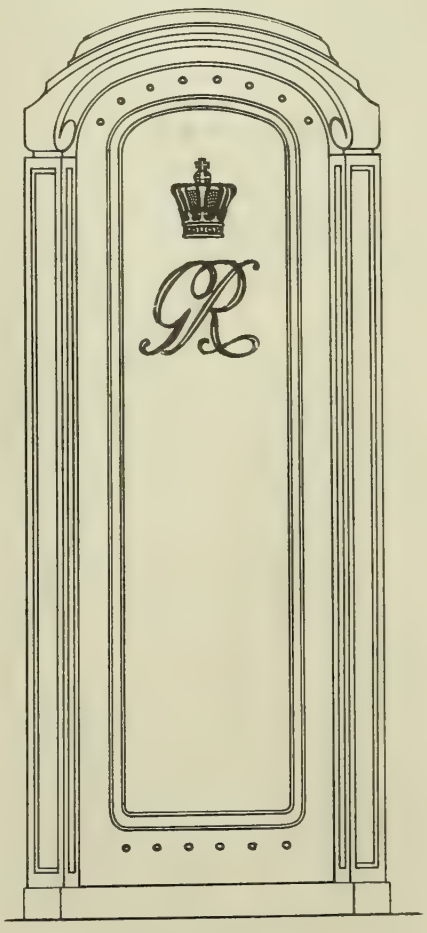
After the minutes of the last meeting had been approved and signed, Mr. J. A. Gould (Honorary Secretary) gave a report of the activities of the Branch during the past year. The Branch was, he said, always endeavouring to raise the status of its members, both collectively and individually. The Union was in a rather unique position. It was a body of workers in the architectural, surveying, and building professions; it was non-political; and it had never been subsidised by anyone. It was an entirely self-supporting body, and in consequence it was in a position to discuss matters from the assistants' point of view without anyone being able to tie its hands. The Union did nothing outrageous, nor asked for anything outrageous; but, nevertheless, it insisted on its rightful claims for the assistant. The Union worked for the benefit of the professions which its membership represented, and it had gained the respect of the learned societies throughout the country within the short period of four years during which it had been in existence. During its year of office, the retiring committee had worked enthusiastically and unceasingly in the interests of the members. The first thing it tackled was the question of unemployment, and it had taken steps which had resulted in the provision of employment for many of the members. The question of a benefit fund had also been taken up, and a scheme was prepared and submitted to the Executive Council of the Union. It was proposed to call the fund the "Benevolent Fund of the Architects' and Surveyors' Assistants' Professional Union." The objects of the fund would be to provide benefits for members of the Union who needed assistance, to care for the widows and orphans of deceased members, to make loans to the younger members to help them in following up their profession, to endow rest homes for the members, and otherwise. The scheme was received very favourably by the Executive Council, and several of the provincial branches had already stated that they were in favour of it. A proposal that the title of the Union should be altered, so that it might become known as a learned society, had also been considered, but they were all agreed that the Union should remain a union. Another point which had been brought to the notice of the Executive Council was the question of the payment of unemployed benefit to professional workers; it seemed very unfair that the professional worker should be denied the unemployment benefit received by the manual worker, and it was suggested that the matter be put before the National Federation of Non-Manual Workers. A scheme for obtaining trade discounts for members of the Union was also under discussion. The social side had not been overlooked, and a great many events had been arranged.

In conclusion, Mr. Gould said he wished to relinquish the Honorary Secretaryship in order to be able to give all his spare time to a scheme he had in hand for the provision of a hostel in London for the use of the members of the Union. The sort of thing he had in mind was a hostel, centrally situated, for the accommodation of members visiting or taking appointments in London, and also to be used for the offices of the Union, of the Metropolitan Branch, and for social purposes. It would comprise a hall, offices, bedrooms, bathrooms, a lounge, reference library, a professional bureau, restaurant, games rooms, and arrangements for outdoor sports. He had had several offers of help, financially and otherwise, from influential members of the professions concerned, and it was anticipated that the total cost would be covered by increasing the subscription of members by 10s. a year, because a great deal of expenditure now incurred for office accommodation and the hire of halls for meetings, lectures, and social events, would be saved, and the money received for the use of the hostel would be a continual source of revenue to the Union. The existing professional bodies had no facilities of the kind which would be provided by the proposed hostel, and it was anticipated that this added advantage accompanying membership of the Union would result in a considerable increase in membership.

The report and the Treasurer's report, which showed a satisfactory balance, were adopted.

The following officers were elected for the ensuing year:—

Chairman: Mr. L. E. Wheble.
Vice-Chairman: Mr. J. A. Hatfield.
Hon. Treasurer: Mr. R. G. Forbes, M.S.A.
Auditors: Messrs. Rattenbury & Wright.



Mr. Gould's intimation that he wished to retire from the Honorary Secretaryship was received with general regret, and on the unanimous request of the meeting he consented to serve until a successor was appointed.

The new Committee was appointed as follows: Messrs. J. G. Batley; A. F. Lodge; A. A. Beckham, P.A.S.I.; A. S. Reeves; F. C. Burton, M.S.A.; L. E. Wheble, A.R.S.I.; H. J. Mark, Lic.R.I.B.A.; C. R. Cathrow; J. A. Hatfield; N. H. Cooper; J. A. Gould; E. H. Worley; J. O. H. Hughes, M.S.A., M.I.S.E.; H. R. Sayer, F.S.I., A.R.I.B.A.; R. S. Forbes, M.S.A.; A. P. Knight; J. H. Metcalf; W. S. Dalton; H. Hyams, F.R.I.B.A.; and P. Manger, A.R.I.B.A.

After the formal business of the meeting, Mr. John Mitchell (General Secretary of the Union) made a short speech on the objects and aims of the Union. After an appreciation of the services of Mr. J. A. Gould, who was, he said, one of the most enthusiastic members of the Union, he reminded them that on March 4 this year the London Area would celebrate its fifth birthday. Since then wonderful progress had been made. The Union had brought to light the fact that there were assistants in the architectural and surveying professions working for salaries and under conditions which were a disgrace to those professions, and since its inception it had done much to improve the status and working conditions of its membership. A minimum salary had been set up, and none of the large number of situations which the Union had found for its members had been at less than the minimum rate. The Union was now in negotiation with the Royal Institute of British Architects on the question of the direct representation of the Union on the R.I.B.A. Council. The question of minimum salaries was also now under discussion between the two bodies, and a joint conference on the subject of overcrowding in the profession was being arranged. He felt that one of the chief causes of the present low salaries in the architectural and surveying professions was the large number of inefficient men. There were three methods of entry into the professions, namely, (1) from the schools, (2) pupilage, and (3) entering an office as a youth with no proper pupilage and picking up the profession at the office and at an evening school. The schools were more or less business concerns, and did not place any bounds on the number of assistants the profession could absorb; the pupilage system was one which allowed of grave abuses; and the other means of entering the profession was no system at all. A committee had been appointed by the Union to go into the whole question of education and overcrowding in both professions, and also as it affected technical assistants in the building industry. From a census which had been taken it was found that about 20 per cent. of the assistants in the two professions had not come from day courses at recognised schools nor had they had any definite pupilage—they simply entered an architect's or surveyor's office as office boys or typists and learned what they could. That resulted in a low standard of achievement, and the Union was putting forward proposals which would result in raising the general level of achievement. It was also proposed to look after the interest of technical assistants in the building industry, for they were often people who had left architects' offices and gone into a builder's office because of the better salary and conditions which the latter offered. The benevolent fund scheme was being taken up by the branches with great enthusiasm, as it was realised that such a scheme would be invaluable in widening the scope of the Union. A National Convention had been arranged to be held this year at Olympia during the Building Trades Exhibition. A series of lectures would be given by well-known men, and parties had already been formed in Devon, Southampton, Leicester, Northamptonshire, Birmingham, Scotland, and other places to attend. It was hoped to hold a dinner at Olympia after the Conference, and also to organise visits to the British Empire Exhibition and other places of interest to the members. He was much interested in the scheme for the provision of a hostel, and hoped the members would give it their hearty support.

In conclusion, he said it was very gratifying to see the way in which the membership of the Union had increased during the past year. Some of the branches, such as Manchester, had actually doubled their membership, and many had recorded increases of 50 per cent. and over; in London alone the membership increased by 103 last year, and it would certainly not be long before every assistant in the architectural and surveying professions was a member.

After some further discussion, the meeting terminated with a hearty vote of thanks to the Chairman for presiding.

THE ARCHITECTS' AND BUILDERS' INQUIRY BUREAU.

Band Re-Sawing Machine.

Sir,—I should be glad to have full particulars of this machine suitable for a builder, and in particular would like to know :—

1. Machine suitable for cutting deals, maximum cut say 18 in. deep. Is the machine suitable and economical for shallow cutting, say down to 2 in. ? What kind of foundation and depth below the floor is needed ?

2. What accessories are necessary in addition to the machine itself to keep it and saws in order ?

3. Approximate output and suitable equipment for handling timber—feeding and taking away, and space required.

4. Approximate cost of the whole outfit, and actual experience of the use of the machine.

5. Best makers. "Sawyer."

[Reply.]

"Sawyer."—(1) You can rip deals to the maximum depth of the machine on virtually any properly constructed band-saw. The maximum depth of any particular machine is determined by the height above the table to which the top guide can be lifted. The process will, however, be slow and inefficient unless you use a properly constructed "band re-saw" with pulleys of from 4 ft. to 5 ft. diameter, with blades of from 4 in. to 6 in. in width, and fitted with a powerful feed.

As a rule these high-speed re-saws are not adapted for flatting, as it is assumed that they will be used continually on deep cutting, and flatting can be done on a less powerful machine. At least two of the British makers, however, construct a high-speed re-saw with provision for flatting as well, with a horizontal roller feed and return motion specially for this purpose in addition to the vertical feed for deeping. Such machines are equally efficient for either purpose.

The best foundation is a plain concrete slab and deep excavation is unnecessary, as no part of the machine need be below the floor except the lower portion of the saw pulley and possibly a small portion of the driving pulley.

(2) You will require sharpening, setting, swaging and side-dressing appliances ; anvil, hammers and rolls for tensioning ; brazing and patching outfit, and certain appliances for facilitating the manipulation of these long blades.

(3) The output depends (a) on the make of the machine and (b) on the diameters of saw pulleys and the blades used.

The largest of these machines are sometimes speeded up to 200 lineal feet per minute. We have known a higher feed than this with a powerful machine when working on comparatively shallow material, say a 7 in. deal.

The actual space occupied by the machine should be approximately 9 or 10 ft. by 6 or 7 ft. That required for the feeding-in and taking-away appliances depends entirely on your conditions, with which we are unacquainted. For anything over 100 ft. per minute automatic gear for these purposes is certainly desirable.

(4) We cannot advise you on this point because the prices of different makers vary considerably, as also do the machines they recommend. Much depends also on the outputs you wish to attain. Here we can only say in the abstract that it is useless to go in for band re-sawing unless it is done very thoroughly. When this is done it has proved itself to be the most rapid and efficient of re-sawing methods. We would recommend you to obtain expert advice as to points 3 and 4, as a comparison between what you are doing and what you require to do, and your facilities for doing it, can only be ascertained by a knowledge of the actual conditions, and detailed advice cannot be given without this.

Damp on Ceilings.

Sir,—One can appreciate Mr. Matthews' surprise at finding the discoloration in only two of his rooms, and the fact that he lives in a district within the influence of the sea air might have accounted for this, as sea sand might have been used in part of the plaster work. But as he says that he lives where there has been no rain for several days, one must look for some other reason as a solution to his problem. He does not say what is the material covering his roof, but from my knowledge of the district I should believe it to be tiles. He is further perplexed by the fact that though the rooms, in which the discoloration showed, face in different directions, the effect was the same in both of them, yet not in any of the other rooms. The point is a good one, and one which, if the solution I have in mind be the correct one, can only be overcome in one way. I do not know the plan of the house, but I think it is possible that, though the rooms face at right angles, yet the roof covering these two rooms may be in one slope, and that of course facing in only one direction. If this is so my solution may prove to be the correct one.

Though there was no rain in the district it is highly probable there was snow. If this should prove to be the case, and as in most other parts of England this was accompanied by a gale from the east, a gale of such force that it blew the snow through door and window rebates, then it is quite possible that the snow, whilst in such a gale it would not be allowed to settle on the roof anywhere where it could be seen, yet it could and most likely would be blown underneath the laps of the tiles, and if there were no building paper under the tiles the snow would accumulate over the ceilings of any rooms under that slope of roof facing the gale, no matter how the rooms themselves faced. Probably the slope of the roof over these two rooms is all one, and that there is no waterproof building paper under the tiles, if tiles they be. J. C.

Sir,—Mr. Ernest Matthews' letter breathes so much the spirit of Mark Tapley, "coming out at his strongest" in adversity, that one feels one must do something for him.

The ceilings of his north and east rooms are perhaps under portions of the roof which are sheltered from the mid-day sun, while the remainder of his house probably gets its full share. After a cold spell of weather these ceilings therefore get thoroughly chilled and remain so for a time even after a change to milder and more humid weather. The air, saturated with water-vapour is quick to yield up its moisture in the form of condensation upon any cold surface into which it comes in contact, as the lowering in temperature renders it incapable of holding its full quota. Hence the damp ceilings. The walls, on the other hand, are kept warmer by the warm air of the house, and being nearer the temperature of the mild air there is therefore no condensation, or no more porous plaster can cope with by absorption.

Probably Mr. Matthews has noticed his perplexing phenomenon during some such weather conditions as indicated above, when condensation is inevitable unless specially guarded against.

Further, if his windows are opened daily the prevailing south-west winds will help to dry out the rooms that face south and west.

There may, of course, be other influences at work at which it would be impossible to guess without more information, but I think I have probably touched the key to the mystery.

If the trouble is very serious a little heat in the affected rooms is all that is required, such as a small ruby-glow oil lamp, unless it is felt that the adoption of central heating is not prohibitive, which is the sure cure for such worries as these. "Sympathiser."

Solid and Hollow Floors.

Sir,—I have followed with keen interest the correspondence in your columns on solid and hollow ground floors. My experience concerning the types of floors under discussion may be of interest. I have just finished a big housing scheme in which both types of floors were laid, and I would recommend most emphatically the use of hollow ground floors in preference to solid.

The question of cost is in favour of solid floors, but the cost is more than counterbalanced by the quicker method of constructing hollow floors. I have found that in most cases the tendency in solid floors is to dampness, even with a coating of tar and pitch over the breeze.

Southport. H. V. B. Thorington.

Sir,—Two of your correspondents who reply to this inquiry lean to the view that if both are properly constructed the advantage in cost is with the solid floor. Except in cases where the floor level is several feet above solid subsoil the hollow floor involves the entirely extra cost of the excavation, the brickwork in sleeper walls, floor joists and wall plates. The site concrete is equally necessary whether it serves as a foundation for the sleeper walls or directly to receive the floor boards or other surface finish. In King's Lynn, mostly built upon reclaimed ground, the subsoil is waterlogged at the depth of a few feet. Many of the roads are made up above the original ground level, and in the houses put up by some of the speculative builders the sleeper walls are built directly upon the earth surface and, despite local by-laws, the surface or "site" concrete has been entirely omitted. As a consequence, nearly every house so constructed requires within a few years the entire renewal of the timber portions of the ground floor construction. When the boards are taken up, it is not unusual to find a pool of water that has drained in from the higher soil banked against the outside walls. In such cases it would obviously be better to fill in the space under the floor and cover the site with a layer of impervious concrete upon which the material forming the floor surface is laid. The level of the subsoil water, or "water table" as it is sometimes called, fluctuates with rainfall, and when this ground water rises it forces out of the earth the noxious gases which are the product of decaying vegetable matter. The exclusion of these gases from the buildings we occupy is a very important function of site concrete, and because of this poor concrete does not safeguard the health of the occupants.

King's Lynn. L. E. W.

Trade Union.

Sir,—Would you kindly let me know what would be the correct or a suitable trade union for an assistant to clerk of works on a building job to belong to ? E. A. Youngash.

[Reply.]

An assistant clerk of works should possess the certificate of the Carpenters' Company for sanitary building construction. With this, other things being equal, he would be elected to Associate membership of the Incorporated Clerks of Works' Association.

Building Apprentices.

Sir,—We are considering taking apprentices for the bricklaying trade, but have no acquaintance with the procedure, nor with the form of agreement needed.

London. Garsubil, Ltd.

[Reply.]

The question of apprenticeships is left in the hands of the local bodies of the Federation of Building Trades' Employers of Great Britain and Ireland. We would, therefore, refer you to the London Master Builders' Association, 48, Bedford-square, London.

Building Costs.

Sir,—I should be glad if you could let me know which would work out cheaper, a four-story factory or the same amount of accommodation spread over one floor only. The premises would be required for a large printing works, and the question as to the cost of land does not come in, as the land is already available.

"Essex."

PRACTICAL DESIGN FOR BUILDING CONSTRUCTION—IV.

AN ELEMENTARY EXPLANATION OF THE APPLICATION OF THE THEORY OF CONSTRUCTION TO PRACTICAL DESIGN.

By EWART S. ANDREWS, B.Sc., M.I.Struct.E., A.M.Inst.C.E.

SECTION I. WALLS AND FOUNDATIONS.

(*Continued.*)

Examples of Foundation Calculations: (1) *For Steel Stanchion.*—As an example of a calculation of the simplest type, we will take the case of a concrete base required for a steel stanchion carrying a load of 100 tons upon a site where the soil pressure is not to exceed 1 ton per sq. ft.

In the first place, we have to find the necessary size of the base plate of the stanchion; this is determined by the allowable stress upon the concrete. The L.C.C. Steel Frame Act states that "the pressure on concrete foundations shall not exceed 12 tons per sq. ft." This limitation of the stress on the concrete may have been justified in the early days of concrete, and may be justified to-day if care is not taken that the concrete be properly proportioned—in other words, that only the material optimistically called "builders' concrete" will be used.

For well-graded Portland cement concrete of the 1 : 3 : 6 mix a conservative figure for the allowable compressive stress or pressure on the concrete is 18 tons per sq. ft., and for the 1 : 2 : 4 mix 25 tons per sq. ft. may safely be taken.

In our case we will assume a pressure of 18 tons per sq. ft.; we shall, therefore, require $\frac{100}{18} = 5.6$ sq. ft. approximately for the bearing area of the base plate; a base plate 2 ft. 6 in. square gives an area of 6.2 sq. ft., and will be regarded as satisfactory.

We next come to the calculation of the size of the concrete base; this depends upon the permissible pressure on the soil. In our case the resistance of the soil is poor, and must not exceed 1 ton per sq. ft. The spread will, therefore, have to be considerable, and the weight of the concrete block itself will be at least 20 per cent. of the load carried (*i.e.*, 20 tons in our case).

In making our calculation for the pressure in the soil we have to allow for the weight of the foundation itself in addition to the weight transmitted by the stanchion, so that we have to provide for a load of 100 + 20 = 120 tons.

Allowing for 1 ton per sq. ft., we shall require a base 120 sq. ft. in area—base 11 ft. sq., as shown in Fig. 6 will just do this.

Adopting the rule that the angle of dispersion for good concrete may be taken as 45 degrees, we see that the depth of the concrete must be equal to the projection of the concrete over the base plate—*i.e.*, 4 ft. 3 in.

This comes a deep base, and we must now check the weight of it. Taking the weight of concrete as 140 lbs. per cub. ft., we shall have—

Weight of base in tons—

$$= \frac{11 \times 11 \times 4.25 \times 140}{2240}$$

$$= 32 \text{ (roughly)}$$

Our total weight therefore is 100 + 32 = 132 tons, and to keep the soil pressure quite within the limit of one ton per square foot the footing would have to be extended to 11 ft. 6 in. square and the depth increased by a further 3 in.

This is a case in which a reinforced concrete base would be much more economical, the depth of the base could be reduced to 18 in. and the combined load and weight of base would then be so much reduced that the spread could be slightly reduced below 11 ft. square instead of having to be increased. In addition to the saving in the cost of the concrete—against which has to be placed the cost of the reinforcement; although this will be less than the saving in the concrete—we have the saving in the cost of the additional excavation.

Reinforced concrete bases are in general less costly than steel beam grillages and quite as efficient; we hope to be able to deal later in this series of articles with calculations for reinforced concrete.

(2) *Calculations of Pressure below Footing for Cavity Wall.*—We will now investigate the maximum pressure on the soil beneath a concrete footing for a cavity wall for a small house. In this case it was desirable to avoid if possible extending the footing beyond the line of the wall and the arrangement shown in Fig. 7 was proposed.

Considering a foot length of the wall and footing, the load W1 coming down the centre of the outer skin of the wall was 840 pounds, and

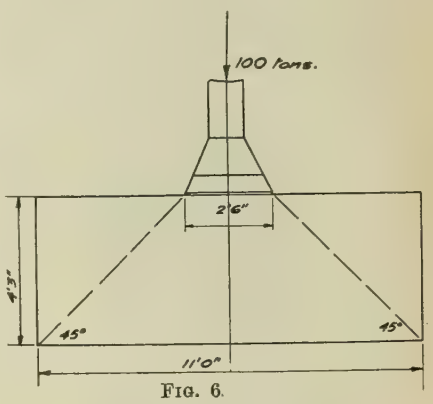

FIG. 6.

that W_2, coming down the inner skin, was 1,450 pounds.

The weight W of the concrete slab footing was 3 × 140 = 420 pounds.

Our first problem is to find the line of action of the resultant pressure P and the load point L.

We do this by the *Principle of Moments*, which states "that the moment about any point of the resultant of a number of forces is equal to the sum of the moments of the separate forces about the same point."

We choose the point X as a suitable point about which to take moments and proceed as follows:—

Total pressure P = 840 + 1450 + 420
= 2710 lbs.

Moments about X.

W_1 = 840 × 2.25 = 1890
W_2 = 1450 × 8.75 = 12690
W_3 = 420 × 18 = 7560

Sum of Moments 22140 pound inches.

Now the moment about X of the pressure P.

= P × LX = 2710 × LX

∴ 2710 × LX = 22140

i.e. $LX = \frac{22140}{2710}$

= 8.16 inches.

This is a case in which the pressure is eccentric but outside the "middle third," so that the distribution of pressure is given by a triangle as indicated in Fig. 5.

The base of this triangle will be equal to 3 times PX = 24.5 inches, or 2.04 feet.

To find the maximum intensity of pressure, we multiply the total pressure by 2 and divide by the base of the pressure triangle.

This gives:—

Maximum pressure on soil—

$$= \frac{2 \times 2710}{2.04}$$

= 2650 pounds per square foot.

This is more than could be allowed on the particular site namely, one ton per square foot.

Very little advantage would be obtained by extending the footing further inwards because although this would increase the moment of the forces about the point X and tend to move the point L further away from the point X, it would increase at the same time the total pressure. As it is, the footing has already been extended inwards to an extent which is probably greater than economy would justify. If, for instance, we reduced the concrete to 2 ft. wide the soil pressure would only come very slightly in excess of that previously obtained. The only practical course to follow is to extend the footing slightly beyond the edge of the outer skin of the wall; this will increase considerably the base of the pressure triangle and thus reduce the maximum pressure, since the area of the pressure triangle, which represents the resultant pressure on the soil, will remain the same in the two cases.

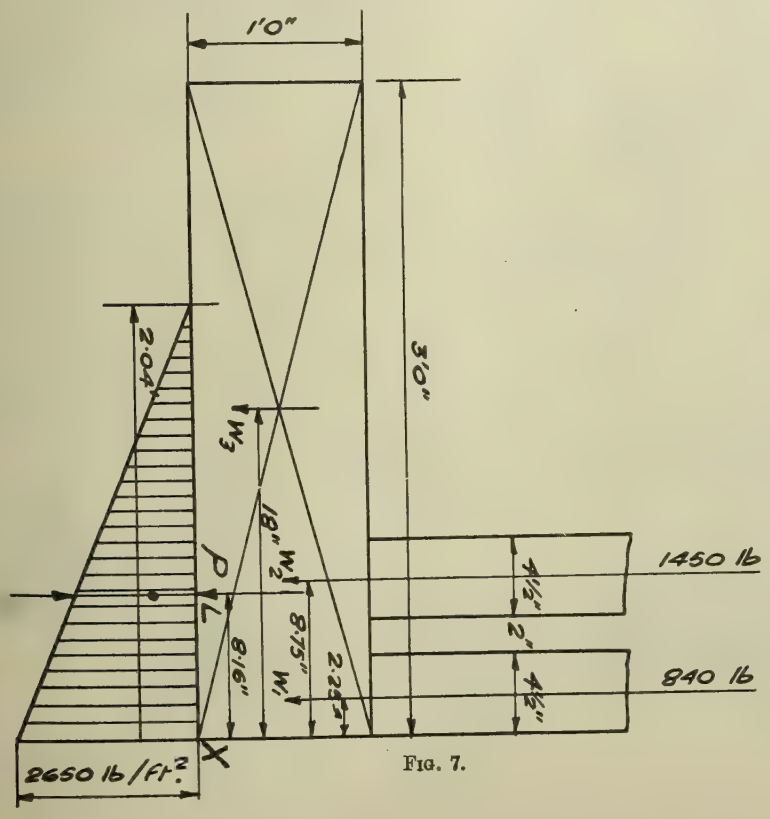

FIG. 7.

THE BUILDING TRADE.

THE COST OF BUILDING.

By T. P. BENNETT, F.R.I.B.A., Hon. F.I.O.B.

Comment was made in a former article upon the variation in the value of p.c. items disclosed by *The Builder* competition. In some cases these differences may be accounted for by variations in design or quality, as in the case of kitchen ranges. In others the possibility of variation is much less marked and in the design of baths and closet pans, there would seem to be ample data for the production of standard patterns of specified quality which would be obtainable at the low price which mass production brings. It is evident that standardisation in connection with house building may be applied broadly in two ways :—

(a) In connection with the design.

(b) In connection with certain mechanical and other fittings which involve little or no design.

All architects and most other people condemn standardisation which comes under the first heading. The imagination is rightly appalled at the contemplation of any possibility of a return to the rows of " brick boxes with slate lids " of thirty or forty years ago. It is true that standard steel sashes have been produced which have been used very widely without any suggestion of sameness of design and certainly with large saving in cost. It will probably be accepted that this employment of standardised units has reduced the cost of building without any great detriment to design and only slight damage to the temper of the architect. Upon the other hand, the standard sash has not affected the manufacture of special steel sashes of a great variety of shapes and patterns which are automatically used in better-class work and work where the cost may legitimately give way to an element of distinction.

The standardisation of the steel sash has had its counterpart in a parochial way in the standardisation of wood sashes for use in individual housing schemes where a designer has voluntarily provided himself with sashes which he designates " A," " B " and " C," and has used these sashes in many variations in design.

There are many other units of building which might be standardised with great advantage, the principal being :—R.W. gutters ; R.W. pipes ; W.W.P.s ; Baths ; Lavatory basins ; Water-closet basins ; Manholes ; Water and gas pipes ;

None of these items involves the question of sameness or monotony because even with the enormous variations in detail which at present exists, the general aspect of one R.W. gutter is very similar to that of another, and even baths have no very great individuality.

To standardise and lower the cost of these items, several things are necessary :—

1. A sound, reasonable specification.
2. A sound, but economical, design.
3. General acceptance of the standard.
4. The use of the standard article must be as wide and complete as possible.

By referring to the list of articles given above, it will be seen that these four points are quite within the reach of a very ordinary article and that there would be no apparent difference whatever in the appearance of the fittings used in a cottage of the kind most urgently needed to-day, whether the articles were standardised or not. While, however, the result is the same in each case, the effect upon the manufacturer is vastly different. At present every manufacturer tries to be different from his neighbour, so that his articles, and his alone, shall be used. He probably makes several kinds of baths and w.c. pans at a similar price so that he can offer his patrons a selection, and by this means has to manufacture and maintain a number of patterns and to carry a large stock and is prevented from launching out into an attempt at low production costs by working on a large scale because there is no certainty of a large demand for any one specified article. The Engineering Standards Committee state that recent makers' lists of manhole covers indicate the manufacture of 38 different sizes and 84 weights. The variations in baths, W.W.Ps. and other items must be almost as great.

If, therefore, the Ministry of Health, the local authorities, the railway companies, the architectural profession, and other interested bodies were to create a standard specification for all articles in common use and invariably specify the standard article for suitable work the demand for a few recognised articles would in a short time, reduce the cost substantially and at the same time increase the quality. One maker stated that if he were assured of a demand for a standard article of the kind referred to he could produce it 20 per cent. below the price and 30 per cent. above the quality of any similar article in the market to-day. With the use of several types, kitchen ranges could be standardised in a similar manner without reducing the choice of the prospective occupier of the house below that now available.

It is common knowledge that the production of low-priced commodities in every walk of life has only been possible because of the introduction of a system of mass production in the factories, and one of the means which has yet to be fully employed for providing low-priced houses is the use of mass production for many of the parts of the structure.

The Ministry of Health must, perhaps, be the pivot upon which the movement must revolve, but co-operation is required from professional bodies, manufacturers and merchants, and large users such as the Local Councils. The Engineering Standards Committee are investigating the standardisation of gutters and have already formulated the basis upon which standardisation could proceed for the other articles mentioned. Their efforts, however, will fail in the important matter of cheapness of production if the standard is insufficiently rigid and if architects and others, who are primarily responsible for the use of the article, do not universally adopt the standard arrived at.

When goods have no mark our Trade Mark laws provide for nothing to distinguish British made from foreign, but if they have any mark at all they must be stamped with the name of their country of origin. If, therefore, " British Standard " or " B.S.S." is universally stamped upon fittings, foreign copies will be known and many patriotic users will insist upon the supply of British fittings which have been made in Britain. In Canada and America there is a standard tube for gas, water or steam, and if this standard were forcibly adopted here it would automatically force some English makers to open up their overseas trade.

In preparing this article much assistance has been received from the articles of the Engineering Standards Committee, and from Mr. Percy G. Donald, whose wide experience and knowledge in the matter give weight to the energy and enthusiasm with which he has advocated its adoption. A paraphrase of his words summarises the most important aspects :

(1) Standardisation of fittings does not interfere with the man who can afford to pay for an article of special character or with matters of design where cost is a secondary consideration.

(2) A standardised article is a security inasmuch as it has been designed by experts to secure its soundness of type, weight, efficiency and low cost of manufacture.

(3) It gives the best possible article for the lowest possible cost.

COMPARISON OF PRICES OF BUILDING MATERIALS, &c.

We publish a table giving the prices of the principal building materials on February 1, as compared with the price for January 1, 1924.

Material.	Jan. 1, 1924. £ s. d.	Feb. 1, 1924. £ s. d.	Fall. %	Rise. %

BUILDING THROUGHOUT THE AGES.

A course of lectures on "The Romance of Building Throughout the Ages," delivered by Mr. George W. Thompson to the junior members of the Amalgamated Society of Woodworkers, during last session, at Liverpool, aroused a considerable amount of interest in the building industry in that city. The lectures were accompanied by lantern slides, the number of slides employed being about 350, and sheets of descriptive notes and sketches served to provide the members of the course with a permanent record of the content and sequence of the lectures.

FIG. 1.

The first of the series dealt with the Prehistoric and Egyptian (fiftieth century to first century, B.C.) period, and from this lecture and the sketches which accompanied it we take the following :—

The Tree of Architecture showed that the art of building had been influenced at all times by (*a*) geography, (*b*) geology, (*c*) climate, (*d*) religion, and (*e*) history.

Prehistoric man imitated nests of birds and lairs of beasts. He built nooks formed of twigs and covered with mud, then huts of branches covered with turf. Later, hunters and fisherfolk dwelt in caves. Those living a settled life constructed crude huts. Tribes living a pastoral or nomadic life learned to use tents. Associated with this early art were monoliths, dolmens, cromlechs, beehive huts, and lake dwellings.

Egyptian architecture belonged to a period when civilisation had reached a comparatively high state. The stages of evolution between prehistoric and Egyptian were lost in the mists of antiquity. Sphinx, pyramid, palace, temple and tomb with their hieroglyphics (picture stories) had survived through three to six thousand years, and revealed the story of war and peace, love and hate, and work and play

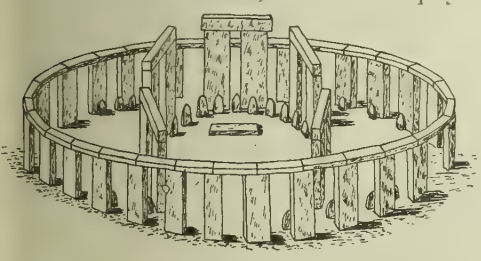

FIG. 2.

that slowly arose in the region through which flows the sacred Nile: "Flowing through Egypt like some grave, mighty thought."

Of the pyramids, erected from 3998 to 3721 B.C., Cheop's great pyramid rose 480 ft., covered 13 acres, and, it was thought, took 100,000 slaves 30 years to build. The despotism that massed men like ants had happily passed away, and to-day the power of 1,000 men might be found in a single machine. Pyramids might have possessed astronomical value. It was known they were used as tombs by the Pharaohs, who looked upon a dwelling-house as a temporary lodging, the tomb being the permanent abode. The architects and artificers of those wonderful structures were all forgotten, but their works would stand for ever as the most colossal art wonders of the world.

In the museums were Egyptian exhibits

consisting of mummies, sarcophagi, sculpture, amulets, dolls, musical instruments, games, jewellery, seals, weapons, tools, toilet utensils, and pottery, and it should be observed that Nature suggested ideas for ornamentation, *e.g.*, ibis, vulture, scarab, lotus, papyrus, palm and feathers.

The accompanying illustrations are from the sheets of sketches shown at the lecture.

FIG. 7.

FIG. 8.

Figs. 1 to 4 are examples of prehistoric architecture.

Fig. 1 is a monolith, or menhir, one of which, at Carnac, Brittany, is 63 ft. high and weighs 260 tons.

Fig. 2 is a reconstruction of Stonehenge, in Wiltshire. The history of this group is unknown, and among the different theories as to its origin are that it is the burial place of Boadicea, and that it was a druid temple. It is also uncertain as to who built it, some authorities attributing it to the Romans, and others to the Danes. The diameter of the circle is 333 ft., and two of the uprights are over 22 ft. in height. It is most generally considered that Stonehenge dates from 1680 B.C. Constructions such as this are known as cromlechs.

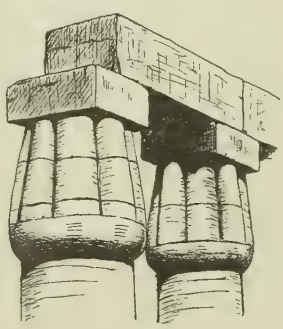

FIG. 9.

FIG. 10.

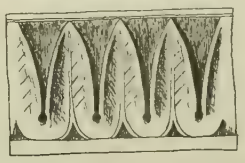

FIG. 11.

Fig. 3 shows a beehive hut in the Isle of Lewis, and is the type of building which formed the dwellings of the Early Britons.

Fig. 4, a tent, was used by shepherds and those leading a pastoral life, these were formed of branches and bark of trees obtained probably from the birch tree.

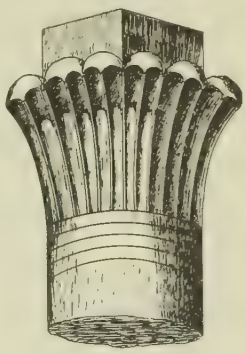

FIG. 12.

Some examples of Egyptian ornament and structures are depicted in Figs. 5 to 13.

The pyramids, which were erected over the tombs of Egyptian kings, are shown in Fig. 5.

Fig. 6 shows the Great Sphinx, which is in the form of a monolith with an animal's body and a human head. It is 142 ft. long and 65 ft. high.

Fig. 7 is the type of pylon situated at the entrance to Egyptian temples.

An obelisk is depicted in Fig. 8. An obelisk may be seen in London (Cleopatra's Needle), and there is a similar structure in Central Park, New York.

Fig. 9 is a capital of an Egyptian column based on the lotus bud.

A column capital based on the lotus flower is shown in Fig. 10, and a laurel leaf ornament in Fig. 11.

FIG. 13.

Fig. 12 illustrates a column capital based on the palm leaf.

Fig. 13 is a vulture with outspread wings, a symbol of protection.

The Egyptians employed as ornament natural objects such as the lotus plant, the symbol of fertility and abundance produced by the Nile when in flood, the palm and the papyrus. These are instructive as well as decorative, and much of Egyptian history may be learned from them.

Westminster Bank.

The annual ordinary general meeting of the shareholders of the Westminster Bank was held at the head office on January 24. Mr. Walter Leaf (the chairman) presided. The chairman, after a review of general conditions during the year under review, as revealed by import and export figures, observed that though the effect of a revival of trade had shown itself rather tardily, yet the evidence of the last quarter of the year was fairly unanimous in speaking of better conditions and hopeful prospects. Commenting upon the political situation, he said it was piquant and interesting; but for the business man not wholly unsatisfactory. Business wanted to be left alone; they had had enough of Government interference during the war, and had no desire to be made the subjects of rash experiments in economics, whether they took the form of deliberate inflation, protection, or capital levy. The Report was unanimously adopted.

BUILDING TIMBERS.

On January 22, Mr. Alexander Howard lectured on this subject at the School of Building, Brixton. Mr. H. D. Searles-Wood, F.R.I.B.A., presided.

The lecturer said perhaps the most ancient use of timber was for building houses. This use was so old that, strictly speaking, it was unnecessary to speak of building timber, since the very word timber implied building. In Sanskrit, Greek, Latin, Gothic, and their own English the words timber and building came from the same root, and timber was originally simply material to be used for building purposes. In the past men built of timber the lake dwellings of which traces existed in England, in Switzerland, New Guinea, Cochin China and America. It was said that the South American Republic of Venezuela owed its name to the fact that the Spaniards on their arrival in a new world found on a lagoon a kind of village entirely built on wooden piles, which they called Venezuela, which meant a little wooden Venice.

Without for one moment forgetting the great national importance of supporting the best schemes for conservation and afforestation, so as to increase the Empire's timber resources, he wished to explain to those who were less informed, that at present, at least, there were ample supplies available for building timbers without any material changes. He believed there existed in the minds of many architects, engineers, and others, a general impression that the scope from which supplies could be obtained must be widely broadened. When they heard of developments from India, Burma, Borneo, Philippines, Malay, &c., they had not yet realised that there was no prospect whatever of any fresh supplies of softwoods for building to be obtained from these sources. A great new supply of hardwoods had already been opened up, and those who were clever enough, and who did not allow themselves to be influenced by trade interests and other arguments, and would accept without prejudice the new timber solely upon its merits, would find a great field open.

The lecturer then made a few comments on the following extracts from specifications which he had recently received:

1. "The whole of the timber deals and battens, &c., to be perfectly sound and well-seasoned, of the best quality obtainable and of approved brands, free from all sap, shakes, large, loose, or dead knots, and other defects, and sawn die square."

If timber of this description were really supplied the cost would be much too great, and would be moreover quite unnecessary. The architect probably received fourth quality, or, indeed, it might even have been fifth quality; but in none of the qualities would it have been free from sap-wood or other defects.

2. "The oak to be of the best approved description, of good figure, carefully selected, free from all imperfections, and to have been felled for at least three years."

They would notice particularly the last clause; as a rule the architect got absolutely fresh-cut timber from freshly cut trees, not carefully selected.

This specification should read: "Reasonably free from injurious defects. The scantlings to be cut from freshly-felled timber, and thoroughly seasoned after cutting before use in the building."

The practice of continually asking for a quality or for a timber which could not be obtained, and consequently was not supplied, had the effect of making the conditions named useless, and so they were entirely ignored. How much better would it be to describe correctly what was required in a reasonable manner, and have it adhered to; this was what the American did.

Spruce.—The lecturer then spoke of the actual timbers which were employed in building construction, of which the most important were the soft woods—that was, the pines and the firs. The lowest in order used was spruce, or white, brought from Canada, America, Norway, Sweden and Southern Europe. Strangely enough, the use of spruce was common, and allowed by experts in Liverpool and on the north-west coast and in Scotland, but not allowed in London or the East Coast of England, and the South of England generally. Spruce was undoubtedly the least durable and the weakest wood commonly made use of for timbering.

Yellow.—The timber which was most used was what was known as Yellow, or Red, or Yellow Deal; or, in larger timbering sizes, Fir. It was, however, a pine which was commonly known by the name of Scots Pine. It was brought from Sweden, Russia, and, to a small extent, from Norway. It was impossible to over-rate the importance of getting this timber into the building in good, bright, dry condition. If this were accomplished, and the woodwork was well ventilated, it was difficult to say how long it would last.

Pitch Pine.—This timber came from the Southern States of North America. There was a great variety of quality, ranging from very bad to very high class. The best was a very fine building timber, while the lower qualities produced a bad timber.

Oregon Pine.—Another timber, known as Oregon Pine (which name, however, it was now desired should be abandoned in favour of the name Columbian Pine—Oregon being in America, and this wood coming from a British Dominion), also known as Douglas Fir, had come very prominently before the building world of late years. The trees grew to an immense height and girth, and, consequently, provided very long and large sizes, and on this account alone occupied a very important position in their list. The wood was also unusually free from large knots and other defects.

Larch.—Larch was a very reliable timber, quite insufficiently appreciated, and especially durable. The supply had always been small and intermittent, and it was probably on this account that it was little used or appreciated.

The lecturer then considered some of those hardwoods which were used for constructional work. Unfortunately, the list was too long to enable them to do more than touch the fringe of the subject. Among those which it had been possible to obtain in the past, that which had been most used was, of course, oak. He would probably give rather a shock to many when he said that under modern conditions he had come to the conclusion that oak was not a good wood to use now for constructional work.

First, for what reason had it been used? The answer was, for its greater strength and durability. One could hear the owner proudly boasting that his roof was constructed entirely of solid oak. But what did they find? In transverse strength it was little better than Scot's Pine; while its undoubtedly greater tensile strength was not required in such works of construction. Regarding the durability of oak, they might ask, where did they find Scot's Pine eaten up by the death watch beetle, as they were told the Westminster Hall roof timbers were eaten? They must not forget that he was speaking of modern conditions. Perhaps, 600 years ago the architect was more practical than he was to-day; perhaps, only more fortunate. It was certain that his roof was open tiled and the wind blew through it. That, he thought, was the reason why the Westminster Hall roof lasted so long, and the attack of the beetle had been the result of stopping practically all ventilation during some minor repairs some time ago.

Pyinkado.—This timber came from Burma where it was known as Ironwood. Its weight —60–90 lb.—made it difficult to transport, because it would not float. These difficulties, however, had been largely overcome, and the timber was now obtainable, in large sizes and good lengths, in immense quantity at a very moderate cost. It was one of the most durable, if not *the* most durable wood in the world. When comparatively fresh it could be sawn and worked easily with tools, but it became so hard with age that it turned the edges of all tools.

African Oak.—This was a dense, very hard, and very durable timber. Unfortunately, the supplies were very scarce, and the timber which was now often called African oak was not of the right species. In the late eighteenth century and the beginning of the nineteenth it was very highly thought of. Amongst the works in which it was used was Nelson's battleship the *Foudroyant*, which was captured from the French; the staircase and other constructional work in the old Post Office at St. Martin's le Grand, and in some old wooden cranes on the Thames bank dating back to Nelson's time.

Greenheart.—This wood came from British and Dutch Guiana. It had a strong, firm, hard grain. For some purposes he thought Pyinkado or African oak would take precedence of this wood; of course, they were all exceptionally strong timbers. Greenheart also took first place as a teredo-resisting wood, though jarrah probably ran it close.

Jarrah.—This wonderful Western Australian timber ranked very high as a strong and most durable timber for piers, bridge work, wharf and piling fronts, staging, and all other works of construction where strength, hardness, and durability were required.

Blue Gum.—This timber came from Australia and Tasmania. It had also been planted in India, Africa, and South America, in which countries it grew amazingly quickly. It was very strong and hard and exceedingly durable under many varying conditions.

Wana.—This timber had, as yet, only been received from Dutch Guiana, though as the forest trees were very much of the same species he expected they could get this from British Guiana also. It was very strong and, he believed, exceedingly durable.

Teak.—There was probably hardly any wood so well known and appreciated as teak, which in many respects occupied a unique place in the timber world. It was very durable, and for many purposes, notably for decks and ship-building generally, and for out-of-door work, its value exceeded that of any other.

It must be noted that he was not speaking of timbers which, although they might be said in some respects to be used in a constructional manner, were also required for decorative work, for window frames and joinery, for instance. For this dual use teak easily came first.

Cypress.—This was the Louisianan cypress, which greatly excelled in durability. It was a coniferous wood, and consequently some might classify it with the softwoods. In density and hardness it was perhaps midway between a hardwood and a softwood. In practical usage, however, for building purposes, it could only be considered a hardwood, for while it was not so strong as the other hardwoods, it possessed with a fair amount of strength a most remarkable durability.

British Oak.—So long as no sapwood was included and the woodwork was thoroughly ventilated this would be found a fairly good constructional hardwood. In his opinion, however, there were to-day many better hardwoods obtainable which, considering the high cost of construction and the comparative cost of material, put oak into rather a back place, especially since there appeared to be such an epidemic of the death watch beetle.

Karri.—This very fine Western Australian wood was exceptionally strong and, under some conditions, very durable. It must be used with care, however, and it had its limitations.

Sweet Chestnut.—This was a wonderfully durable timber with quite fair strength for constructional work. It was, however, rather difficult to get regular and sufficient supplies of sound timber, the prevailing fault being that the trees developed very bad splits.

Gurjun.—This splendid timber from India, besides being strong and durable, was obtainable in very long lengths and in very large sizes free from defect. It had been found to be stronger than British Oak, and when used in shell-filling factories during the war, was considered by experts to be the hardest and best timber which had been submitted for this use. Very large quantities had been absorbed for heavy constructional work of all kinds during the last three years.

In conclusion, the lecturer said the subject was full of interest and attraction, and the more they studied it the greater would be found the field for observation, and if he had stimulated their interest to even only a small degree, he was well repaid.

THE HOUSING ACTS: RECOVERY OF EXPENSES

We may note a further case, Adams *v.* Tuer (*Weekly Notes*, October 27), which turns on the provisions of the Housing Acts, where the local authority consider a house unfit for human habitation, and after notice to and default by the owner, do the work themselves. The Auckland Rural District Council, acting under section 28 of the Housing Town-Planning Act, 1919, on September 11, 1920, had served notices on the owner of certain houses in the district requiring her within twenty-eight days to execute certain specified work to render the houses fit for human habitation, and the notice not having been complied with, the Council, through a firm of builders, did the work themselves, and subsequently served a demand upon the owner for the sum of £342 0s. 9½d. in respect of the repairs executed and, payment not being made, proceedings were taken against the owner under section 28 subsection (3) to recover the same.

In the proceedings before the court of summary jurisdiction it was contended that the sum had not been properly incurred under section 28. It was said the amount charged for labour was excessive, that all the work charged for had not been done, and that work was done which was not necessary to render the house reasonably fit for human habitation. Evidence was given before the justices, and they found as facts that the amount charged for labour was excessive, that all the work charged for was not done, and that the Council did not incur the full sum of £342 0s. 9½d. in making the houses in all respects fit for human habitation, and that part of the work was unnecessary for that purpose, and they fixed the amount at £250 10s.

The Council, on appeal to a Divisional Court, contended that the magistrates were compelled to make an order for the payment of the full sum, and had no power to decide whether the work was, in fact, necessary, the owner's only remedy being by way of appeal to the Minister of Health under section 15 subsection (6) of the Housing Town-Planning Act, 1909.

It has to be borne in mind that in *ex parte* Rush (1922 2 K.B. 28; *The Builder*, July 21, 1922) it was held that the appeal to the Minister of Health contained in section 15 of the Act of 1909 was incorporated in section 28 of the Act of 1919, and that, after that decision, the Minister of Health gave notice that pending the amendment of the Housing Acts, all notices served by a Council under section 28 of the Act of 1919, requiring the execution of works and any demand for the payment of expenses, should contain a note that an owner has an appeal to the Minister of Health.

The Divisional Court held that the right to recover expenses under section 28 was a right to recover only such expenses as were incurred under and in pursuance of the section, that is, the expenses of work necessary to make the houses reasonably fit for human habitation, and the justices had not misdirected themselves in point of law, and the Council's appeal must be dismissed.

We dealt with this question in a note on the case Ryall *v.* Hart (*The Builder*, May 18, 1923) where, under section 28, the same point was raised, but in connection with the reasonableness of the time allowed by the notice in which the work had to be performed, and the Court held that, although under section 15 subsection (6) of the Housing Act, 1909, the owner could appeal to the Minister of Health against a notice requiring the work to be done, or against a demand for expenses incurred in doing the work, that subsection did not make the decision of the Minister final, or prescribe that, if an owner did not appeal to the Minister, the claim for expenses could not afterwards be questioned.

This legislation has caused considerable difficulty, for it will be remembered that in Ryall *v.* Cubitt Heath (1922 1 K.B. 275; *The Builder*, February 24, 1922) a different point was raised. There the proceedings were also being taken under section 28 of the Housing Act, 1919, and the work having been done by the local authority, proceedings were taken under subsection (3) to recover them. The defence was that the time specified in the notice was not reasonable, and this was upheld by the magistrate, but on appeal it was contended that the magistrate had no power to consider this question, and he should have made the order for the expenses, and then there was an appeal to Quarter Sessions under section 35 of the Housing Act of 1890, but a Divisional Court held that that section did not apply, as a "notice" under section 28 of the Act of 1919 was not the same as an "order" under section 35.

Sections 14 and 15 of the Housing Act, 1909, had to be read as one with section 28 of the Housing Act, 1919, and, as we showed in the case of Arlidge *v.* Tottenham Urban District Council (1922 2 K.B. 719; *The Builder*, February 28, 1923) and *ex parte* Rush (1922, 2 K.B. 28; *The Builder*, July 21, 1922) the Courts have experienced difficulty in thus interpreting them. Section 14 and 15 of the Act of 1909 apply to contracts of letting, for habitation of a house or part of a house, and the word "landlord" is used in those sections, and there is a limit of rental value. Section 28 of the Act of 1919 applies to "any house suitable for occupation by the working classes" and the word owner is used. In Arlidge's case it was pointed out that, reading the two Acts together, there was risk of overlapping, but since the earlier decisions we have referred to the Housing Act has been passed, and it may be useful to again consider how that Act affects the points raised in the former cases. When the Bill was before Parliament we drew attention to this question in an article in our issue for April 27, 1923.

The new Act is dated July 31, 1923, and section 10 relates to sections 14 and 15 of the Housing Act, 1909. Subsection (1) provides "Sections 14 and 15 of the Housing Town-Planning, &c., Act, 1909, shall have effect as respects letting for habitation after the passing of this Act as though (*a*) paragraph (*b*) of the said section 14 had been omitted, and (*b*), in paragraph (*c*) of the said section 14 for the word "Sixteen" there had been substituted the word "twenty-six." These amendments make section 14 read: "In any contract made after the passing of this Act for letting for habitation a house or part of a house at a rent not exceeding (*a*) in the case of a house situate in the administrative County of London £40 (*c*) in the case of a house situate elsewhere £26, there shall be implied a condition that the house is at the commencement of the holding in all respects reasonably fit for human habitation, but the condition aforesaid shall not be implied when a house or part of a house is let for a term of not less than three years upon the terms that it be put by the lessee into a condition reasonably fit for occupation, and the lease is not determinable at the option of either party before the expiration of that term."

Section 15 of the Act of 1909 contains the provisions for enforcing the observance of section 14. Subsection (1) provides that the last foregoing section shall take effect as if the condition implied by that section included an undertaking that the house shall, during the holding, be kept by the landlord in all respects reasonably fit for human habitation. Subsection (2) empowers the landlord or the local authority under certain conditions to enter the house for the purpose of viewing the state and condition of the house. Subsections (3) to (5) apply the general machinery for requiring the work to be done which is necessary to render the house reasonably fit for habitation and in default enabling the local authority to do the work and claim the expenses, and subsection (6) contains the right to appeal to the Minister of Health.

The whole of these subsections (3) to (6) are repealed by section 10 subsection (2) of the Housing Act, 1923. This subsection provides "Subsections (3) to (6) of section 15 of the Housing, &c., Act, 1909 (being provisions which are virtually superseded by section 28 of the Housing, &c., Act, 1919), are hereby repealed and the said section 28 shall have effect subject to the following modifications:—

Then it provides that (*a*) a notice given by a local authority under that section shall specify what works are to be deemed necessary, and in addition to serving the notice on the owner the local authority may serve copies on any persons "having an estate or interest in the premises superior to that of the owner."

Paragraph (*b*) gives the appeal to the Minister in much the same terms as subsection 15 of the Act of 1909, except that the time within which the appeal can be made can be lengthened by the Minister and there is a new proviso which is very important, viz., "Provided that no appeal against such a demand or order shall lie" (that is the demand or order in respect of expenses incurred) "if and so far as the appeal raises any question which might have been raised on an appeal against the notice itself, and subject to such appeal the notice demand or order shall be binding and conclusive as to any matters which could be raised on such appeal." This paragraph clears away the doubt which existed and which was the subject of decision in *Ex parte* Rush and Ryall *v.* Hart that there is an appeal to the Minister under section 28 of the Act of 1919, for it gives this appeal, but the proviso may raise a question whether that appeal is not to be the only means of obtaining redress, thus overruling the decisions in Ryall *v.* Hart and Adams *v.* Tuer that a remedy remains in the Courts although that appeal to the Minister has not been resorted to.

We imagine that the intention of the proviso was not to alter the law as laid down in those decisions, but simply to provide that every question which could be raised before the Minister on appeal as to the "notice," as for instance the reasonableness of the time allowed, should be raised then and not subsequently on the demand or order for expenses incurred, but the discretion given to the Minister as to the time in the notice, and the wording of the proviso "no appeal shall lie" and "subject to such appeal the notice demand or order shall be binding and conclusive as to any matters which could be raised on such appeal" will seem to make it arguable that the appeal to the Minister is now the only remedy.

It may be noticed that in section 15 of the Act of 1909 the word "landlord" is used whereas in this new subsection conferring an appeal the word "owner" is inserted. All the Acts have to be read as one, and no doubt the word "owner" will include the "landlord," but this is a piece of legislation by reference giving practitioners unnecessary trouble. In the decision in Arlidge's case the Court attached a good deal of significance to the distinction between "landlord" and "owner" in the two Acts of 1909 and 1919 in connection with the interpretation of the sections.

In several of the cases we have referred to the Judges have commented severely on the confused nature of this legislation relating to Housing, and in Arlidge's case Mr. Justice Lush was reported as saying that probably no Acts were more difficult to interpret except perhaps the Rent Restriction Acts, and from the points we have considered above it will be seen the new Housing Act has certainly not smoothed away difficulties but may even have increased them by throwing doubt again on some points which had been cleared up by the decisions delivered in the Courts.

Town Planning.

The Minister of Health will shortly issue a supplement to the Model Clauses published for use in the preparation of Town-Planning Schemes. Provisions are included for enabling the regulation of streets in a town-planning area to be dealt with wholly in a scheme, instead of partially in a scheme and partially in by-laws, thus, it is hoped, avoiding a dual system of control and introducing a desirable simplification. To be obtained direct from H.M.S.O., Kingsway.

MODERN BUILDERS' MACHINERY.

By STAFFORD RANSOME.

No. IV. ELECTRICAL AND STEAM POWER.—Part I.

Before considering the wood-converting tools themselves it is necessary to clear the ground by dealing with the subject of driving them. This question has so direct and vital a bearing on the eventual working policy that, unless the relative virtues of the various prime movers are grasped at the outset the purchaser may easily make a big blunder in equipping himself and in arranging his factory. The advent, and particularly the rapid developments of the electrical drive during recent years have greatly widened the field of wood conversion, both by making it possible to work existing machines under conditions and in localities where they could not be driven by any other form of power and by permitting the designing and production of certain tools of a portable or other special character which but for electricity could not be worked at all.

For the medium and small builder the choice is virtually narrowed down to a question between steam and electricity. Gas power, which was popular even a few years ago, has receded with the advance of the electrical drive. If it is a question of procuring one's gas from a town supply it is usually far more expensive, for a given result, than electrical current from a similar source, and if the purchaser is to make his own gas by means of a suction or other producing plant he has to face, not only the first cost of that plant, but its fuel, upkeep, and maintenance. Then again, driving by gas power, however the gas may be produced, does not simplify the lay-out of the machines or reduce the intermediate transmissions any more than does the steam drive, and in this respect electricity has a great advantage over both.

Gas, Wind, and Water.

Comparing gas with steam, the former plant has the advantage of occupying less space and costing somewhat less for labour. Steam, on the other hand, is far more elastic as a power distributor, and thereby is better suited in some respects to the peculiar requirements of wood-converting tools where the load, *i.e.*, the power demanded by the machines, varies constantly and abruptly and very considerably. Steam has the further advantage over other forms of power in a wood-working shop of being able to use as a fuel the whole of the wood refuse made by the machines. For, although gas may be produced from wood, and there are sawmills which are driven by gas produced from that material, it is not as a rule found to be as convenient as steam for small mills, and it is beaten in price for both large and small mills by electricity.

Water power is, of course, worth consideration when available under suitable conditions and in sufficient volume, but this is so seldom the case that we need not deal with it here. Curiously enough, wind, which to the modern saw-miller appears preposterous as a motive power for his machinery, is still very largely used for primitive sawmills in Holland and elsewhere. But, although builders' mills are sometimes run on primitive lines, the one thing a builder must not risk is being held up in his work. Consequently he cannot rely upon the conditions of the weather for driving his machines. Thus we may rule out water and wind, and, in ordinary circumstances, we must regard gas as an occasional substitute for steam. The choice therefore lies usually between the electrical motor on the one hand, and the engine, whether steam or gas, on the other. For the large builder, or for anyone who possesses a large sawmill, this question does not arise, as the advantages of driving most, if not all, of his machines by electricity are unquestionable. Even if he is fully equipped with a steam drive, it is usually a sound policy to use that power for the generation of electrical current, and to distribute the power through motors to the individual machines or groups of machines.

In the first place he will be able to dispense with most, if not all, of his network of shafting, gearing, and belting, saving thereby the first cost, the power used in driving them, the inconvenience, and the running expenses in connection with upkeep, besides lubricants and lubricators. This point is made abundantly clear by the alternative schemes which will be shown in Part II of this article. The second great advantage to him is that he may readjust his entire lay-out of the machines so that the work can be carried on to the best advantage. He is untrammelled as to the positions of his machines as he no longer has to locate them to suit his line shafting. By such a readjustment he can often effect a very substantial and permanent saving in his working expenses and an immense saving in space. This is a point too often lost sight of by users who go on working year after year in a shop which, as time goes on, gets progressively congested. The result is that accidents increase, stoppages are more frequent, the labour bill is far in excess of what it need be, and the output far below what it should be.

Abolition of the Belt.

There is another very important factor which tells in favour of the electrical drive, and that is, that in doing away with belts, the quality of the work will be greatly improved. It seems like heresy to say that a belt drive is an abomination in a world which has been built up on the products of belt-driven machines in every imaginable industry. And yet, speaking theoretically, it is so, for the action of the belt is continually to tug at one end of the spindle, tending all the time to strain it and wear the bearings unequally, and, when forced beyond certain well-defined limits, either as to its speed or load, to lose its transmitting efficiency very rapidly. The belt owes its position as the most popular form of driving agent to the fact that until the direct-coupled motor came into being as a commercial proposition, it was infinitely preferable to any other known method, at all events for transmitting high speeds. Thus we may take it that as a general principle it is always policy, where practicable, to run a machine by means of a motor coupled direct to its spindle or to each of its spindles rather than by a belt or a series of belts.

From the above it would seem that with all these advantages it would be hardly necessary to consider seriously the question of adopting any but the electrical drive. There is, however, another side to the question, and it is one which affects very materially the smaller builder who is studying the relative merits of electricity and steam or gas for his own purposes.

The Merits of Steam.

In favour of the steam engine we have in the first instance the powerful factor that it had been firmly established for well over a century before the advent of electricity as a practical means of driving machinery as the staple and for a long time the only prime mover, with the exception of water and wind. The user all the world over knows what steam power is and how to apply it, what it involves, and, in a general way, what it will do. He also knows how to keep it in repair.

The limitations which its use imposes on the arrangement of the machines, inconvenient as they may be, are known and accepted by long practice, and factories have always been designed to meet the case by generations of engineers. Then again, steam power is self-contained, *i.e.*, it is not dependent on any outside assistance except for its fuel supply, which can be brought to it, and, as explained, when used for driving wood-working plant, is partially or entirely supplied with fuel automatically on the spot in the form of wood refuse from the machines. The steam boiler, too, is omnivorous in its tastes. It can be constructed to consume coal, coke, peat, straw, wood, oil, or any other combustible material that may be to hand, and, by automatically disposing of the wood refuse, it obviates that trouble and expense in getting rid of it which is incurred with other forms of power.

The unique quality of the steam engine, however, is its elasticity, already referred to. This permits of its being forced by overloading to a far greater extent than any other power. This is a valuable feature where wood-working machines are concerned, because of the great and sudden changes in the load which are characteristic of the sawmill. This virtue of elasticity, however, cuts both ways, and may become a vice, as it often encourages thoughtless and haphazard users to overtax their engines by running constantly with an overload. This is neither scientific nor sound practice, as will be shown later, but we cannot get away from the fact that the builder in times of rush has often found the elasticity of the steam engine a very great convenience.

Summarised briefly, we may put this point as follows:—With an electrical drive you *must* put a sufficiency of power behind your machines or you cannot get them to work at all. With steam power you may knock along inefficiently with considerably less power than you ought properly to provide.

The Individual Drive.

Leaving the question of steam for the moment, we have, if we decide to adopt an electrical drive, two methods to choose from, viz., the "individual" and the "group" drives. The former is theoretically the ideal method, for, if carried out to its logical extreme, each spindle of every machine would have coupled to it its own independent motor, and thereby all shafting and other transmissions would be abolished. Further, it permits you to arrange your machines in your factory in any positions which may suit you with no more restriction than in arranging the furniture in a room. Another advantage in this drive is that when a machine is stopped, all power connected with it stops automatically too, as there are no shafting and belting to go on revolving and absorbing power to no purpose until it is time to start the machine again. Every ounce of power, too, which is given off by the motor is devoted to the spindle it is driving and to nothing else.

There are, however, two flies in the ointment in connection with the individual drive. The first is, that it is essential that each spindle must have a motor which is capable of driving it when working at its full capacity. With some builders' tools, particularly the saws, the difference between average requirements and full capacity may be very great. For instance, an ordinary circular saw of 36 in. diameter may well require 20 h.p. when cutting hard wood to its full depth at its highest speed, while during nine-tenths of the time it may be employed on flatting shallow stuff requiring perhaps 3 or 4 h.p.

The other weak point about the individual drive is that the speeds of the spindles of some builders' machines do not lend themselves to direct coupling to a motor. Thus the crank shaft of a log frame runs too slow and the planing spindle too fast for the generality of currents and motors for driving that are available in this country. When it is found impossible to synchronise the speeds of spindles with those of the motors, the difficulty is overcome by driving the spindle from a motor-driven countershaft by means of a belt, or else by reduction or accelerating gearing, as the case may be. Both these methods, however, absorb a considerable amount of the power before it is transmitted to the machine. In such a case we still have the individual drive, but it is not a direct drive, and its efficiency is not greater than that of the group drive. Thus, as a rule, all the spindles of a four-side planing machine are driven by the one countershaft to which a single motor is coupled.

There is a growing tendency, however, with panel and other planers which have only one spindle, to use a direct coupled motor. This is

done by reducing the speed of the planing spindle so that it will synchronise with that of the motor. Roughly speaking, the normal speeds of planing machines range from 3,000 to 4,000 revolutions per minute. These speeds are higher than are desirable for a direct current motor, because when driven beyond a certain speed there is apt to be trouble with it on account of centrifugal influence and balancing difficulties. On the other hand, in the case of an alternating current, the speed of the motor depends on the nature of the current, and it is seldom found with the currents that are usually available that the motors can be conveniently speeded to more than between 2,000 and 2,700 revolutions. If, therefore, we desire a direct drive on a planing machine we must reduce the speed of the planing spindle to that extent. Then, by using three or four cutters instead of two on the block, a very fair rate of feed may be obtained with an excellent quality of work, as a spindle running at 2,000 revs. with four cutters will produce work of an equal quality at the same rate of feed as a spindle running at 4,000 revs. with only two cutters. In fact, the work of the former should actually be better as the lower speed lessens the vibration and the spindle runs more steadily.

Another method of overcoming the difficulty is to speed up the motor by using a transformer, which will so modify the nature of the current as to permit of the motor attaining the higher speed. This last, however, introduces an element which, as a rule, it is well to avoid, at all events in factories which are dependent on outside help if anything goes wrong with the electrical portion of the plant. With a steam plant, if any hitch occurs, the small user knows what to do and how to do it. When he puts down an electrical drive, however, he generally considers that he has fulfilled his part of the bargain when he has paid for the motor and the current. He wishes to confine himself merely to "pushing the button and seeing the wheels go round" as far as his motive power is concerned. It is the simplicity of the electrical drive which has appealed to him.

OBITUARY.

Mr. W. H. Turner, J.P., of "Min-yr-Avon," Taff-embankment, Cardiff, a director of Messrs. E. Turner & Sons, building contractors, Cardiff, died recently after a brief illness. Mr. Turner was probably best known as one of the partners in the firm of contractors who erected the Cardiff City Hall and many other local buildings. Included amongst these were the Law Courts, the University College, the County Hall, the General Post Office, the Central Library, the Capitol Cinema, the Empire, the Medical College, and numerous churches and chapels.

The death took place recently of Mr. John Hall, of Wolverhampton, a well-known builder and contractor, at the age of 71 years.

Mr. Charles Llewelyn, a very prominent North Wales builder and contractor, passed away recently at the age of 39 years.

Alderman Arthur H. Constance, builders' merchant, of Worcester, passed away recently at Thorneloe, at the age of 53 years.

Messrs. Lewis's, Ltd., New Premises.

In our issue for Jan. 11 our correspondent inadvertently gave the wrong general contractors for this work. The general contractors for the work shown in our illustration are, of course, the well-known Liverpool firm of contractors, Messrs. E. Burns & Sons.

National Federation of Building Trades Employers.

In consequence of the railway strike it has been decided to postpone the annual dinner of the Federation from January 29 until February 19, at the Hotel Victoria, at 7.15 p.m.

The tender of Mr. P. Rourke, of Lutterworth, for the Church Langton Educational Institute, Leicester, should read £4,790, and not £4,970.

RATES OF WAGES IN THE BUILDING TRADE.

The following are the rates of wages in the building trade in England and Wales. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur :—

	Masons.	Bricklayers.	C'p'ters Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Labourers.
Aberdare	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Accrington	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½

(For rates of wages in the Building Trade in Scotland, see page 202).

CONTRACTS, COMPETITIONS, &c.

For some contracts still open, but not included in this List, see previous issues. Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, &c., may be obtained.

BUILDING AND PAINTING.

✱FEBRUARY 1.—**Romford, Essex.**—NURSES' HOME, &c.—Erection of nurses' home, erection of new wards, 2 blocks, erection of extension to laundry, erection of Medical Officer's residence, to be carried out at the Romford Union, for the Guardians. Messrs. Harrington & Evans, Guardians' Architects, 45, Bedford-row, London, W.C. 1. Deposit £5 5s.

FEBRUARY 2.—**Glyn Neath (Glam).**—HOUSES.—For erection at Maesmarchog Site, Glyn Neath, for the Neath R.D.C., 16 type "B," parlour, houses, in semi-detached blocks of two, in brickwork. Lump sum tender, for labour and materials complete, required. Mr. D. M. Davies, Architect, Council Offices, Orchard-street, Neath. Deposit £2 2s.

FEBRUARY 4.—**Aberkenfig (Glam).**—ERECTION OF HOUSES, &c.—For carrying out the following works for the Aberkenfig Building Club: Contract 1, Erecting 30 houses, parlour type, in pairs, complete with boundary walls and drains. Contract 2, Short extension of road, with surface water drainage, &c., planting of trees. Mr. Frank H. Heaven, architect, 39, Coronation-street, Aberkenfig. Deposit, Contract 1, £3 3s.; Contract 2, £2 2s.

FEBRUARY 4.—**Aldershot.**—REPAIRS.—For repair work at 78, Ash-road, for the T.C. Borough Sanitary Inspector, Municipal Buildings, Aldershot.

FEBRUARY 4.—**Barnsley.**—HOUSES.—For the erection of 10 houses, Blenheim-road, Barnsley. Mr. W. J. Deighton, "Park View," Park-road, Barnsley.

FEBRUARY 4.—**Bradford.**—HOUSES.—Erection of 10 houses on Swain House Estate, for the T.C. City Architect, Town Hall, Bradford.

FEBRUARY 4.—**Brentford.**—COTTAGE AND COACH-HOUSE.—Erection of a caretaker's cottage and coach-house at the Isolation Hospital, Clayponds-lane, Brentford, for the Brentford Urban District Council. Mr. W. J. W. Westlake, F.S.I., Engineer and Surveyor to the Council, Clifden House, Brentford.

FEBRUARY 4.—**Bristol.**—EXTENSION.—For extending and altering the offices at Queen-square, Bristol, of the Docks Committee. Messrs. W. S. Skinner & Sons, Architects, 27, Orchard-street, Bristol. Deposit £3 3s.

FEBRUARY 4.—**Chippenham.**—HOUSES.—For the erection of 20 houses, for the T.C. Mr. A. E. Adams, Borough Surveyor, Chippenham. Deposit £1 1s.

Builder's Estate.

Mr. Henry Herbert Ellis, of Moorfield-road, Pendleton, Lancs, builders' merchant, Salford, left £20,201, with net personalty £20,163.

PROPOSED NEW BUILDINGS & OTHER WORKS.*

IN these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works at the time of publication have been actually commenced. Abbreviations:—T.C. for Town Council; U.D.C. for Urban District Council; R.D.C for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; L.C.C. for London County Council: B.C. for Borough Council; and P.C. for Parish Council.

ABERDEEN.—Plans passed by T.C.: House, Bon-Accord-street, for Mr. Robert M. Ross, per Mr. G. Bennett Mitchell, architect; bungalow, Anderson-drive, for Mr. John Milne, wholesale merchant, per Mr. George Watt, architect; bungalow, Hilton-street, for Mr. Hugh M'Kay, grocer, per Messrs. Williamson & Bell, architects; alterations at Union Works, Guild street, for Pirie, Appleton & Co., Ltd., per Messrs. Jenkins & Marr, architects; reconstruction of roof at No. 41, Regent-quay, for Messrs. George Garrod & Sons, coopers, per Mr. George Watt, architect; alterations at the Royal Infirmary (Surgical Block), for the Directors, per Messrs. Kelly & Nicol, architects; six houses, Broomhill-road, for the Broomhill Home Building Syndicate, per Messrs. M'Andrew & Sutherland, architects; extension of premises, Berryden-road, for the Northern Co-operative Society, Ltd., per Messrs. Wilson & Walker, architects; hall and priest's house, Water-lane, for the Trustees of St. Clement's Episcopal Church, per Messrs. Kelly & Nicol, architects; two houses, Hammerfield avenue, for Mr. William Murray, builder; bungalow, Hilton-street, for Mr. Thomas T. Dobbie, manager, per Mr. William E. Gauld, architect; two houses, Ashley-road and north side of Ashley-gardens, for Mr. John Rodger, commercial traveller, and Mr. James Philip, manager, per Messrs. D. & J. R. M'Millan, architects; bungalow, Deemount-road, for Mr. William Thomson, retired teacher, per Messrs. D. & J. R. M'Millan, architects; three houses, Froghall-terrace, for Mr. Alexander Leask, carpenter, per Mr. George Watt, architect: two bungalows, Gray street, for Mr. Alexander Ritchie, fruiterer, and Mr. Alexander Forrest, ship steward, per Messrs. Sutherland & George, architects; bungalow, Deemount road, for Mr. James Moir, Culduthil, Inverness, per Messrs. D. & J. R. M'Millan, architects; two houses, Ashley-gardens, for Messrs. D. & J. R. M'Millan, architects; two houses, Brighton-place, for Messrs. D. & J. R. M'Millan, architects; bungalow, Broomhill-road, for Mr. John M. Frost, spirit merchant, per Mr. William E. Gauld, architect.

ABRAM.—Plans of a house in Leigh-road, for Mr. F. Bowdell, have been passed by the U.D.C.

ACCRINGTON.—A shelter for children attending Spring Hill Council School is under consideration.

ADLINGTON.—To consider the question of a war memorial for the district, a public meeting was held in the Congregational Church School. After discussion it was resolved to request the D.C. to proceed with the acquisition of the Grove Field as a recreation ground and playing field to serve the purpose of a war memorial, the estimated cost, £1,500, to be raised by public subscription or by other voluntary efforts.

AMPTHILL.—Plan passed by U.D.C.: House, Chandos-road, for Mr. G. Botsford.

ANNFIELD PLAIN.—The U.D.C. have received intimation that the South Derwent Colliery Company, Ltd., contemplates building 80 houses at West Kyo, near the Council's housing site.

BEDFORD.—Plans passed by T.C.: Mr. E. H. C. Inskip, for Miss D. Dugmore, bungalow, London-road; Mr. G. P. Allen, for the Governors of the Harpur-Trust, lavatories, "East Lodge," Cardington-road; Mr. I. Daughtry, for Mr. F. Redman, alterations 62, St. Loyes-street.

BELFAST.—Plans passed: Four villas, off Irwin-avenue, for Mr. James H. Barton; villa in Marlborough Park, for Miss A. Matier (architect, Mr. J. Hosie); clubhouse, near Downview-avenue, for the Council of the Fortwilliam Golf Club (architect, Mr. J. C. Stevenson); lecture hall, on Donegall-road, for the committee of the Sandy-row Methodist Church (architect, Mr. F. D. Brown); villa, in Blodon-drive, for Mr. T. R. Malcolmson (architect, Mr. James Hunter); stores, in Ravensdale-street, for Mr. George McCall (architect, Mr. R. Lynn); additions to shops and warehouses, in King-street and Mill-street, for Mr. John Adams (architects, Messrs. Hobart & Heron); additions to match factory, on Donegall-road, for Messrs. Maguire & Patterson (architect, Mr. S. Stevenson); 12 villas, in Sagimor-gardens, for Mr. Hugh Mills (architect and builder, Mr. R. Barton); 38 terrace houses, in Connsbrook-street, for the East Belfast Building Society; villa, in College Park, for and to the plans of Mr. D. B. Marr.

BILLINGE.—The D.C. have decided to include in the estimates for next year a sum towards the cost of the proposed widening of Gantley-road and Rainford-road, in the first case to 50 ft., and the second to 33 ft. That the cost of land, estimated at £101 for Gantley-road, be met during the next financial year, and the narrowest part of Rainford-road be widened to begin with.

BIRKENSHAW.—Plans passed: Lay-out of estate in Station-road by Messrs. Jowett & Grayshon, and garage at "The Bungalow," in Bradford-road, for Mr. Swetenham. The U.D.C. has accepted a tender amounting to £1,811 for laying a concrete causeway from the Half Way House to the boundary at Driglington. A start will be made with the work immediately the sanction of the West Riding C.C. is forthcoming.

* See also our List of Contracts, Competitions, etc.

Blackburn.—The B.G. have approved the principle of erecting a Children's Hospital and Maternity Ward apart from the present Queen's Park Hospital.

Bromley.—Plans passed by T.C.: Two houses, Woodside-road, Mr. L. Jefford; house, Bromley Common, Mr. F. G. Crickett; two bungalows, Sunningdale-road, Messrs. Ecott, Widgery & Ecott; shop, High-street, Messrs. Lyons & Co., Ltd.; two houses, Avondale-road, Mr. A. Frampton.

Bury.—Plans have been approved for a pair of bungalows and 10 houses in different parts of the town. The Plans and Streets Improvements Sub-committee have considered the carrying out of street improvements in Roch-street, Stanley-street, Clough-street and bottom of Walmersley-road. Plans were presented of the proposed new bridge over the River Irwell at Warth Fold, in connection with the new road. The Borough Engineer was instructed to carry out such repairs as were necessary at the north end of Harwood-road. The Walshaw Mission Sunday School and Chapel require tenders for painting the outside and varnishing the inside of the premises. Mr. J. Heys, 35, Church-street, Walshaw, is the secretary.——The Corporation have instructed their Engineer to enquire with respect to land required for the widening of the bridge over the Goyt in Ainsworth-road. The Bury Cinematograph Co., Ltd., have purchased the Castle Cinema, Bolton-street. Alterations and improvements will be carried out.

Carshalton.—Plans passed by U.D.C.: House, the Crossways, for Mrs. Mair; bungalow, Downsroad, for Mr. Jago; rebuilding Lower Mill, Butterhill, for Mr. C. R. Leech; five shops, High-street, for Mr. Newman; house, Upland-roads, for Mr. A. R. Wordsworth; two pairs of houses, Harrow-road, for Mr. Hutcheson; four pairs of houses, Carshalton-road, for Mr. W. J. Wyatt; ten houses, Upper Vernon-road and twelve houses, Bramley road, by Messrs. Edser & Brown; pair of houses, Windborough road, for Mr. J. W. Harrison; house, Upland road, for Mr. J. Chapman; pair of houses, Carshalton-grove, for Mr. C. T. Lawrence; 28 cottages and eight flats, for the Carshalton U.D.C.

Castleford.—Plans passed: Three houses in Charles-street, for Mr. Sainter; and one house in Pretoria-street, for Mr. Sainter.—The Surveyor has been instructed to make a 15 ft. roadway at the Markets in tar macadam.

Cheadle.—Application has been made to the D.C. for subsidy grant for houses proposed to be erected by Mr. Murphy for 12 houses on land co-extensive with Church-road; Mr. W. Whitehead for two pairs semi-detached houses in Warren-avenue; Messrs. W. H. Hammond & Co. for one pair semi-detached in Swan-lane, Cheadle Hulme. The D.C. instructed their Surveyor to prepare plans and estimates for a sewer to be provided from Wiggin's-hill to the corner of Finney-lane.

Chester-le-Street.—The R.D.C. have approved plans submitted by the Lambton and Hetton Collieries, Ltd., for the erection of six houses at Fence Houses. The Council also decided to build 20 at Lumley by direct labour. The M.H. are to be asked to sanction the granting of the subsidy for 100 houses for the three months ending March 27, 1924.

Chorley.—The T.C. have approved the following recommendations of the Unemployment Sub-Committee relating to schemes to relieve unemployment: (1) A scheme for widening, where practicable, Southport-road to 60 ft.; (2) the widening of Buxton-lane where the road bends sharply; (3) laying out and draining of the Dissenters Ground at the Cemetery. The Town Clerk has been directed to acquaint the Corporation's technical advisers, Messrs. Dodd, Dodd & Watson, with the diversion of the river Chor into the sewers to the main sewage works, for the engineering firm's consideration, the Sanitary Committee having made alternative suggestions for the treatment of the river water, which would involve no change in the amount of loan applied for.

Clitheroe.—The Surveyor has been instructed to prepare a scheme for the widening of the road on both sides near the park gates at Brungerley Bridge.

Cranbrook.—Plans passed by R.D.C.: House at Hartley, for Mr. Middleton; house at Hawkhurst, for Major Townsend.

Darwen.—The Co-operative Society have decided to make a start with the house building experiment on the Two Gates site. It is also intended to provide a reading-room at Hollins-grove on premises recently acquired.——Schemes for work for the unemployed by the D.C. include widening and improving Bog Height-road, and widening and improving footpath opposite Astley Bank.

Dublin.—Plan passed: Two shops and dwellings in Dolphin's Barn-street, for Mr. F. J. Poole.—Plans have been prepared by Mr. F. J. McAuley, architect, 24, Nassau-street, for the building of two shops and house over Dolphin's at Barn-street, for Mr. F. J. Poole

Dunbar.—The Board of Health have sanctioned the erection of four additional houses under the housing scheme, thus bringing the number up to sixteen.

Dundee.—Plans and sections of proposed new buildings, &c., in Dundee have been lodged at the office of the City Engineer: Bingham-terrace, house and garage, for Wm. Gavine; Blackness-road, house, for David McCall; Gardner-street, &c., tenements, for Dundee T.C.; Seagate, alterations for the Loyal Order of Ancient Shepherds; Shepherd's Loan, house, for Agnes H. Shand; Strathern-road, garage for Bruce, Son, & Norton.

Eastry.—Plans approved by R.D.C.: Four bungalows, Eythorne, for Mr. R. Terry; bungalow, Preston Hill, Wingham, for Mr. F. A. Pilcher.

Edinburgh.—Warrants granted by Dean of Guild Court: Messrs. M'Kendrick & Co., six houses at Saughton Hall-drive; Mr. Thomas Robertson, cottage at Saughton-road, Corstorphine.

Egremont.—Plans have been submitted to the Cumberland E.C. for the erection of a new elementary school at Thorn Hill, at an estimated cost of £16,000.

Frinton.—The U.D.C. having applied for sanction to borrow £10,000 for cliff protection and sea defence, Mr. A. W. Brightmore, of the M.H., has held an inquiry, when the surveyor (Mr. Smith) stated that it was to be a plain sea-wall of concrete, faced with granolithic blocks to form the steps. It would act also as a retaining wall.

Glamorgan.—The County E.C. proposes to acquire Gnoll House, Neath, for purpose of converting same into a school.—The Penybont R.D.C. has received a report indicating that 75 houses are contemplated by applicants for subsidy assistance, and that a further 150 houses to be erected by private enterprise are likely to be commenced upon in the course of three months. The Council has received plans of proposed new mixed explosives magazine for Messrs. Nobels Explosives Co., Ltd., at Tondu. In accordance with the Council's instruction the surveyor has prepared plans for proposed additional Council houses at Pencoed and Llangynwyd. The Aberkenfig Building Club has notified the Council of its intention to erect a further 30 houses in the Penybont area. The Council proposes to erect new gas works buildings at Aberavon. The B.C. has applied to M.H. for sanction to erect an additional 100 houses. Formal notice has been given by Mr. Aaron John Legg, of Breen Reed Hotel, Aberavon, that he proposes to build a hotel at Clyne Farm, Clyne, Neath.—The M.H. is to hold a public inquiry into application of Caerphilly U.D.C. to acquire lands for the purpose of erecting Council offices and public lavatories.—Sanction has been received by the Penarth U.D.C. to its proposal to subsidise house building. In all subsidies are approved for 52 working-class houses, 40 of which are to be built by the Penarth Mutual Building Society.

Great Yarmouth.—The T.C. has passed plans prepared by the Borough Engineer for works at the East Quay and North Pier, estimated to cost £7,500.

Hailsham.—Plans passed by R.D.C.: House, London-road, Hailsham, for Mr. M. L. Lambert, of Eastbourne; house in Station-road, Hailsham, for Mr. A. E. Mason, of Hailsham; bungalow, Newick-road, Heathfield, for Mr. W. N. C. De Mattos, of Eastbourne; bungalow in Bexhill-road, Ninfield, for Mr. A. D. Kiernander, of Bexhill; detached house in Bexhill-road, Ninfield, for Mrs. Beaumont, of Ninfield.

Hemel Hempstead.—Plans passed by R.D.C.: Bungalow for Mr. H. Harris, Frenches Farm Estate, Chipperfield; also the following plans for which a subsidy grant was requested: Pair of houses, Frenches Farm Estate, for Mr. R. Marton; two bungalows, Shantock Farm-road, for Mr. G. Steer.

Hurst.—The Housing and Town Planning Committee resolved that subsidies be granted in the following cases:—E. Marchall & Sons, four houses in Higher King-street; W. Adams, four houses in Smallshaw-lane; H. Bracegirdle, one bungalow, in Higher King-street; S. Dyson, one bungalow in Higher King-street; and Messrs. Watson Bros. & Allen, two houses in Gorsey-lane.

Ilford.—Plans passed by U.D.C.: L.C.C., three lock-up shops and dwellings, Bennetts Castle-lane (corner of Linkway); J. G. P. Meaden, alterations to cottages, Dr. Barnardo's Homes, Barkingside; T. S. Lello, bungalow, Barley-lane; P. E. Brand, Ltd., 24 houses, 3 to 26, Kingsfield-gardens, Eastern-avenue; P. E. Brand, Ltd., shop, Eastern-avenue; E. A. Russell, 7 houses, 26–38, St. Luke's-avenue; A. G. Manning, 16 houses, 29–59, St. Luke's-avenue

Jersey.—Miss E. A. Barreau has offered £8,000 for the erection and endowment of an art gallery in Jersey.

Keresley.—To meet the needs of the district where the Warwickshire Colliery Co. are building 1,000 houses, the Warwickshire C.C. intend to erect a school.

Kilkeel.—Sanction has been given to the proposal of the Council to borrow £8,000 for the purpose of a new hospital; the balance of £3,000 will be a grant from the Ministry of Labour.

Lancaster.—The Lancaster T.C. announced that the Government had approved the scheme for widening the road from Owen-road to Scale Hall corner, thereby completing the new road to Morecambe. In addition, approval has been given for the extension of the electricity mains and for the laying of a new water main to augment the Morecambe and Heysham supplies. The West Lancashire Territorial Association has purchased land at Carnforth and Prescot on which will be erected new headquarters for the local companies. The Carnforth Co., which is attached to the 5th King's Own Royal Reg., will have up-to-date headquarters, consisting of clubrooms for officers, N.C.O.'s and men, a drill hall, and a miniature rifle range. It is hoped to have the plans completed very shortly. The Prescot Company is attached to that important branch, the Divisional Signals, and it is hoped to obtain sanction to proceed with the building in the immediate future. At Horwich, too, the headquarters of the Signals are to be extended.

Leeds.—The Tramways Committee propose to carry out the work of providing new covered shelters at the tram barriers in Briggate. The plans are in course of preparation. Messrs. Reynolds & Branson, Ltd., manufacturing chemists, have acquired the shop property adjoining their own premises in Lower Briggate. These premises are to be reconstructed, and tenders for the work are to be invited by the architect, Mr. W. F. Dawson, Albion-street, Leeds.

Limehurst.—The Manchester District Regional Committee had several tentative proposals before them for new roads through the Limehurst area. These include a road from Failsworth through Woodhouses to Ashton, with a branch off to Droylsden, and another from Hurst along Lees New-road through Springhead, to join Huddersfield-road beyond Oldham. The surveyor said it was also suggested that one new road should run from Richmond-street, Ashton, across the railway to Newmarket-road, towards the north-east side of Daisy Nook and past the Crime Lake to Failsworth.

Llandudno.—The U.D.C. has decided to apply to the M.H. for sanction to borrow £5,870 to defray the cost of the erection of a golf house on the magnificent municipal links at Maesdu.

London (Hammersmith).—The L.C.C. has sanctioned the B.C. borrowing £21,938 for housing purposes.

London (Lewisham).—Plans passed by B.C.: Two houses, Stanstead-road, for P. Smith; two houses, Marvels-lane, for G. W. Crosby; 40 houses, Ewhurst-road, for A. J. Glock; four flats, Sydenham Park, for Griggs & Son; house, Chinbrook-road, for Banks-Martin, Hammond & Co.

London (Paddington).—The Baths and Wash-houses Committee is recommending that it be referred to them to prepare a detailed scheme and estimate for developing the Porchester-road frontage of "The Lodge" site by erecting thereon a public hall, shops, offices, and if practicable, a lending library.

London (St. Pancras).—Vicarage, adjoining St. Mark's Church, Regent's Park-road.

Maldon.—The T.C. has a scheme for the widening and extension of the Marine Parade at a cost of £7,878, subject to a loan being allowed and a grant being made by the Unemployment Grants Committee.

Manchester.—The Manchester Housing Committee approved a report which had been prepared in favour of acquiring 41½ acres of land lying between Old Hall-lane, Yew Tree-road and Town Planning-road No. 22 in the district of Withington. On this land it is proposed to erect 484 houses and to reserve certain sites for shops. The Governors of the Grammar School have appointed Messrs. P. S. Worthington and F. Jones, F.R.I.B.A., of 178, Oxford-street, to collaborate plans for the proposed new Grammar School to be erected on a site at Fallowfield.

Middlesbrough.—The Corporation Plans Committee have approved two sets of plans with respect to houses.

Morecambe.—Plans passed by T.C.: Mr. J. R. Richardson, eight houses in Balmoral-road; Mr. A. Rycroft, motor-house, &c., West End-road; Mrs. Nuttal, motor-house, Balmoral-road; Morecambe Corporation, engine house and laboratory at Gas Works; Atkinson & Halliday, pair of semi-detached houses in Bare-lane.

Oldbury.—The E.C has again informed the Worcester C.C. Education Authorities of the urgent necessity for the provision of a new secondary school. The present accommodation is totally inadequate for present-day requirements.

Penistone.—The U.D.C. has decided to adopt a building scheme comprising 16 houses to the acre, with a minimum ground space of 300 yards per constructed house, with a stipulated period of twelve months for the completion thereof, the Council's subsidy to be £100 per house.

Preston.—Plans passed by T.C.: W. Smirk & Sons, 10 houses, Powis-road; R. Hothersall, 10 houses, Miller-road; J. Nightingale for Miss Hollyoak, house, Addison-road; J. Nightingale for Mr. Marks, house, Addison-road; G. Moorcroft, bungalow, Ribbleton-avenue; A. C. M. Lillie for A. Topping, bungalow Mayfield-road; G. Westcott for Messrs. Boddingtons' Brewery, alterations, Long-lane; F. Howorth for W. Beetham, house, Garstang-road; F. Howorth for Messrs. Miller & Wilkinson, two houses, Woodlands-avenue; J. J. Cox, dairy, 134, Adelphi-street; A. J. T. Ellison for T. Walmsley, additions, 76, Ripon-street; W. Mather, four houses, Winckley-road; A. J. T. Ellison for T. Sumner, house, Long-lane; J. C. Muir for A. Fiddler house, Holmrook-road; M. Wade, warehouse, Tenterfield-street; E. J. Andrew for T. Southworth, house, Holme Slack-lane.——The Housing Committee recommend the Council to prepare a town-planning scheme for the whole of the land within the Borough lying at the south of Broadgate, Fishergate-hill, Fishergate, Church-street and Newhall-street. The Ribble Committee ask for authority to construct a road on the north side of the dock from the timber pond entrance to the west end of the basin, at an estimated cost of £3,908. Application is to be made to the Unemployment Grants Committee for a grant in aid of the works. The Street and Buildings Committee recommend that Addison-road from Plungington-road to Brook-street, be sett paved, and from Brook-street to the canal bridge be paved with macadam and tar slag, at an estimated cost of £8,500. They recommend that the M.T. be applied to for a grant. With regard to the arterial road, the Finance Committee have approved the amended plan showing the improvement at Deepdale-road, involving the removal of the Isolation Hospital Lodge, at a cost of £4,200, including £560 for the provision of attendants' room, waiting room, &c., at the proposed new entrance to the hospital. A Committee has been formed to consider the provision of a town's war memorial of a monumental character, and as to the site upon which it is to be erected.

Rothwell.—Plans passed by U.D.C.:—Two houses at Denby Dale-road, Durkar, for Messrs. Wilson Bros.; bungalow, Durkar Low-lane, for Mr. S. Exley; house and shop, Pontefract-road, Sharlston, for Mr. H. Taylor.

Saddleworth.—The D.C. has decided to apply for sanction to proceed with the erection of 50 houses under the subsidy scheme.

Scarborough.—Improvements at the Spa, estimated to cost between £12,000 and £14,000, were indicated at the annual meeting of the Scarborough Spa Co.

Seaton.—The application of the U.D.C. to borrow £4,250 for the construction of the eastern promenade, supported by a sea-wall to run from the existing promenade to the Chine, has been the subject of an inquiry by Mr. F. O. Stanford, M.H. Inspector.

Slough.—Plans passed by U.D.C.: Mr. E. Stues, house in Langley-lane; Miss Peacock, house in Queen's-road; Mr. J. H. Smith, house, Queen's-road.

Stratford-on-Avon.—To find work for the unemployed and accommodate increased traffic, the T.C. proposes to widen the ancient Clopton Bridge, at a cost of over £20,000.

Teignmouth.—Plans for a new hospital have been placed before the committee by Mr. Leslie Moore, F.R.I.B.A. The building suggested would include

FEBRUARY 11.—**Bathgate.**—HOUSES.—Erection of two groups of new houses (32 three-apartment houses and 20 two-apartment houses) for the Town Council. Contractors can tender for the group of 32 or the group of 20, or for both groups. All applications to be made to Mr. W. Allan, Town Clerk, Bathgate.

THE SCOTTISH BUILDER

NEW BUILDINGS IN SCOTLAND.

Cardonald.—NEW CHURCH.—At the last meeting of the Glasgow United Free Presbytery the Rev. James Muir submitted a report for the Church Extension Committee. He said that plans had been prepared for the new church at Cardonald, which provided seating accommodation for 600, and would cost £8,200.

Dumbarton.—NEW GASWORKS.—The T.C. has resolved to borrow £17,000 towards the cost of the new gasworks and the alterations at Garshake House, the total cost of which will be £133,267. The burgh engineer has received instructions to submit an offer for carrying out the work of altering Garshake House for the use of the Gas Committee and the Public Health Committee.

Kirkconnel. — SCHOOL. — The Dumfriesshire Education Authority proposes to erect a school at Kirkconnel.

Ballachulish.—HOUSES.—The Lorn District Committee of the Argyll C.C. has received a notification from the County Clerk stating that the Standing Joint Committee has given its approval to the District Committee's scheme for the erection of twelve houses at Ballachulish. They also approved of the County Council's proposal to borrow £6,800 towards the cost.

Montrose. — ACADEMY. — The Forfarshire Education Authority has decided to proceed with the erection of a new primary department in connection with Montrose Academy.

Invertiel.—NEW STATION.—It is probable that the L. & N.E. Railway will commence immediately with the erection of a new station at Invertiel, Kirkcaldy. A branch line is also to be laid from Invertiel to the Fife Coal Co.'s new pit at Seafield. It is also stated that the present passenger station at Kirkcaldy is to be brought up to the requirements of the increasing needs of the town.

Hawick.—DOUBLE COTTAGE.—The T.C. has passed plans for a double cottage at Douglas-road East, for Miss Kate Davidson.

Airdrie.—NEW SHOPS.—The Dean of Guild Court granted permission to Mr. Paul Sidonia to erect new shops and saloons at the corner of Graham and Broomknoll-streets.

Housing in Dundee.

Mr. Robert Mitchell, chief sanitary inspector, Dundee, in his annual report on the housing of the working classes, insanitary buildings, &c., states that the net increase of houses during the past year is only seven. The Corporation schemes provided 16 additional houses and private enterprise 56 separate houses, as against 25 last year. Emigration might ease the situation somewhat this summer, but he would not like it to be the excuse for a pause in building operations.

Housing Progress in Scotland.

THE following figures show the progress that has been made in State-aided housing schemes in Scotland to December 31, 1923:—

Permanent houses completed	20,320
Temporary houses completed	665
Reconstructed houses completed	101
Houses completed under the Private Subsidy Scheme	2,319
	23,405

There are 2,884 houses at present under construction in connection with housing schemes carried out by Local Authorities and Public Utility Societies.

The total amount paid by the Scottish Board of Health in respect of the 2,319 houses completed under the private subsidy schemes is £549,666 13s. 4d.

Building Trade.

A meeting of representatives of building trade employers' organisations from all the districts in Scotland was held recently in the Shipbuilders' Institute, Glasgow. Mr. James A. Baxter, Glasgow, presided, and the meeting was addressed by Mr. W. H. Nichols, President of the National Federation of Great Britain and Ireland; Mr. Forsdike, ex-President; and Mr. Cox, ex-President of the Institute of Plumbers. The following resolution was unanimously adopted: "This meeting of building trade employers of Scotland having had placed before them the advantages of co-ordination and co-operation for working conditions of national importance agrees to ally themselves through the Scottish Allied Building Trade Committee with the National Allied Building Trade Employers; it requests this committee to proceed with the examination of Scottish working conditions and to report thereon as soon as possible; in addition, it instructs its representatives to oppose strenuously the operatives' present demands for increased wages and alterations in working conditions."

New Lanarkshire School.

The Stane Primary School, Shotts, which was built at an approximate cost of £9,000, was opened recently by Dr. George Macdonald, Secretary of the Scottish Education Department.

Dr. Macdonald, in declaring the school open, said it was not entirely a novelty, but it was sufficiently so to make it worth while drawing attention to its leading features. It belonged to what was technically known as the "pavilion cross-ventilation" variety. Windows on two opposite sides of the class-rooms provided a simple and effective method of securing a free current of air. Its advantages were obvious and were becoming more and more widely recognised. The school was so laid out that a sunny exposure for every classroom was secured, a matter of first-rate importance alike for the mental and the physical health of the pupils and teachers. The structure was semi-permanent only. It was not built to last for all time, as too many of the older schools were apparently designed to do, and one result of that was that it had been comparatively inexpensive.

BUILDING TRADE WAGES IN SCOTLAND.*

THE following are the present rates of wages in the building trade in the principal towns of Scotland. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

	Masons.	Bricklayers.	Carpenters, Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Brick-layers' Labourers.	Masons' Labourers.	Plasterers' Labourers.

* These prices apply to *new buildings only*. They cover superintendence by foreman and carry a profit of 10% on the prime cost without establishment charges. A percentage of 1½ should be added for Employers' Liability and National Health and Unemployment Acts and from 1s. 6d. per £100 for Fire Insurance. The whole of the information given on this page is copyright.

PROPOSED NEW BUILDINGS.

(*Continued from* p. 200.)

adequate public and private wards, an operating theatre, X-ray department, and all that goes to equip such an institution upon the most modern lines. The cost of the scheme is £13,000, towards which £4,500 has been raised, whilst a suitable site two acres in extent has been secured.

THORNHILL.—The Cumberland County architect has submitted to a sub-committee preliminary plans for the provision of a new school at Thornhill at an estimated cost of £16,000.

TORQUAY.—At a meeting of the parishioners of St. Marychurch, plans were accepted for a parish hall to be erected at an estimated cost of £4,000.

TURTON.—The plans were approved for 16 houses in Turton-road, for Mr. Edward Lomax.

TYNEMOUTH.—Plans passed by T.C.: Open-air school, Lovaine House; five houses, Bamborough-terrace and Blanchland-terrace, by Messrs. F. R. N. Haswell & Son, for Messrs. Brannen Bros.; semi-detached houses, Kingsway, Kenners Dene, by Mr. A. K. Tasker, for Mr. H. D. Burton.

UNSWORTH.—It was decided to write to the Bury R.D.C. asking for the erection of three public conveniences.

UFFINGTON.—The surveyor to the Uffington R.D.C. has been instructed to prepare plans and obtain estimates for the construction of a new bridge at Wilsthorpe, in the meantime the surveyor is to take steps to ensure the safety of the existing bridge.

WALTHAMSTOW.—Plans passed by U.D.C.:—Shop and house, 190, Wood-street, E.J. Good; pumice store, British Xylonite Works, A. G. Barton; two houses, 23 and 25, Bromley-road, West Bros. & Pettit; dairy and covered yard, St. Mary's-road, A. G. Barton.

WANDSWORTH.—Plans passed by B.C.: Mr. F. G. Minter, gantry and store at Ferry Works, Lacy-road, Putney; Messrs. Geo. Slade & Co., Ltd., two houses, Mount Nod-road, Streatham; Mr. W. E. Silk, house, Chartfield-avenue, Putney; Messrs. W. H. Lorden & Son, Ltd., additions to warehouses and drains at the Columbia Graphaphone Co.'s premises, Bendon Valley, Springfield; Messrs. H. Somerford & Son, additions to the Westminster Bank, Ltd., 432, Streatham High-road; Messrs. G. Giles & Co., additions to Messrs. Ault & Wiborg's premises, Standen-road, Southfield; Mr. F. Waterman, for conversion into shops of 176, Upper Richmond-road, Putney; Messrs. Belfrage, Saville & Hooper, 12 houses, Sutherland-grove, Southfield; Messrs. Chapple & Fulford, eight houses in Woodfield-avenue and one in Woodfield-grove, Streatham; Mr. G. L. Elkington, 52 houses on Southfields Housing Estate, Southfield; Mr. W. F. Goodchild, six houses, Beechcroft-road, Balham; Messrs. Peacock Bros., sports pavilion, 79, West Hill; Messrs. H. Dakin & Co., Ltd., house, Genoa-avenue, Putney; Mr. G. S. Greasby, addition, 211, Longley-road, Tooting; Messrs. Wm. Akers & Co., Ltd., addition at school building at Huntingfield-road Council school, Putney; Messrs. J. Bell, Gripper and E. H. Wilkins, eight houses in Gateside-road, Balham; The Phœnix Construction Co., house, Keswick-road, Southfied; Mr. E. J. Logan, four shops in Wimbledon Park-road, Southfield; Messrs. H. Dakin & Co., Ltd., addition to the Putney High School for Girls, 35, Putney hill; Messrs. Holloway Bros. (London), Ltd., four houses, Herondale-avenue, Springfield; Messrs. Limpus & Son, house and garage, Howard's-lane; Messrs. Bridge & Co., house, Melrose-road; Messrs. Holloway Bros. (London), Ltd., Institute for Deaf and Dumb, Clapham-road, Clapham North; Messrs. THE BUILDER

A JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR.

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

VOL. CXXVI.—No. 4227. FEBRUARY 8, 1924.

THE LABOUR GOVERNMENT AND HOUSING.

THE entry of Labour into office has provided the most striking political event of our time, and among the changes which we may consider probable not a few seem likely to affect the building industry and those to whom this industry looks for finances for building projects, and direction in design. Labour has had many sarcastic words for Whitehall in the past, and it will be interesting to see whether the administrative machine will work with greater individual initiative and elasticity under Ministers less imbued with traditions of officialism than their predecessors. While we shall welcome such changes based on sound common sense, we imagine that the new heads of departments will find that changes are not simple matters, but involve a great number of considerations and points of contact with other departments of which they have yet to learn a good deal from their permanent officials. At the same time, we hope that these officials will assist that spirit of progress and economy in organisation which is just now so essential for the re-establishment of our trade, upon which the material prosperity of the country depends. After trade depression, building revival must always wait upon some accumulation of bank balances; hence, at best, prosperity in this trade is not certain to be immediate.

The new Minister of Health (Mr. Wheatley) has lost no time in displaying his interest in one of the chief Government "planks," namely, housing, and his experience and relations with labour should make him well fitted to tackle his difficult problem; further, his method of assault should be essentially different from that of his forerunners. We want no repetition of the programme initiated by the Government after the war. We were consistently against that scheme of State building with its cumbrous officialism by persons devoid of any knowledge of trade methods, and its disastrous attempt to make a corner in building materials for public benefit under the D.B.M.S. is too recent to require review. The policy of private enterprise is considered by many students of the subject to be the only one which can ever succeed in a matter of this magnitude; but success even in this direction would depend upon many factors. Mr. Wheatley, speaking last week at Glasgow, had some very plain things to say about housing conditions at the present time which we entirely endorse; nothing, anyhow in adolescence, can tend to foster crime, immorality, poor physique, and discontent, as much as insufficient and insanitary housing, and the advent of labour to power gives this matter greatly increased importance, for we may in our slums be warping the judgment and enfeebling the health of those who will, later on, guide the destinies of the nation. The Minister recognised the difficulties, which he classed under finance, labour, and materials. At the present time it is hardly possible to obtain a small house except by purchase, apart from the few opportunities which occur to those on the waiting lists of the promoters of housing schemes. The present building subsidy offers some assistance, but we think that simplified borrowing facilities for individual prospective occupiers on the security of their houses might prove a better means of financing schemes than grants in other directions. These facilities, as a matter of business, should be based partly on the construction of the house, which could be reported upon by an architect or surveyor. This would do much to check the poor construction of many new dwellings into which people often put their life's savings, only to find that the cost of repairs becomes in a few years prohibitive. Nothing is likely to uplift the masses as much as individual ownership, and should it be possible to bring this about on a large scale it is worth a campaign carefully arranged to be within the understanding of the most ignorant.

As to labour, we give the most hearty welcome to its decision, quoted in the Press last week, to co-operate with Mr. Wheatley on the subject of increasing the number of operatives. With this attitude on the subject of dilution of labour before us we are anxious to avoid any suggestion of reproaching labour for its past attitude, but it has been undoubtedly the case that the shortage in certain trades has resulted in payment beyond the standard rates, which has caused grave loss to contractors and must reflect on building prices, with the inevitable result of taking us back to the *impasse* which occurred in the Government housing scheme under Dr. Addison. Any repetition of this state of things, though it might for a time bring increased pay to a few, would finally result in stagnation and unemployment owing to high prices. What we have often said before we repeat—there is work for years awaiting the trade, and if the operatives open their doors they will not only be helping their fellows and the public, but in the end themselves. One point we should like to refer to, namely, the request by the operatives for some assurance as to continuity of work. While we feel a good deal of sympathy with those engaged in an occupation which is more or less seasonal, and hope that some steps will be taken to meet this request, we would ask the operatives not to press this matter too much. Few of us have any real guarantee of permanency in our occupations; certainly the professional man, the trader, and their dependents have, as a rule, none. Such guarantees carried out to any extent would much tend to stifle initiative, by which alone we rise and succeed, and none of us wishes to carry on his shoulders the burden of the idle and inefficient, who would be encouraged by too generous a form of guaranteed employment. Pensions and assistance for those willing but unable to carry on life's duties come in another category.

Now that dilution is definitely to be considered, we would remind those who are likely to benefit by inclusion in such a scheme of the facilities which exist for obtaining some knowledge of the various building trades in our many technical schools and institutions, and we suggest that skilled operatives should be appointed in various centres to give these men some preliminary "field" knowledge and acquaint them with the customs which will enable them to work happily with those who have served the recognised apprenticeship. That this new attitude on the part of the operatives will be acclaimed by everyone we have no doubt, and we regard it as one of the most encouraging events in connection with housing which has yet occurred. Finally, materials will call for Mr. Wheatley's consideration. There will no doubt be a strong upward tendency in prices when any large scheme of house building develops, and the Government has already made its voice heard on this subject. The best way to prevent increased costs is to stimulate production, in which matter those responsible for transport can assist very greatly. For a long time rail costs for heavy goods have been a menace to trade revival, and we hope that the new Minister, to whom we wish every success in his great undertaking, will confer with his colleague, the Minister of Transport, on this method of stimulating production.

NOTES.

A Bargain. Will architects view with pleasure the arrangements now made by a certain Town Council for the purchase of standard cottage designs from their surveyor at five guineas per set and the sale of copies at two guineas a set to prospective builders? If they are very good designs it will be quite cheap art. Architects will hardly be eager to enter into competition with this kind of enterprise, but it does look like a quite profitable affair for the Council.

The Fine Arts Commission. As one might have expected, the appointment of a Fine Arts Commission has led to much criticism, a good deal of which may be discounted. And, considering the results of the Fine Arts Commission in New York, it is hardly wise to condemn quickly and hotly the establishment of such a body. Naturally the composition of the Commission will not please everybody, and it is just as unfair to focus criticism too violently on the attainments of its members as it is to allow no preacher to preach because he does not in himself sum up all the virtues. There is, however, something to the point in the letter we publish to-day from the British Confederation of Arts. We have too many loose ends in our activities for reform, and a closer union of all those bodies which are working for the better understanding and use of art is much to be desired. There are infinite degrees of beauty and refinement amongst all workers in the arts, and most folk are unfortunately content with a low standard of quality in our coinage, our street lamps, our railway stations, our tea cups, our processional displays, our river banks, our telephone kiosks, our beer mugs, our commercial buildings, and all the things we have to use and look at every day. No commission can insist on the betterment of all these things, and perhaps it is as well it should not have the power to do so, but the mere fact of a Fine Arts Commission being appointed should count for good. It certainly should be composed of the soundest intelligence, the broadest sympathy, the keenest vision, and the loftiest ideality we can command. If it is not representative of the best we have amongst us it is handicapped from the beginning.

Density in Glasgow. Mr. James Stewart, Under Secretary of Health for Scotland, is reported to have informed the Glasgow authorities that they would not be allowed to build houses in excess of 24 to the acre. It appears that the authorities, in clearing slum areas, proposed building at 48 to the acre. This exactly illustrates what we have constantly urged—that the refusal of the late Government to limit the number of houses to the acre was disastrous folly. If the report is correct and Glasgow really intended to build 48 *houses* to the acre we can only stand amazed, but if the intention was to build 48 *tenements* to the acre we would refer the authorities to the findings of the Royal Commission on the Housing of the Industrial Population of Scotland, Rural and Urban (1911), in which it is emphasised that not more than 32 tenements, to be of three stories, should be built to the acre and that this recommendation should be embodied without delay in an Act of Parliament. What a farce it is! Royal Commissions sit and collect evidence for months. For months the best brains available sift the evidence and produce a comprehensive scheme for future guidance. The Government of the day then acts as if the Commission had never existed. That is the usual procedure, and we hope that the new Government will break the tradition.

Cross Traffic Improvements. We have heard it said that the average successful grocer manages his affairs with more foresight than does a great community of citizens. But London is so vast a congregation of humanity, with interests so varied and often conflicting, that no dominant controlling force has been found yet to work for the common good. We find this difficulty put forward on Tuesday by a writer in the *Morning Post*, who says our difficulty is that where other nations bite we only nibble, or else we might create underground subways to provide for great streams of cross traffic. He instances the terrible aggregate of wasted time at such a point as Oxford-circus, which would be obviated by a "dive" which could be made at a comparatively small cost and without affecting superficial conditions. Abolish horses and improve cross traffic, says the writer. "If we go on for another fifty years without doing either, it will be because what we call the London traffic problem represents the thwarted ideal of the hustler rather than the crying need of the public as a whole."

Town Planning. How many educated men, if they were asked in a general knowledge paper to define "Town Planning," could do so even in the vaguest manner? Nine out of ten would say it meant putting up some kind of building or erecting garden suburbs; one might go

British Empire Exhibition: Newfoundland Building.

Messrs. J. W. Simpson & Maxwell Ayrton, FF.R.I.B.A., Architects.

further and say that a large percentage of those in office on local authorities, builders, and even architects, would be found wanting in an elementary understanding of what is to become one of our greatest practical sciences of the future. The Ministry of Health, having suffered much from the ignorance of earnest inquirers, has issued a pamphlet on this subject, and we recommend those of our readers who would fail in the general knowledge question to study this explanatory pamphlet.

The Subject and the Method. There is a significance not to be missed in the appearance of a work on "Britain Beautiful." We welcome all such publications and we imagine the appeal will prove irresistible to thousands. Though much might be offered in criticism as to the mechanical methods employed, everyone may be something the richer and better informed from acquaintance with a publication which illustrates so many of the treasures of our wonderful little island, which are practically inexhaustible. Architecture and landscape appear to come in for a fairly equal share of attention; but what a series of books illustrative of the best aspects of our land and its building might be published! The cost would be prodigious and the public might not value it at its true worth, but it requires little imagination to visualise the charm of a publication on such a subject if dealt with sympathetically by the scores of able artists in the world to-day who are now only half employed. It would, perhaps, need the enterprise and vision of an American business man to tackle such a vast and wonderful subject.

Classic Tradition. "Despite our temporary infidelities, we are still men of the Renaissance," says a writer in *House and Garden*. Well, our lives are certainly pretty well salted with infidelities to-day, but the main concern of those who want beautiful building should be to find a something which is not necessarily bound up with a style or a tradition, or to seek a feeling for fine proportion and distinction of line, mass, and detail as our main concern, and then the battle of styles will be a matter of secondary importance. We may note, by the way, that those who call most loudly for a free hand as regards all styles and traditions give us little or nothing themselves to justify that freedom.

A Unique Church Window. Few parish churches in England have escaped the pious memorials of the Victorian era, and since the principle of safety-first rightly conserves the bad with the good, we must accept the continued prospect of acres of crude magenta, bog green, Reckit's blue, and gamboge illustrating scenes from the Old Testament in ill-leaded stained glass, until time, extending beyond our generation, may lend a mellowing influence. Mercifully only a small proportion of such artistic outrages are to be found in English churches, but in Ireland, where practically all ecclesiastical architecture is nineteenth-century work, these witnesses to devout grandeur persist. And yet it is in an Irish church overlooking Glengariff Bay that a notable exception may be seen. One of the Ladies Bantry inserted there a clear plate-glass window, at a date when magenta was reserved for churches, and plate glass for noblemen's mansions. Under this window, from whence the blue bay and purple hills can be seen receding into the distance, are engraved the words: "*The Hea ens declare the Glory of God and the Firmament showeth His Handiwork.*" As a lasting tribute to good taste this memorial is probably unique.

How Buildings are Spoiled: Bush House, from the Refuge in Kingsway.

The Roubiliac Models. The three models by Roubiliac, an eighteenth-century sculptor, found in the Triforium at Westminster Abbey have the interest which attaches to the character of such a find—which is not great. This is one of those cases in which the old is not necessarily good, and these models, so florid, pompous and artificial in their character, have but little interest artistically. In fact, it would not be too much to say that both in design and character they represent everything that is most artificial, and, therefore, undesirable in the art of the sculptor. We may feel sorry for the troubles which surrounded Roubiliac, but he was the sycophant of a court, waiting on greatness and lending his genius to the soul of fashionable tableau art, which appealed by its pseudo-magnificence to the courtesan and the courtier, but was offensive to anything better. And the discovery of these models, though interesting as a record of the time, have little other interest to recommend them.

Individualism in Church Monuments. There has been a great improvement in the private memorials we see erected in our parish churches and elsewhere, but it would be an admirable practice for the Church Council or authorities to keep a list, prepared by the architect, of accessories still required in a church or chapel, and which a giver could consult without further responsibility in the choice of design. This plan has been admirably executed in the Sandhurst College Memorial Chapel, and in connection with it one can only pass a single comment—that it might have been better if the names of individual donors and of those whom they wish to remember had been inscribed in a special book of commemoration instead of being lettered on some adjacent column, apparently promiscuously, but intended to imply that a lamp, lectern, or crucifix near by had been presented in special memory. The beautiful lettered panels of the various regiments are a sufficient roll of honour, without these extra individual intrusions, however well executed, and they somewhat lessen the poignancy of the memorial as a corporate witness.

GENERAL NEWS.

Management of Landed Estates.

Mr. A. J. Burrows, F.S.I., F.A.I., gave the first of a series of two lectures on the subject of the "Management of Landed Estates" at the College of Estate Management on Friday last week. At the commencement of his lecture Mr. Burrows dealt with the necessary qualifications of a land agent, and then passed on to describe a typical estate and the work to be done thereon, such as the letting and the management of farms, small holdings and allotments. The lecturer also dealt with repairs and discussed the best system of carrying these out. He also went very fully into the question of the various kinds of improvements to be done to an estate such as the provision of new buildings, drainage and fruit planting. In conclusion the lecturer dealt with outgoings, and the rates and taxes with which it would be the duty of the land agent to deal.

Architect's Estate.

William Hawley Lloyd, of Leamington Priors, formerly of Birmingham, architect, who made contingent bequests to the Church Missionary Society for Africa, the Royal Midland Counties Home for Incurables and the Church Pastoral Aid Society, left estate value £32,912.

R.I.B.A. Visiting Board.

The Council of the R.I.B.A. on the recommendation of the Board of Architectural Education have approved the creation of a Visiting Board to visit and report upon all Schools of Architecture applying for or enjoying exemption from the Royal Institute Examinations. The following have been appointed to constitute the Visiting Board:—

Mr. Paul Waterhouse, Mr. W. Curtis Green (Chairman of the Board of Architectural Education), Mr. Maurice E. Webb (Vice-Chairman of the Board of Architectural Education), Professor C. H. Reilly, O.B.E. (Roscoe Professor of Architecture, University of Liverpool). H.M. Inspector, Mr. M. S. Briggs, will accompany the Visiting Board upon their visits to those Schools of Architecture which have official relations with H.M. Board of Education.

Town-Planning Regulations.

A Supplement embodying amendments of, and additions to, the Model Clauses for use in the Preparation of Town-Planning Schemes has been issued by the Ministry of Health. (London: H.M. Stationery Office; price 9d. net). The Supplement relates to the regulation of streets under town-planning schemes and by-laws; revision of standard specifications for street works; approval of orders by the Minister of Health; power to reserve land for streets not shown on the map; leave of Minister to be obtained before appealing; and minor amendments.

Obituary.

Mr. C. W. Reeves, A.R.I.B.A., died at Charing Cross Hospital on January 15, 1924, aged 70 years. On the previous Saturday he was knocked down by a taxicab when crossing Wellington-street, Strand, and received such severe injuries that from the first there was no prospect of his recovery.

The son of the Surveyor to the Metropolitan Police, he was articled to the late Mr. H. O. Chislett, of Wimborne, and then came to London where, for a few years, he was an assistant in the office of Messrs. E. Habershon & Brock, whom he left to commence practice upon his own account. For a short time he was at 102, Guildford-street, and at 25, Bedford-row, and in 1884 he removed to 3, Gray's Inn-square, where he had practised ever since.

Mr. Reeves was surveyor to the Masters of the Bench of the Honourable Society of Gray's Inn, architect to the Managers and Governors of the St. Clement Danes Holborn Estate Charity, surveyor to the Rhodes Trust, and surveyor to several building societies.

He was well known as a capable and practical surveyor in party wall matters, ancient light cases, dilapidations and all matters appertaining to a surveyor's practice.

Mr. Reeves carried out a fair amount of architectural work, amongst which may be mentioned the following:—

Considerable alterations and additions to the War Memorial Hospital, Enfield; large bottling stores and warehouses for Messrs. Robert Porter & Co., in London and Liverpool; London Central Cold Storage; new Common Room and Class Rooms, Gray's Inn; new premises for Messrs. Ridgway's, Ltd., at 40–42, King William-street, E.C. (both the foregoing were exhibited at the Royal Academy); nurses' hostel in Francis-street, W.; parish room, Lady Chapel and memorial screen at St. Mary Magdalene, Enfield; St. Clement Danes Schools, Drury-lane; and numerous private houses at Enfield, Sunningdale, Waltham St. Lawrence and Purley.

In 1914 Mr. Reeves took his son, Mr. Charles W. Reeves, into partnership, and in 1921 Mr. Alfred R. Rason, who had been with him for nearly forty years, the firm being known as Reeves, Son & Rason.

Mr. Reeves was elected Associate in 1880.

Church of St. Julien, Brioude. (*See p.* 211.)

COMPETITION NEWS

Masonic Peace Memorial.

The following report of the Special Committee has been approved by Grand Lodge:—

"It is proposed to issue an invitation to architects to submit designs and plans for the new building in competition. This competition is to be open to all architects, and to be conducted in two stages; a first or sketch competition, and a second or final competition. Not fewer than ten designs will be selected from those submitted in the first competition, and of these a further selection will be made of six designs, the authors of which will be invited to submit detailed plans and designs in the second or final competition. Each of the six architects submitting a *bona-fide* design in the final competition will receive an honorarium of 300 guineas. Three assessors will be appointed: an architect, to be nominated by the President of the Royal Institute of British Architects; an architect who is a Freemason, to be nominated by the Special Committee; and the Grand Superintendent of Works for the time being. The conditions governing both competitions will be in accordance with the Regulations of the Royal Institute of British Architects for Architectural Competitions.

"It is proposed to treat the whole of the property of Grand Lodge, being the area bounded by Middle-yard, Great Queen-street, Wild-street, and Wild-court, including the sites of Mark Masons' Hall, the Connaught Rooms, Freemasons' Hall, and the properties between Freemasons' Hall and Wild-street as a cleared site. The designs to be submitted in competition will provide for a building to cover eventually the whole of this land.

"It is intended first to provide and complete on the site between Wild-street and Freemasons' Hall the new Temple and such accommodation as will replace as far as possible that existing in the present Freemasons' Hall, thus limiting to a minimum the disturbance of the executive and other work now carried on in that building.

"The new building will contain:—(1) A large temple with seating capacity for 2,000 persons, with separate cloak rooms and lavatory accommodation, registration hall, and vestibules and scrutineers' room; (2) administrative offices adequate to the growing needs of the craft, including a suite of rooms for the Grand Secretary and Assistant Grand Secretary, with rooms for personal clerks, and waiting rooms, a general staff clerks' office, register room, muniment rooms, and board and committee rooms, with all necessary conveniences; (3) the needed increased accommodation for the Grand Master, Grand Officers, and Past Grand Officers; (4) a suite of large rooms for the use of London, provincial, district and other visitors, to include a reading and writing room, smoking room, three conference rooms, a locker room, lavatories with dressing rooms, bathrooms, and the like; (5) a library and a museum, with librarian's rooms and strong room; (6) not fewer than fifteen Lodge and Chapter rooms, varying in size from a room to hold 600 for meetings of Grand Chapter, and the Great Masonic Assemblies, and rooms for large Lodges with attendances of from 150 to 400, to small rooms suitable for attendances of 30 to 50; all these will have ante-rooms with separate candidates' rooms; (7) store-rooms adjacent to each Lodge room, where books, records and other Lodge property may be kept for the convenience of Lodges.

"That part of the building containing the Lodge rooms and store-rooms is to be so designed structurally as to allow of the addition of further floors of Lodge rooms in the future as occasion may require."

Royal Masonic Institution for Boys: Junior School, Bushey, Herts.

The drawings submitted by architects in the limited competition for a Junior School for Boys at Bushey, Herts, will be on exhibition in the board-room at the offices of the Institution, 26, Great Queen-street, W.C.2, between the hours of 10 o'clock and 5 o'clock from February 18 to 22. Members of the profession will be admitted on presentation of their cards.

Port Talbot.

The premium of £20 offered by the Borough of Port Talbot for the best design for entrance gates for the Talbot Memorial Park has been awarded to Mrs. Morris Gray, of Penrith.

Edmonton War Memorial.

The Council has accepted the design of Messrs. William Griffiths & Co., Ltd., London, for this competition.

Ashton-under-Lyne.

The design and tender of Messrs. Johnson's Reinforced Concrete Engineering Co., of Manchester, has been provisionally accepted for the bridge over the River Medlock.

Other Competitions.

Other competitions still open include the following (the dates given are, first the sending-in date, and second the issue of *The Builder* in which full particulars were given):—Essays on Heating and Ventilating (Mar. 31; Nov. 9, 1923). Holmside Hospital (Feb. 14; Dec. 14, 1923). Industrial Designs (June; Dec. 21, 1923). National Theatre (April 26). Monument to Sir Wilfrid Laurier (April 3; Dec. 14, 1923). Belfast Union Lighting (March; Nov. 9, 1923). Dunfermline War Memorial (March 8; Dec. 28, 1923). Newcastle Concert Hall (March 1; Oct. 26, 1923). Ross-Smith Memorial (Sept. 30; Feb. 1). Newcastle Fire Station (March 27; Feb. 1).

TOWERS AND SPIRES.

By SIDNEY TOY, F.S.A., A.R.I.B.A.

V.—CHURCH OF ST. PAUL, ISSOIRE.

A skilful method of treatment of the crossing and the tower over it was developed during the eleventh and twelfth centuries in the French province of Auvergne. Conspicuous examples of the principles adopted are afforded by the churches of Issoire, situated in the centre of the province, of St. Nectaire, St. Saturnin, Notre Dame du Port Clermont, and of Brioude. In many cases, as at St. Nectaire, Notre Dame du Port Clermont, and Brioude, the tower has been rebuilt in modern times, and probably the only church of this group which remains intact is that of St. Saturnin. This church dates from the end of the eleventh or beginning of the twelfth century. It is one of the smaller examples, but possesses the general characteristics of the type and preserves its original tower with stone spire.

The church of St. Paul at Issoire, built in the twelfth century, is the largest of this class and is typical of the work of the school, both in respect to the general plan and in the disposition of the crossing and tower. Although in the course of ages the tower has undergone minor alterations, and perhaps additions, its lower part appears to be substantially original.* At the crossing the plan of the church (Fig. 10) is disposed in a normal manner and differs little from that prevailing elsewhere at the period, but as the walls rise towards the vaults the distinctive character of the design becomes more pronounced (Fig. 11). The four arches of the crossing are carried to a considerable height and the crossing itself is covered by a dome raised sufficiently above the arches to allow space for windows below it and over the chancel roof. At the angles the dome is supported on well-designed squinch arches, and in order to restrict their span, and consequently their thrust on the walls, the dome is somewhat distorted in shape, as indicated on the plan (Fig. 10). The vaults of the north and south transepts are not continued to the walls of the tower as are those of the choir and nave, and as was usual elsewhere, but are stopped by transverse arches, thrown across between the portions A and B (Fig. 10). By means of these arches the bays of the transepts A.A., adjacent to the tower, are carried up a stage higher than the bays B.B. They are lighted by an additional clerestory and are covered by half-barrel vaults which abut against the dome over the crossing.

The advantages of this arrangement from a purely constructive point of view will be apparent on an examination of Fig. 11. The lateral pressures are received well up in the height of the tower by the half-barrel vaults of the transepts and are spread over the full extent of the building north and south. The vault of the nave is carried up to a greater height than that of the choir and abuts against the squinch arches, so that practically the whole of the pressure of the tower is converted into a dead-weight, which is in itself sufficient to neutralise the lower thrusts of the dome, and is carried by the four great pillars of the crossing. Æsthetically, also, the improvement is very considerable. By means of the windows in the additional clerestory of the transept, and of those immediately below the dome, the crossing of an otherwise sombre church is flooded by an agreeable light. In order that the walls above the great arches should not impede the circulation of light they are pierced with arcades, as seen in Fig. 11.

The external effect of this method of construction is well seen in Fig. 12, a photograph from the south-east of the church. By this manner of piling up the central portion of the structure tier on tier in diminishing stages and culminating in the tower the building acquires a dignity and repose which are most striking. The break between the upper clerestory and the tower is a little abrupt, due doubtless to alterations, and the present low timber spire somewhat detracts from the effect. But the original design, if one may infer from the analogy of the early work at St. Saturnin, and if carried out, would have produced a most inspiring structure. The stone spire of the church of St. Saturnin springs directly from the top of the walls of the tower.

* M. Viollet-le-Duc, in his "Histoire de l'architecture," Vol. IX, p. 220, says that the upper part of this tower has been disfigured and deprived of much of its primitive grace. But the drawing he gives, *op. cit.* p. 219, presumably embodying his conception of the original or intended condition of the structure, is widely conjectural and not very convincing.

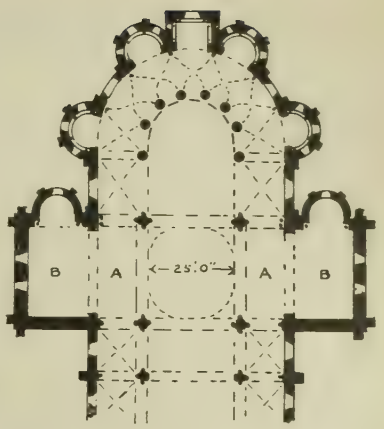

Fig. 10.—Plan of St. Paul's, Issoire.

Building Costs in London.

Answering a question at the London County Council as to the cost of the smallest type of house now being built by the Council, Lieut.-Colonel Levita said that the cost of a three-roomed house, including roads and sewers, on the Council's estate, was £510, and the lowest remunerative weekly rent was 13s. 6d. per week, exclusive of rates. The actual rent charged was 9s. 6d. a week, exclusive of rates.

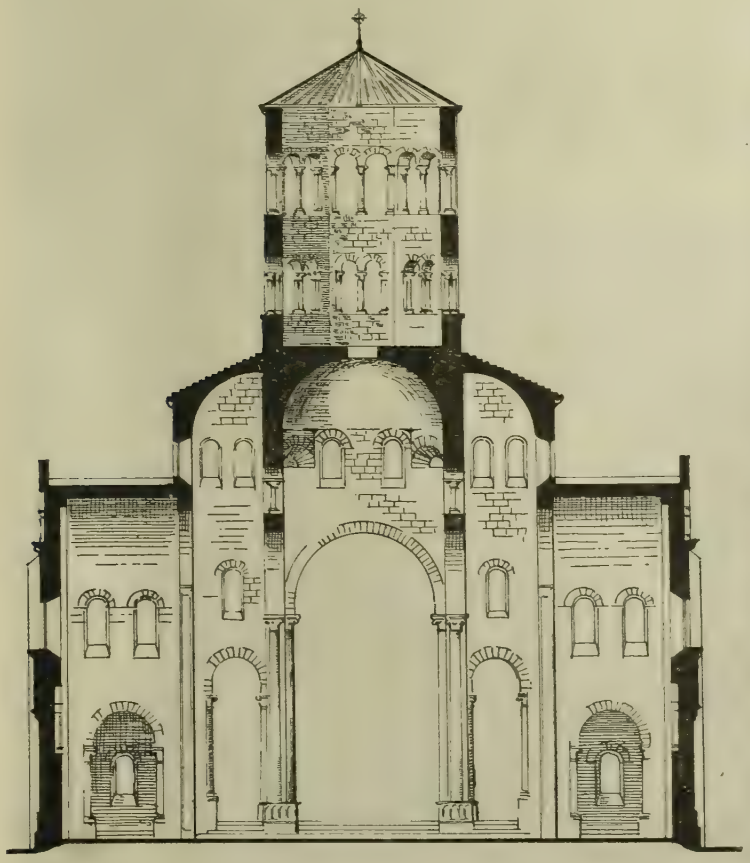

Fig. 11.—Church of St. Paul, Issoire: Section through Transept.

Fig. 12.—Church of St. Paul, Issoire.

CORRESPONDENCE.

Posters and Advertising.

Sir,—I have noted in the Press of late that an important conference of advertisers is soon to be held in London, the American organisers of which state "that advertising in this country is still in its infancy"; in consequence of which a huge advertising campaign is to be launched throughout the country.

I am strongly of opinion that should this be successful it will be at the expense of our few treasured possessions in the way of landscape, architecture, &c. I, for one, certainly think that already we have far too many posters, and that the ever-increasing electric sky signs of the West-end are "vulgar and inartistic" at night, whilst their appearance during the day, "sprawling right across architectural refinements" which are the product of years of study, is greatly to be deplored.

If, on the other hand, the advertisers really wish to improve English advertising, why not encourage really artistic posters, and in lieu of our present garish night signs "flood light" the buildings as a few West-end firms have done?

I feel sure that if the conference follows something on these lines it will achieve success, produce a "Brighter London," and at the same time encourage an appreciation of architecture, which appears to be sadly lacking in this country at the present moment.

Sidney H. Loweth, A.R.I.B.A.

London.

Estimating.

Sir,—Being interested in the subject of estimating, I read Mr. Sumner Smith's paper on the "Principles and Practice of Estimating," published in your issue of the 18th ult. I regret that his remarks did not add to my knowledge.

I quite agree that, as far as possible, estimating should be done on scientific lines. The cost of a yard cube of concrete, however, may be obtained with accuracy without entering into elaborate calculations as to voids. Writing as one with practical experience in the matter, I do not hesitate to say that the only safe method of obtaining the exact amount of material in concrete to a definite specification is by an actual test. The method which I use is as follows:—

I obtain samples of the materials proposed to be used and weigh measured quantities of each, thus obtaining their respective weights per yard cube. This information is most essential as one usually buys by the ton and uses by the yard cube. Supposing that the specification is four parts broken granite, two parts sand, one part cement. I then take four cube ft. of the granite, two cube ft. of sand and one cube ft. of cement, mix them in the usual manner, dry and wet, exactly as they would be done on the job. I then carefully take the measurement of the mixed concrete, after thoroughly ramming into a suitable gauge box. The volume of concrete produced is found to be about 4⅝ cube ft. This will vary with the different material used. This information is all we require to price out our concrete.

We will suppose that the broken granite costs 20s. per yard cube delivered on the site, the sand 10s., and the cement 80s. The price per yard cube would be obtained from the price per ton by the ascertained weights.

Now, 4 yds. cube	granite	at 20s.	= 80s.
2 „ „	sand	„ 10s.	= 20s.
1 „ „	cement	„ 80s.	= 80s.
7 „ „	mixture		= 180s.

This makes 4⅝ yards cube concrete. Thus the concrete material costs 38s. 7d. per yard cube, to which we add the labour. If one is continually using the same class of material to the same specification, it is convenient to evolve a formula in cwts. of the materials to the yard cube, and keep for reference.

With regard to water for the concrete, in this part of the country it is usual to pay for the water on a contract, at a rate fixed by the amount of the contract and not by the gallon.

W. S.

Burton-on-Trent.

Towers and Spires: An Appreciation.

Sir,—In the first of the above series, published on Jan. 11, the centering shown in the cross section of Salisbury spire is the first I have seen in print during the fifty-two years I have been reading *The Builder*. I have looked through Wicke's, Fletcher's, and Gwilt's works on Architecture, and find it is not mentioned. In Francis Bond's book it is mentioned but not shown, but he states the thickness of stone in the spire is 9 in. at the base and 7 in. near the capstone. Perhaps Mr. Toy would oblige by stating which is the correct thickness.

Edward Vale.

Weston-super-Mare.

Menai Bridge.

Sir,—Your correspondent, "H. C.," appears to be in error with respect to arched bridges carried out in reinforced concrete. The largest reinforced concrete arch known to me is the Sergolomento Bridge, of 328 ft., at Rome. There are also many steel truss girder bridges in one span up to the 720 ft. span of the Metropolis Bridge in the United States, but these cases are hardly relevant to the matter.

I do not, however, doubt the practicability of building a 500 ft. concrete arch at Menai.

W. H. T.

London.

Sir,—Will you permit me to close this correspondence by saying that in the reference to "Telford's graceful structure" ought not to be read a denial of a like attraction in one of ferro concrete, and to point out that "H. C." has not answered my first letter?

A. Henthorn Stott.

British Confederation of Arts.

Sir,—As an organising council which aims at confederating the associations and societies of workers in the arts, we note the official setting up of a Fine Arts Commission to advise the Government and other public bodies and to "form the taste of the nation."

While agreeing that such a Commission may do valuable work, we believe that as various bodies representing the different points of view of workers in the arts in this country are in existence such bodies—through their accredited representatives—should be brought into consultation and facilities should be afforded for a more representative Commission.

We would point out that many arts are untouched by the present proposals, such as the art of the theatre, which so largely influences public tastes; the industrial arts which go to every home and without which advice cannot be adequately given with regard to interior decoration of public buildings; and arts in their educational aspect, as from schools and training colleges, which all have a most obvious influence on national tastes.

A. Sedgwick, *Hon. Sec.*

British Confederation of Arts.

British Empire Exhibition: East Africa Building.

Messrs. J. W. Simpson & Maxwell Ayrton, FF.R.I.B.A., Architects.

Mr. J. Alfred Gotch, President of the Royal Institute of British Architects, delivered the Annual Address to architectural students on February 4.

In the course of his address he said there were few things by which youth was more readily annoyed than by advice from its elders, those persons who had acquired so much wisdom as to have lost their enthusiasms, who were full of tediousness, and yet, like Dogberry, could find it in their heart, were they as tedious as a king, to bestow it all upon their juniors. But he would beg them, for that night at least, not to look upon him as a tedious elder, but as a student, as one student speaking to another, for he protested that he was still a student of architecture, and hoped to remain one to the end of his days.

He would like to remind them of what, no doubt, they were already fully convinced in their own hearts, that the future of English architecture lay with them. It was their duty, or shortly would be, to guide public taste into the right channels; to apply the logic of design to new methods of construction; to solve their problems with unstinted ingenuity; to maintain a high standard of conduct in the pursuit of their calling.

That reflection, divested of the delightful vain-glory proper to youth, was sufficiently sobering; but sobering though it was, it need not be paralysing. On the contrary, the thought was in the highest degree inspiring, and there was no more powerful aid to the doing of great things than inspiration. But inspiration, if it were to be fruitful, must descend upon congenial and receptive minds, and having entered it must discover, not an empty chamber, but one well equipped. It was to gain the necessary equipment that they had become students of architecture under the auspices of the Royal Institute.

When he contrasted the methods of initiation into the mysteries of their craft, which it was given to them to employ, with those vouchsafed to their forerunners, he was filled with envy and admiration. They had the help of experienced teachers; they had excellent appliances, and an inspiriting *esprit de corps*; they were able, with a sense of leisure, to devote their days through a series of years to the study of their art. But how was it in the old times? There were then no schools save that of the Royal Academy, unless they took into account a number of schools of art in which, however, architecture was not fully understood. The young architect then learnt his art in an office, supplementing it in some cases by attending classes in the evening where they were available, or snatching reluctant leave from his daily duties to attend lectures in the daytime, if they were within his reach. But these supplementary opportunities for acquiring theoretical knowledge were confined to a few very large towns, and among such opportunities stood out most conspicuously the Architectural Association. This was not the occasion to dwell on the admirable work of that institution; what was germane to the subject was that its work was done in the evening after office work was over.

It was true that among the young architects struggling to teach themselves there were a few fortunate and gifted individuals who entered the Academy School or even travelled as far as the Ecole des Beaux Arts at Paris.

The old haphazard way of learning to be an architect had been replaced by a regular course of study, but its effect on the public mind appeared not yet to have passed away; for too often they found that members of the public, and, in particular, public bodies, were under the impression that no great amount of training was necessary for an architect, that anyone whose training was remotely allied to architecture, or, for the matter of that, who had had hardly any training at all, was competent to carry out architectural work. They did not realise that in the old days the study was as severe, although not so well regulated, as it was at present.

But that there was a great deal more which went to the making of an architect than that which appeared upon the surface was sufficiently proved by the number and variety of the prizes and studentships which were offered for competition by the Institute. He was sorry to see that full advantage had not been taken of the opportunities so offered. The number of competitors had been small, and some of the work submitted had not been of merit enough to justify the award. The Essay Prize had not been awarded, nor the Pugin Studentship, nor the Grissell Medal. These prizes were for work which affected education in different directions. The essay tested the writer's knowledge of his subject and his ability to convey that knowledge in an agreeable manner; in other words, it tested his literary skill. It was a pity that some of the younger architects did not cultivate a literary style, for so few of them seemed able to rise above the level of the graces of the specification that the road to distinction in this direction was but little obstructed and seemed to invite more traffic.

The decline of the Pugin Studentship was to be deplored, for the work submitted in competition need not be specially prepared, but might be the student's own sketches made on his holidays and the outcome of his recreations.

What were the reasons for the falling-off in candidates this year? One was said to be the fact that students were so fully occupied in the work of the schools as to have no leisure for competing for the admirable prizes of the Institute. But he had heard there might be another reason: that students were impatient at the long course of study necessary to master the art of architecture as now conceived; that they had visions of a new style free from the shackles and conventions of the past; that they thought they could strike out a new line of their own.

Imagination, continued the President, was one of the most enviable possessions of the artist, who might also conceivably be an architect; imagination could lift him from earth to heaven. But for heaven's sake, and for earth's sake too, he asked them not to imagine that a new style of architecture could be invented even by the most gifted student in the full flush of his intuitive perceptions. They were all prone to wish that it could be so, and some, maybe, thought it actually possible; but all history taught the contrary. Wherever they looked they found that changes had been gradual, whether they examined architecture, or mankind, or the universe itself. Violent upheavals there had been in the framework of the earth, but their range had been limited and they had not changed the essential development of the great globe. Violent upheavals had occurred among mankind, but they had not permanently affected the orderly processes which controlled its fate.

In architecture no violent upheaval had occurred. The most distinct change to which it had been subjected was that which they called the Renaissance, when Gothic architecture was superseded by the revived classic. But even that change was not entirely abrupt. To take their own case in England, where there was no other tradition than the Gothic: more than a hundred years elapsed between the invasion of the new classic detail, in the shape of Torrigiano's tomb for Henry VII in Westminster Abbey, and the erection of the first building absolutely free from all trace of Gothic ancestry, in the shape of Inigo Jones's Banqueting House at Whitehall. But these very examples were subject to reservations. For the recumbent figures of Torrigiano's Italian tomb were still those of the Gothic tradition. Foreigner though he was, and imbued with foreign ideas, he was unable to free himself wholly from the influence of his new surroundings. Inigo Jones himself, in his early work, made use of traditional methods of design, and although he ignored them in later years, his contemporaries were unable to do so, but still succumbed to the spell of the past. What the giants of old could not do, the giants of to-day, even the youngest, could hardly hope to achieve: the inevitable conditions of architectural design were too stubborn.

He was convinced that they would better advance their art by pushing forward in the same direction as their predecessors, and towards which they had turned their faces, than by making excursions into the uncharted wilderness on either hand. But he spoke from beneath a certain weight of years: they had all the resilience of youth. Long might they retain it! And when the exuberance of youth should have passed, and they began to look back upon the past, rather than forward to the future, might they be conscious that they had always striven after those qualities of fine architecture which shone through all the incrustations of changing styles—proportion, gracefulness, and masterly ease.

After the conclusion of Mr. Gotch's address followed the presentation of prizes and studentships for the year; and a criticism of the work of the students by Mr. Henry M. Fletcher, F.R.I.B.A.

At the close of the proceedings, a vote of thanks to the President was moved by Mr. E. J. Partridge (President of the Society of Architects), and seconded by Brig.-General G. H. Gater, C.M.G. (Education Officer of the London County Council).

THE ROMANCE OF THE ROMAN FORUM.

Sir Banister Fletcher lectured recently on "Ancient Architecture" at the Central School of Arts and Crafts. It was the second of the term's lectures, and he described the plan of ancient Rome on her seven hills, with the great Forum Romanum in the central valley. The Capitoline Hill dominated this public-meeting place on one side and the Palatine Hill, with its imperial palaces, on the other. The Forum Romanum was the heart of Roman civic life, and held much the same position as the Acropolis of ancient Athens, only that, for the practical Roman, it included the commerce of the city and was flanked by temples of the gods and courts of justice. Here political demonstrations were held, as they were now held in Trafalgar-square, and from the rostrum orators addressed the populace on matters of stage, and demagogues harangued the "plebs" and instilled the spirit of discontent. Stately colonnades, spacious basilicas, and the majestic temples of a state religion all made a fitting setting for the activities of Roman citizens. Here the old Romans walked and talked, bargained, intrigued and worshipped. But the city grew with its growing empire, and successive emperors, eager to ingratiate themselves with the people, built other forums for the people which rivalled in size, but never in importance, the old Forum Romanum of the citizens. All these Forums were monuments to their Imperial founders and ornaments to the city. Once hives of human activity, they were now dead sites—broken records of a greatness that had passed.

Sir Banister's third lecture at the Central School of Arts and Crafts, was delivered on January 30, and dealt with the circular temples and basilicas, or courts of justice, of the Romans.

LEEDS ARCHITECTURAL SOCIETY.

The annual dinner of the Leeds and West Yorkshire Architectural Society was held at the Great Northern Hotel, Leeds, on Thursday, January 24, and took the form of a Literary Dinner. The President of the Society (Mr. Eric Morley) presided, and amongst others present were the Lord Mayor of Leeds (Sir Edwin Airey), Mr. J. Alfred Gotch (President of the R.I.B.A.), Mr. Lascelles Abercrombie, M.A. (Professor of English Language and Literature at Leeds University), Mr. A. Hamilton Thompson, M.A., D.Litt., F.S.A. (Reader in Mediæval History at the Leeds University), Mr. C. H. Reilly, M.A. (Professor of Architecture at Liverpool University), Mr. H. S. Chorley, M.A., F.R.I.B.A., Mr. W. Alban Jones and Mr. T. H. Foggitt (Vice-Presidents of the Leeds and West Yorks' Architectural Society), Mr. W. Whitehead (Treasurer), Mr. F. L. Charlton (Secretary), Mr. J. C. Procter, Mr. T. Butler Wilson, and Mr. W. J. Turnbull.

Mr. H. S. Chorley, in proposing the toast of "The City of Leeds," said Leeds was at the present time, with the one exception of Liverpool, the best of any city as regards housing schemes. Leeds was also a pioneer in the matter of arterial roads and the development of suburbs, and also had one of the largest schemes in existence for the wiping out of slums. This progress was mainly due to the fact that there were in the city a large number of public men who were prepared to give up their time to the city's welfare.

The Lord Mayor, in responding, said architects were very great idealists, and like most idealists they were very expensive luxuries. They outlined for the ordinary layman the beauties of buildings, which, if they were erected, would be an unceasing joy. These, however, could not be obtained; first, because of the great cost of building; second, because of the lack of support from the would-be owners; and, third, because of the great demand for utility rather than for beauty. The general public needed educating to the value of architecture and its services. They were living in times of great publicity, and it would be to the advantage of the community in general if architects undertook some form of publicity in the shape, for example, of lectures. He would like to remind them that many of their ideals would not be possible but for the builder—the hewers of wood and the drawers of water. Slum property was still wrongly looked upon as a necessity in industrial centres. Mean streets and mean houses meant men, women and children were neglected. If they could only do something to improve the industrial centres it would have the effect of allowing people to live better and purer lives. He wished that the architectural profession might prosper as it so thoroughly deserved.

Mr. Lascelles Abercrombie, in proposing the toast, "The Literature of Architecture," said that he felt that literature had a certain unfair advantage in all such topics as these, for the people who practised the other arts, when they desired to explain themselves, or to draw attention to themselves, could do nothing else but call in the art of literature. Yet the art of literature had been less than fair to the art of architecture. There was a tendency among novelists to make the architect slide almost imperceptibly into the villain. That was probably an attempt on the part of the public to get back at the architect for some of the things from which they had suffered, and for which they quite ignorantly blamed the architect. It was undoubtedly less than grateful on the part of literature not to take that high view of the art of architecture. Literature, of all the arts, was the one which must always realise the value of civilisation, the one thing which perhaps made life worth living. Civilisation could not exist without town life, which was the instrument of civilisation, and it was architects who provided town life with its embodiment. And there was another reason. As a provincial he, of course, looked upon London as a place where provincials went to spend their money, but that was not the way in which London regarded the provinces. There was no reason why London should be regarded exclusively as the cultural capital. If we looked back in history, we found that towns half the size of Leeds, towns such as Athens and Florence, had been centres and capitals of culture, because they were entirely self-sufficient and self-reliant. That was what our English provincial towns should be. What was required was confidence in their powers of culture and of civilisation. Architects had long ago realised that their interests lay in the home town, and that they did not need to rely on the culture of the capital. It would be a good thing for the life of England when the members of the other arts imitated the architects in forming such cultural centres as that which he saw before him.

Mr. Gotch, in reply, having referred to the growing influence of the provinces in the affairs of the Institute, said that of all the great arts literature and architecture seemed to him to be the most widely divorced. The fact was that the great writers who had obtained the ear of the world had had little or no acquaintance with architecture. They had no other knowledge of it than enabled them to touch upon its fringes and outskirts. No one who had not been trained in the mysteries and detail of architecture could ever hope to deal with it in literature with success. Architecture hardly ever appeared in the poets, or, if it did, it was in but a fleeting manner. Chaucer, Spenser, Shakespeare, Milton and Gray all referred to architecture, but their descriptions were not written from the architectural point of view. In the writings of Ruskin there was a very intimate connection with architecture, but what architect who knew his Ruskin would describe him as a guide to the profession? He appealed to the emotions, and he had stirred in the public mind feelings which would be of benefit in that they would have opened the eyes of the public to the beauty that laid in architecture. But he was an unsafe guide because he had had no architectural training. To write a poem on architecture it was necessary to be fully versed in the history of its nature and in the logic of its construction. Perhaps some genius might still arise who, proved as an architect, might in the intervals give to the world glowing pictures of architecture full of colour and movement and full of truth.

Professor Reilly, in proposing the toast, "Architecture Pure and Undefiled," said that he had the greatest faith in the future of the profession because the education of architects was now being taken seriously. This would make a new post-war architecture which would be secured by the straight-forward answering of problems which would be in a sense undefiled, because it would be carried out in a spirit which was pure and undefiled. He thought that they should make their own centres independent of London. In towns like Leeds they could do extraordinary things in architecture, as they could in other arts.

Mr. Foggitt, in responding, said that he thought the ideal of architecture pure and undefiled was being realised bit by bit. Social progress during the past two or three years had been great, and at the same time the progress of architecture had been great also. With regard to housing schemes, he thought that there was a tendency to try and do something better than had been done before. The ideals with which the proposals for the housing schemes had been begun were great ideals, and the programme was a great programme. The attainment of some of those ideals had been found impossible, but the fact remained that there had been an effort made for better things, and that was a great step forward. Before we had had indifference and now we had a recognition that better things were desirable and some steps had been taken to gain those better things. In London there was now a realisation on the part of the public, more particularly among the great commercial and business houses, that architecture was, after all, something to be desired, and week by week buildings were being erected which had that qualification, and which were steps forward.

Professor Thompson, in proposing the toast of "The Architectural Profession," said that architects owed far more to the mediæval spirit than they were perhaps induced to realise. They had seen how possible it was to beautify the streets and squares of our modern towns and to take advantage of modern schemes in town planning in a spirit which turned upon tradition and at the same time was purely modern. He saw in architecture at the present time a really true and sincere carrying out of the spirit of the past, and architecture of to-day had a tremendous future before it.

Mr. Eric Morley, responding, said that the profession had been through some very hard times. The artificial spirit of the day had very nearly engulfed them in its inexorable tide of progress. The future held bright hope and there were two things on which they could count. The first was that the public was beginning to show a definite interest in their work, and the second was the progress that was being made in architectural education. These two facts meant that in the future an architect was not only going to have the pleasure of working for a discriminating public, but that he was going to be trained for his job.

Responding to the toast of "The Guests," which was proposed by Mr. T. Butler Wilson, Mr. W. J. Turnbull said he would like to draw the attention of architects to the great strides which had been made in the housing of the people under the direction of the Leeds architects. In the matter of lay-out, the excellence of the houses to-day was due largely to the efforts which architects had put forth.

THE LAW RELATING TO BUILDING.

By W. T. CRESWELL, Lic.R.I.B.A., F.R.S.I. (*Barrister-at-Law*).

V.—POSITION OF ARCHITECT UNDER THE CONTRACT AND TOWARDS THE CONTRACTOR.

After his plans have been approved by the employer the architect has no authority to invite tenders until he has the instructions of the employer to do so. Up to this stage he is merely a "skilled draughtsman." It follows that he can only claim remuneration as such until he has been instructed to superintend the works as agent of the employer. Further, even after the instructions of the employer to obtain tenders, and the receipt of any tender at or near the estimated price agreeable to the employer, the architect has no authority to enter into any contract for the work (see Hamer *v.* Sharp (1874), L.R. 19 Eq. 108).

After a contract has been duly entered into, the contractor is entitled to recover for all work done under the architect's or surveyor's orders, though such work may exceed the employer's limit; unless the contractor has been definitely informed of the employer's limit; if he has not, after payment has been made to the contractor, the employer may recover any loss from the architect or surveyor due to his having allowed the contractor to exceed the limit previously given him by the employer.

When once the architect or surveyor has taken over the superintendence on the employer's behalf, the contractor must obey all instructions of the architect or surveyor, even if he considers them unreasonable; there is no implied contract or warranty on the part of the employer that the architect or surveyor will only give such instructions as are reasonable (see Jones *v.* St. John's College, Oxford (1870), L.R. 6, Q.B. 115).

Nor can the architect or surveyor dismiss the contractor unless specially empowered by the contract to do so. Since the employer cannot be bound by orders or representations on the part of the architect or surveyor varying the contract, it is useless for the contractor when called into question to plead in reference to variations or alterations that the architect or surveyor represented to him that the contract must be varied either as to design or materials used, or that certain terms of the contract would be waived. In general, the limit of the powers and authority of the architect and surveyor should be such as is clearly defined in the written contract.

Architect's authority to employ a Quantity Surveyor.

Usually an architect employs a quantity surveyor to prepare bills of quantities for proposed works, if they are, in his opinion, of sufficient dimensions to render it obviously necessary that the builders in tendering should have this aid to giving a satisfactory estimate of cost. This authority, therefore, becomes an implied authority, in the case of larger undertakings, when he has been instructed to obtain tenders—but in general he should see to it that he has express authority—and more especially for smaller buildings—before calling in a quantity surveyor. The custom of architects employing quantity surveyors has been recognised in the English Courts, but does not appear to have been so recognised in the Irish or Scottish Courts.

It follows that an architect has no authority to prepare bills of quantities himself unless by the instructions of the employer; although it has been held (see Lansdowne *v.* Somerville (1862) 3 F. & F. 236) that where the architect and the employer are both familiar with the custom where it exists, then the architect has an authority. In the above case the judge left the following questions to the jury:—"Was there such a custom, and was it known to the parties, and did they contract on the footing of the custom?" The jury found affirmatively in each question, and judgment was as above. But in Antisell *v.* Doyle (1899) 2 I.R. 275 (where the quantity surveyor who had been instructed by the architect sued the employer for payment of his fees) the jury found that the employment was neither within the scope of the architect's authority nor sanctioned by the defendant, and that no custom exists sanctioning the architect's action; the majority of the judges stating that the alleged custom could not be relied upon as generally practised.

It follows also that if the lowest tender received by the architect exceeds the employer's limit, he has no authority, without the consent of the employer, to employ the quantity surveyor to adjust his bills of quantities to tally with any alterations or variations of plans, designs, etc., which have been made with the consent of the employer in order to bring the cost down to his limit. Especially as, knowing the employer's limit, the architect himself is responsible for not keeping his design within that limit. Further, the architect must have the employer's instructions before employing a quantity surveyor to measure up deviations in the works; especially if he himself is designated in the contract as the person to settle the accounts at conclusion—but, again, custom has been successfully pleaded where large and extensive measurements were involved.

If the employer should question any certificate granted by the architect, the latter may suggest that a quantity surveyor be employed to measure up the work; and, if the employer agrees, he is, of course, to be charged with the surveyor's fees. However, if the architect calls in the quantity surveyor without first obtaining the consent of the employer, then he is himself chargeable. In all cases, however, where the employer is informed that quantities have been prepared, and he ratifies the employment by acquiescence, he cannot maintain an objection to pay the fees of the quantity surveyor on the plea that the architect had no authority to employ him.

Amphitheatre (in marble) of the Arlington National Cemetery, Washington, U.S.A.

R.I.B.A. MINUTES.

We take the following notes from the Minutes of the Council Meeting, held on January 21:—

The Royal Scottish Academy.—The congratulations of the Council were conveyed to Mr. George Washington Browne on his election as President of the Royal Scottish Academy.

Smoke Abatement.—It was decided to make representations to the London County Council on the subject of smoke abatement in London.

Royal Sanitary Institute.—Mr. H. D. Searles-Wood, F.R.I.B.A., was appointed to represent the R.I.B.A. at the Annual Congress of the Royal Sanitary Institute, to be held at Liverpool in July.

Shortage of Skilled Labour in the Building Industry.—Professor S. D. Adshead and Mr. W. Alexander Harvey were appointed as additional representatives of the R.I.B.A. on the Conference which has been arranged to consider this question.

The Letting of Office and other Accommodation.—The following resolution was passed and ordered to be published in the R.I.B.A. *Journal*:—

"The Council view with disapproval the exhibition by architects of boards upon which are displayed notices that offices or like accommodation are to be let and that applications to the architects are invited. This resolution does not preclude the architect of a building, at the request of his client, from exhibiting a board inviting prospective tenants to inspect the plans at his offices, provided that the architect receives no commission for lettings resulting, nor does it apply to the letting or selling of land."

R.I.B.A. Scale of Charges: Clause 5.—It was decided to publish a note in several successive numbers of the *Journal* warning Members and Licentiates that they should, with reference to the above clause, protect themselves against the contingency of the work being subsequently proceeded with.

Sessional Papers.—Mr. Hope Bagenal, having found it necessary to postpone the delivery of his lecture on "Planning for Musical Requirements," on March 17, Major Harry Barnes was invited by the Council to deliver a lecture on "National Housing" on that date.

MEETINGS.

Friday, *February* 8.

Town-Planning Institute. — Discussion on "Streets." At 92, Victoria-street, S.W.1. 6 p.m.

London Society.—Mr. C. B. Levita on "Slum Areas in London." At John-street, W.C.2. 5 p.m.

Royal Institution.—Sir Arthur Evans on "Recent Lights on the Minoan Art of Crete." At 21, Albemarle-street, W.1. 9 p.m.

Monday, *February* 11.

Surveyors' Institution.—Mr. J. J. Dove on "Approximate Estimates for the Development of Building Land"; Mr. A. Paull on "Approximate Estimates." At 12, Great George-street, S.W.1. 8 p.m.

Wednesday, *February* 13.

Royal Society of Arts.—Mr. H. Maxwell-Lefroy on "The Preservation of Timber Roofs from the Death-Watch Beetle." At John-street, W.C.2. 8 p.m.

L.C.C Central School of Arts and Crafts.—Sir Banister Fletcher on "Ancient Architecture: Theatres, Amphitheatres and Circuses." At Southampton-row, W.C.2. 6 p.m.

Thursday, *February* 14.

Society of Antiquaries.—Mr. C. R. Peers on "Sculptured and Inscribed Stones from Lindisfarne." At Burlington House, W.1.

Edinburgh Architectural Association.—Mr. L. M. Tye on "Illuminating Engineering." At 15, Rutland-square. 8 p.m.

ILLUSTRATIONS.

The British Empire Exhibition.

In this issue we give a number of illustrations of the reinforced concrete buildings now completed or nearing completion at Wembley, from the designs of Messrs. J. W. Simpson and Maxwell Ayrton, FF.R.I.B.A.

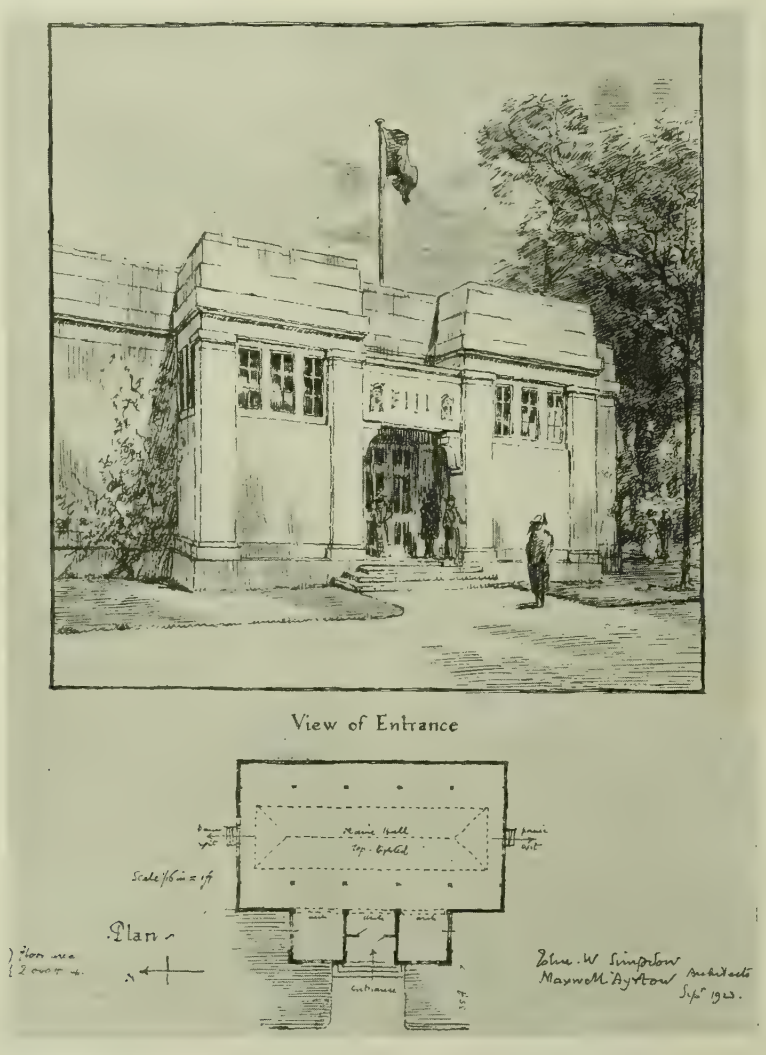
The combination of social jollity with personal improvement such as Chaucer has depicted for us in his immortal Canterbury Tales, where the dual aspects of the pilgrimage are set forth with the holiday spirit in greatest prominence, applies also to the exhibitions of these modern times.

Instruction is joined to relaxation rather than to the coercive discipline of school or office routine. The visitor is invited to enjoy himself and look about him in surroundings that present sufficient of the elements of both novelty and order to awaken thought and stimulate a flow of ideas.

It is in this fashion that the British Empire Exhibition at Wembley has been designed. Fun and frolic, scenic railways, and the rest are proper accompaniments to the more serious exhibits, and provide a common meeting place for persons whose normal tastes and activities lie miles apart from one another.

The facilities for enjoyment, for obtaining food and drink, and for reposeful methods of locomotion are all being provided on an ample scale, and figure prominently in the handbook issued by the Executive Council of the Exhibition.

A great Exhibition, attracting pilgrims from all parts of the Dominions, also serves a serious purpose, but that purpose would fail of fulfilment in the absence of good will and an amiable temper in all concerned. If this sunny outlook can be maintained, the wonders displayed in the several gigantic buildings will be inspected to the best advantage, and certainly some very interesting features will be present.



The enormous size of some of the buildings will undoubtedly receive attention. "The Australian Pavilion is as big as the whole of Olympia," the Australian contribution to the Exhibition being valued at £200,000, and the space covered 5¾ acres.

"These exhibits" (to quote the handbook) "taken in their entirety, will bring home to the visitor the enormous wealth of the Empire, the immense strides being made overseas in the development of both agriculture and manufactures, the ever-increasing facilities and attractions offered to the intending migrant, and the important part each State plays in making the Empire a rich, powerful, and indivisible whole."

The Palace of Engineering and the Palace of Industry each cover very much greater space than the Australian exhibit, and their contents will be housed in the finest and largest buildings ever erected for the purposes of a self-contained exhibition. It will be instructive to ascertain, when the Exhibition is open and thronged with visitors, whether the effect of great dimensions produces the effect of great scale, or whether, as in so many gigantic buildings, mere size counts for little after it has exceeded a certain maximum.

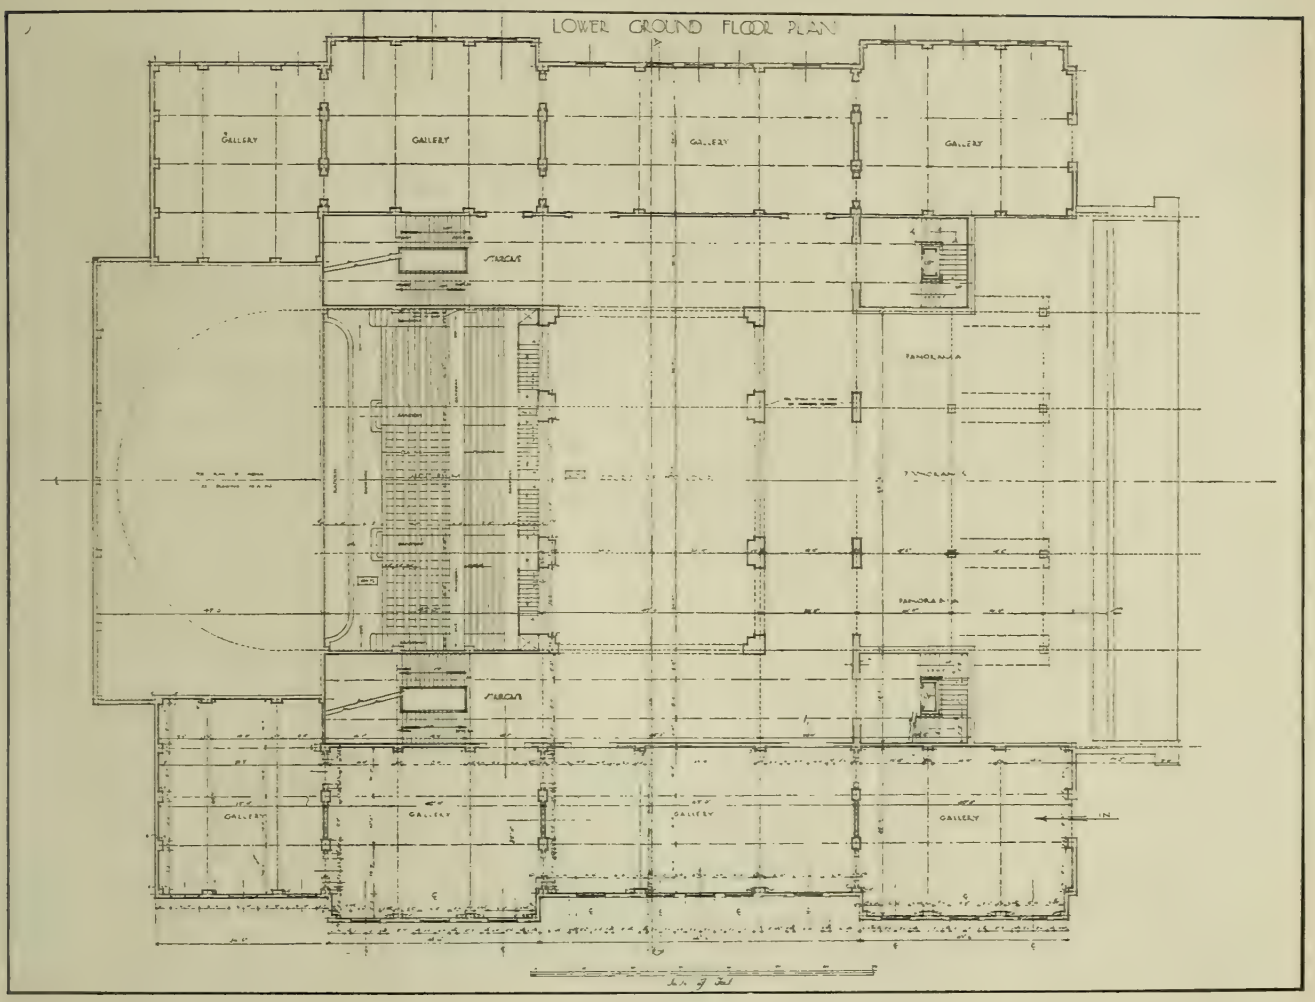
The great space is, however, divided among exhibitors who require in some cases as much as 4,000 to 8,000 square feet for their stands, so that it may be taken that the great size of the building is founded upon practical requirements. Small things, as well as great, will be on show, and it is proposed to set up the Queen's Dolls' House, to which so many notable artists and craftsmen have contributed of their best.

The antiquarian flavour of British art today will find its echo in the series of rooms decorated and furnished in the styles characteristic of the years 1750, 1815, 1852, and 1888. The two last of these coming in the hitherto despised Victorian period, it may be questioned whether any revulsion of feeling in its favour will be established. The arts of the period found substantial approval and support in their own day, and it would be a whimsical overthrow of a deep-rooted prejudice were the Victorian style to return to favour now.

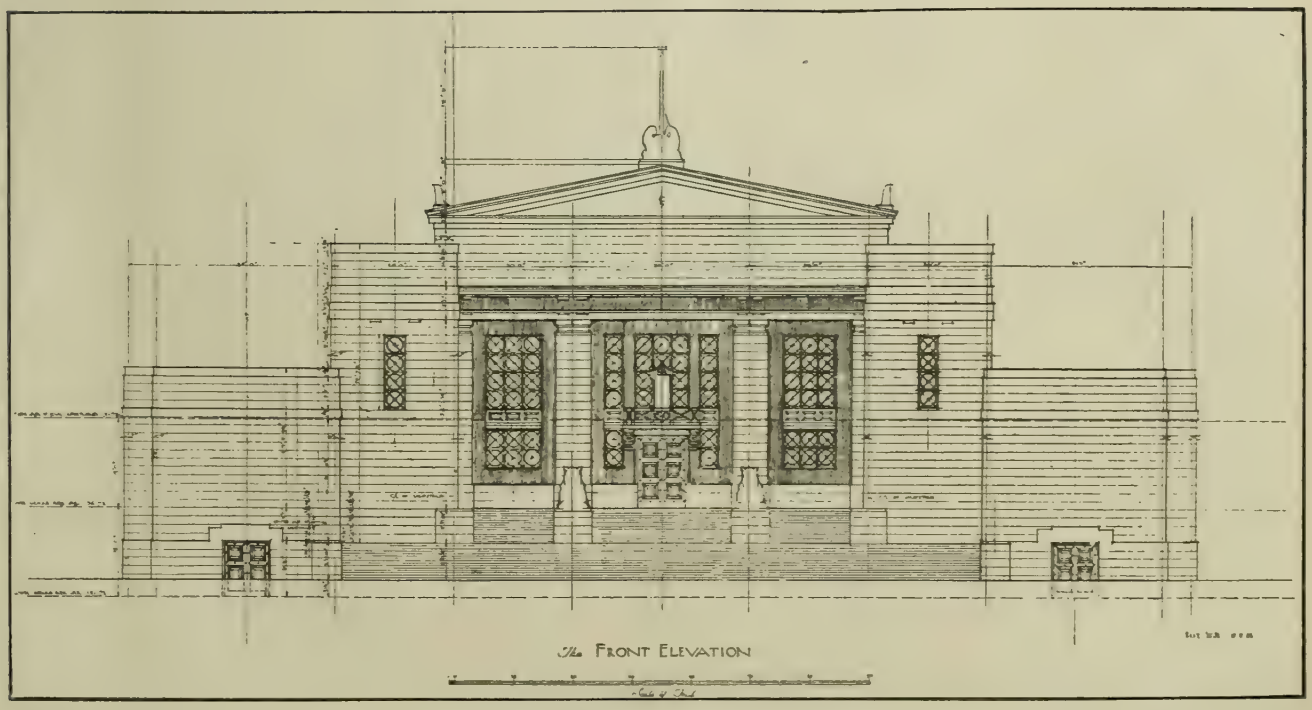
Entrance to British Empire Exhibition.
Messrs. J. W. Simpson & Maxwell Ayrton, FF.R.I.B.A., Architects.

"Natsopa House."

This building, at the corner of Blackfriars-road and Meymott-street, London, S.E. 1, is designed as an office building for the London Branch of the National Society of Operative Printers and Assistants, and is, as the drawing suggests, to show hand-made bricks and stone facings over the steel framework.



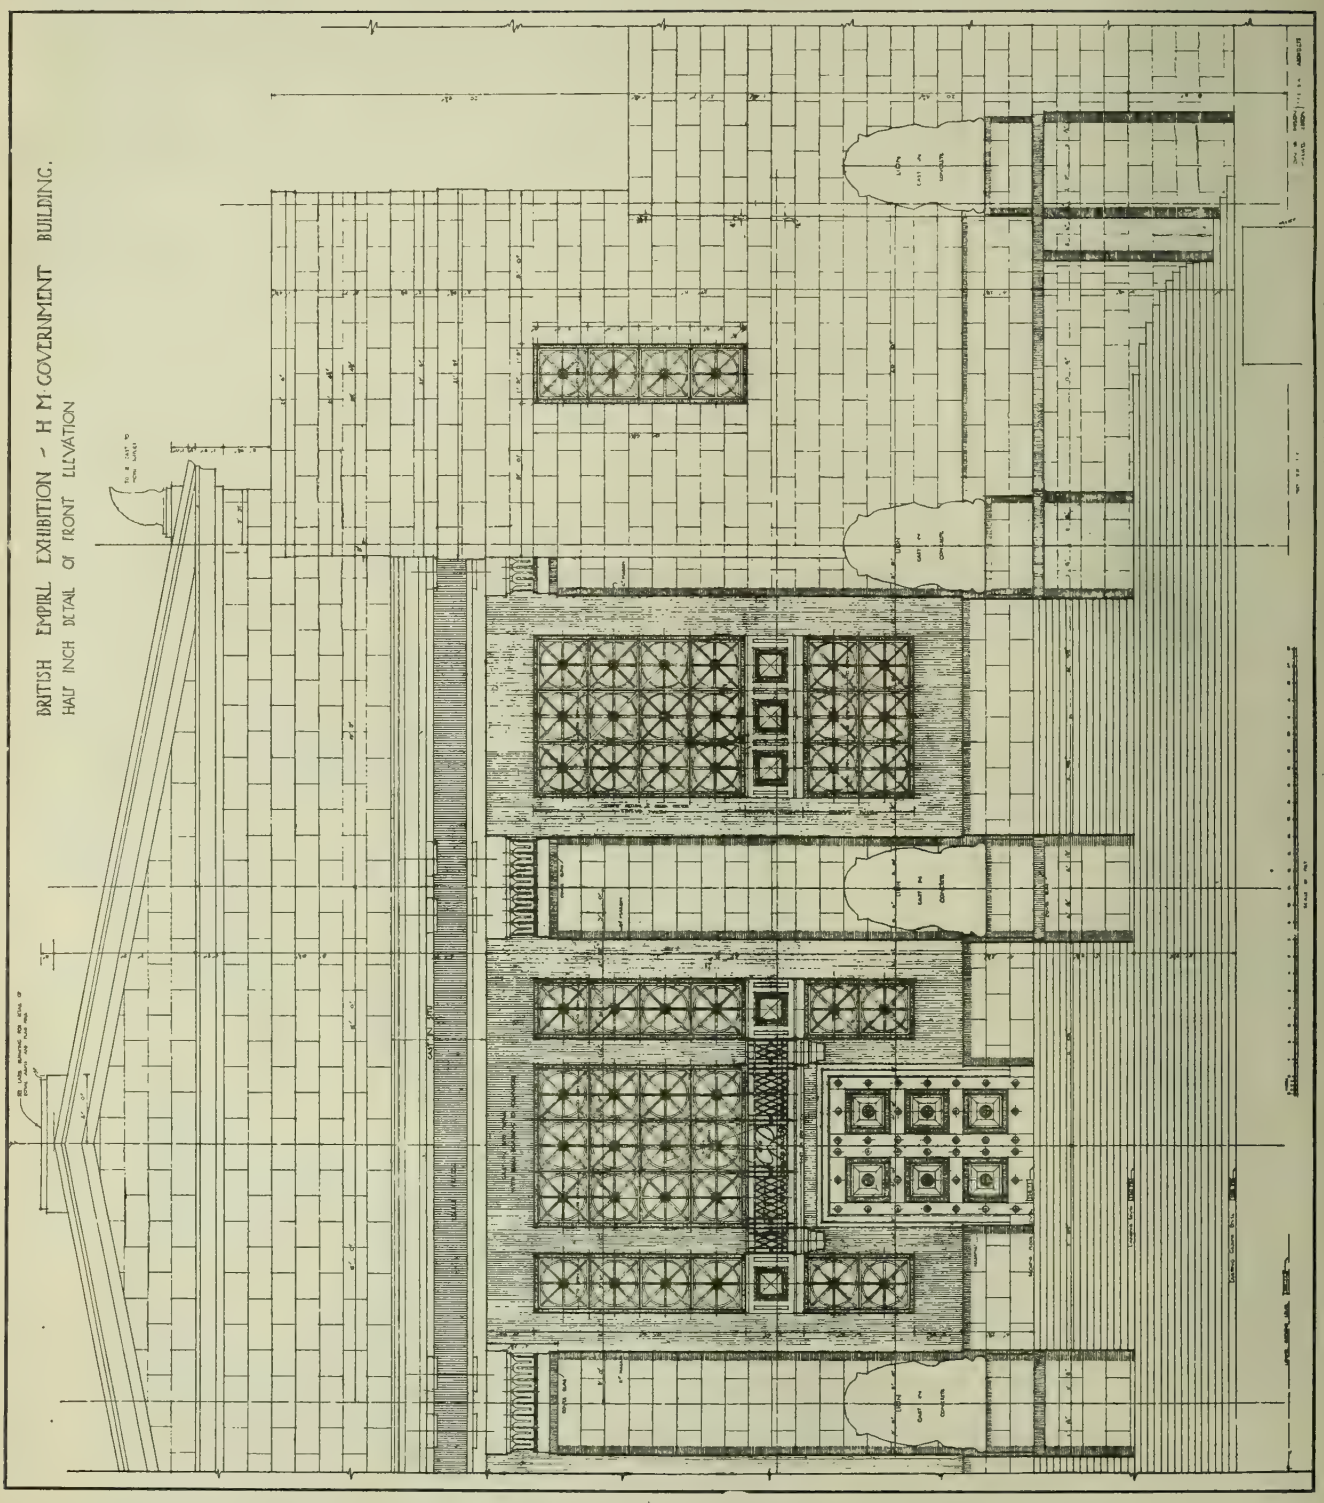
Messrs. Harding & Williams, of Leicester, are the architects, and the contractors are Messrs. Arthur Vigor, Ltd., 20, Knightsbridge, S.W. 1. The sub-contractors include: Williams, Gamon & Co., steel casements; Porcelain Tile Co., tile work; Carter & Co., terazzo work; Engert & Rolfe, Ltd., asphalting; John Ellis & Sons, Ltd., stone work and staircases; Haywards, Ltd., patent area and lantern lights; Archibald D. Dawnay & Sons, Ltd., steelwork; Hollis Bros. & Co., Ltd., wood block floors; Siegwart Fireproof Floor Co., Ltd., patent floors; Doulton & Co., Ltd., sanitary fittings; Mr. C. H. Kenney is the clerk of works.



Housing Scheme at Purley.

We illustrate on p. 223 a housing scheme, to be carried out by private enterprise, on the Roke Farm Estate, Purley. The scheme, which comprises 63 houses in all, has been approved by the local authorities and also by the Ministry of Health, and complies with the "private enterprise" provisions of the Housing, &c., Act, 1923 (which was fully reviewed in our issue for August 24, 1923).

Subject to certain conditions the houses will be eligible for a subsidy of £75 each. The superficial area of each cottage is limited to 800 ft. The accommodation comprises a living room, scullery (or working kitchen) on ground floor; three bedrooms, bathroom, and separate w.c. on first floor. The cottages are to be built in groups of two, three, four and five; and the exterior design will be varied to avoid monotony. The lay-out of the site provides for access to the gardens from passageways at the back.



The architect is Mr. Chas. E. Hanscomb, F.R.I.B.A., of Station-approach, Sanderstead. The builder is Mr. J. P. Oldaker, of Purley.

ECONOMY IN BUILDING CONSTRUCTION.-I.

HINTS FROM AMERICAN METHODS.

By "THE JOURNEYMAN ARCHITECT."

IN the issue of *The Builder* of January 4th there appeared a letter from Mr. A. C. Shayler, of Ontario, Canada, that was very much to the point. Mr. Shayler hopes that "in time it will be discovered that there are methods of building comfortable and permanent houses other than all brick," and thinks "that those who are in authority and have to do with unemployment and housing shortage would do well to realise it."

It is an excellent letter, and by no means the least impressive feature of it is that it is not meant to be sarcastic. It is full of sound common sense advice, evidently gained first hand, and quite as evidently offered by one somewhat removed from our more conservative home atmosphere. In Canada and the United States, to advance an idea that is evidently practical and common sense is quite sufficient reason to gain a hearing. But with us there are many forms to be observed before this happy consummation is reached.

Here it may not be out of place to make reference also to the source of much that today passes for knowledge of America and things American. To have spent a month or so in being fêted in the main cities of the Eastern States and to have viewed the intervening countryside from the windows of a Pullman car seems to be accepted as quite sufficient justification for lecturing with authority upon the entire American continent, nationality, and customs. Nothing could be more erroneous, nor better devised to give the wrong impression. For whilst nothing pleases the American more than to fête the foreigner, especially if he comes to them as an accepted "big gun"—and in so far as the practice gives vent for the American love of excess it may be taken as indicative of American character—yet it is a vastly different thing to work by the side of the American and in competition with him. Only this way can one learn and appreciate the American. To travel from the Atlantic to the Pacific, working one's way from city to city with no more capital than a kindly Nature may have furnished and the drawing instruments customary to the class, is to be at once the journeyman architect, and to gain a knowledge of American methods that is real. To one who has worked in such a manner may be accorded the right to speak from first-hand knowledge.

The suggestion contained in the letter quoted—that timber construction should be introduced into England—is an excellent one; though perhaps to speak of the method as a revival would be the more correct definition, for timber construction is no new thing in England; nor, to be accurate, is the suggestion new. It is sometimes said that timber cannot be obtained at a price to render timber-built houses an economic possibility. This, in so far as timber from our main pre-war source—the Baltic—is concerned, is no doubt true for the time being. It is also true that the Canadians were accustomed to export their first quality brands. But what of the timber which they kept to use themselves in their cheaper class building—their third and fourth qualities? It has been said that the timber period is passed; that the supply is exhausted. Let me make the following imaginary comparison:—England and Scotland together could be comfortably dropped in the Canadian lakes and lost sight of. The Provinces of Quebec, Ontario, British Columbia, and part of Alberta, are each over three times the size of the Canadian lakes. Comprehensive surveys have been completed only for the Provinces of Nova Scotia and British Columbia—an inventory of the forest resources of Ontario is being completed, and extensive areas of forest land have been examined in the three prairie Provinces; but the information is still incomplete as to the total resources of these Provinces. For several years a thorough survey of the Crown lands of New Brunswick has been in process, and about 60 per cent. of these lands have been covered. As yet, only a relatively small portion of the forest area of Quebec has been reported on. Approximately one quarter of the land area of Canada is forest land, being 950,000 square miles, less than half of this carrying timber of merchantable size at the present time, and about one quarter carrying timber of 10 in. in diameter.

The table from the Forestry Report of the Department of the Interior of Canada given below shows the estimated stand of timber of merchantable size in Canada by regions:—

FIG. 1.—HOUSE IN BRITISH COLUMBIA.

Of the more Northern Provinces, perhaps no man knows the timber resources exactly, and certainly few can realise the immensity thereof. Perhaps the nearest that can be got to it is to think of all the thousands of acres one's mind is capable of picturing, and then write down a few more thousand on a piece of paper, for Canada's forests are estimated to contain eight hundred billion feet of commercial timber and one billion cords of pulp wood. And all that is required is sufficient timber to build a few thousand houses on a very small portion of a country that could be dropped out of sight in the Canadian lakes! Clearly there will be no shortage of timber until long after our needs are satisfied. It is not suggested that the adoption of timber construction should be anything more than a temporary measure to meet the need of the time though, indeed, to one who has lived in a timber-framed house, there will be evident many advantages. What is maintained is the proposition that if this form of construction be revived in England, and the framework and fittings be put together in the manner prevalent in the erection of the cheaper class of house in Canada and the States, then it will be found that the resultant house is an economic possibility, and one that will certainly endure for a time sufficiently long to see us past our period of need.

FIG. 2.—SQUARE COTTAGE ON A RAISED BASEMENT.

It is possible that the details of construction may be looked upon as somewhat elementary—so they are. Elementary, rough and ready, even retrogressive; but does it matter so long as we get out houses? The type of construction referred to is that seen in the cheaper houses of the Western States, and it is possible that for overcoming a temporary difficulty and supplying a temporary need, a good deal may be learned by studying the methods of those who regard their residences much in the light of a temporary resting place than as a permanent abode. Also, when consideration is given to this it may appear that our domestic condition is becoming in some ways more like that of the American than it used to be. For instance, there is the domestic servant problem, or rather there is no longer any problem for some of us for there are no domestics. In this we are on all fours with the American. The middle-class Americans in the West do their own domestic work. It is only the rich have "help," and that Chinese,

who do not live in the house. The effect that this must have and does have upon the plan will be readily agreed; and to learn of the most suitably designed house for the saving of domestic work it would be difficult to find a better subject for study than the houses of those who do their own.

This is the pith of the whole matter, and the reason for the raised ground floor and semi-basement; and not, as is sometimes stated, the climate. For in many parts of the Eastern and Southern States, the older houses built when slave labour was obtainable have no basements. The origin of the basement is the saving of domestic work. The central hot-air furnace or boiler therein renders possible the doing without fireplaces; and everyone who has ever had anything to do with house-work knows for how much of it fires are responsible. By the introduction of a central furnace or boiler the housewife is saved from all connection with any fire except the kitchen range, and that not the tremendous affair we are cursed with in England. The man of the house attends, and only twice daily, to the furnace. That the central furnace is responsible for a considerable amount of dust is acknowledged; but this need not be so. With the system in vogue of open gratings to admit the heated air direct into the rooms, and with these gratings placed in the floors, also with the cold air intake from the outside on the ground level, a certain amount of dust is unavoidable. But it would be no difficult matter to place the gratings above the floor level, and to filter both the cold air at its intake and also the hot air at its exit in such a manner as would prevent most if not all dust. The dust, too, from a furnace mostly gathers in light fluffy balls which may be easily swept up, and is not like the dust from coal-ash, which settles well into and upon everything inside the room.

Hot-air furnaces, it is true, have been in this country made somewhat upon the lines of those in use in Canada and the States; but they were not readily taken up, though how far prejudice and how far the unadaptability of brick and stone walls to the housing of air-ducts entered into this failure it would be difficult to say. But as in the present instance the innovation is suggested only for temporary wooden houses, the latter objection does not apply. Another item which would militate against the use of the hot-air furnace in small quantities would be the initial cost of their manufacture; but were these to be manufactured in sufficient numbers to supply the houses required, that feature would disappear. In a later article it is proposed to detail the system of heating by hot-air furnace, and to supply estimated figures of cost, as the method is an important point in the consideration of the production of an economic house, which does not mean only a house that can be built at an economic cost, but also one that can be lived in at an economic rate both of money and domestic labour; the last two matters being points often overlooked.

But its inclusion materially affects both plan and elevation; and here at the very outset is a point of contention. We have grown used to our comfortable-looking cottages which nestle upon the ground, and we will have nothing to do with those perched-up affairs mounted upon a semi-basement half in and half out of the ground. The point is recognised and must be

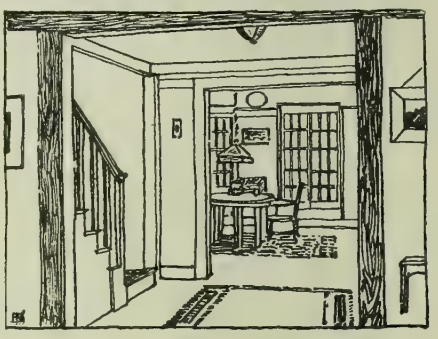

Fig. 4.—Effect Gained by Sliding Doors.

acknowledged to be a very decided detriment, architecturally, in the majority of American houses. The illustrations of a house in Victoria, B.C., and the small bungalow (Figs. 1 and 2) show this, like everything else in design, is a matter of proportion, and the basement need not of necessity be the cause of lack of proportion. A sloping site may be turned to advantage in the matter of the basement, and the square bungalow shows a type of the most economical of plans suited to the flattest of sites.

In the disposition of the rooms it is again the domestic service matter which controls the situation. The American desires to have things handy—a very natural desire when one has to fetch things for oneself. The kitchen must be handy to the dining-room if it be not the same, and the living-room may well be the hall. The effect of this is at once seen in the elevation in a compactness due to lack of disconnecting passages, and the result is a saving on the total cost, for the square plan is generally the most inexpensive to build, and the type adopted utilises space often wasted in hall and passages, as may be seen from the accompanying plan (fig. 3). Another feature having an effect both upon plan and cost is the sliding door between living-room, dining-room, and hall, where there is one (fig. 4). By this means is achieved economically a floor space, which space upon occasion may be quite large, but which may be subdivided into separate rooms, small but sufficiently spacious for the needs.

The added convenience of the service pantry interposed between the kitchen and dining-room is easily seen from fig. 5, and the saving of plumbing work is a matter of measurement. From this figure also may be gathered how, with knowledge, the American type of plan and construction may be made to suit our needs most advantageously.

Hofburg Extensions.

We understand that the scheme to place shop windows in the tunnel passage under the more ancient portion of the Hofburg is to be supplemented by a proposal to lease the entire ground floor, completed though unfurnished, of the new wing of the Palace (built as a residence for the Archduke Rudolf), as a restaurant with cafes and patisseries. While other portions of the wing are to house paintings and natural history objects which cannot find room elsewhere, the reception galleries of the upper stories are to be thrown open as reading halls and, in part, as extensions of the National Library.

The Roll of the R.A.M.C.

At the Victoria and Albert Museum (Room 72) may be seen the memorial roll of the four thousand odd officers and men of the Royal Army Medical Corps who gave their lives in the Great War. These 270 pages of lambskin contain in alphabetical order the names of them all, with rank, honours, and date of death; and they will be bound and deposited in the Chapter House of Westminster Abbey. Already there is a tablet to these men of the R.A.M.C. in the Abbey.

The roll was designed by Mr. Graily Hewitt, and was carried out by him and six assistants. Mr. Horace Higgins did practically all of the writing of the names, in black, with their honours in gold and the dates in red, the script being based by Mr. Hewitt on Italian fifteenth century, the main source of our modern printing types. At the head of each division by letter comes a sentence from the parable of the Good Samaritan, into the initial of which Mr. Reco Capey has painted a scene from the story. Opposite the title-page is painted a larger scene from the same parable, and below it is a figure of St. Luke, the beloved physician and artist, with his symbol, the ox. Next to the preface is a painted bust of Æsculapius, copied from the bust in the British Museum, set amid a vine.

THE ARCHITECTS' AND BUILDERS' INQUIRY BUREAU.

Hot-Water Circulation Pipes.

SIR,—Your correspondent, "Student," should have no difficulty at all with his cylinder in the bathroom provided he runs his pipes on the correct modern method and puts his cylinder at a level higher than the door in question. It would not be worth while putting the cylinder on the floor of the bathroom owing to the difficulty of venting the pipes and the tremendous loss of heat. Why not put the cylinder in the kitchen in the ordinary way, enclosing and lagging it, and saving large expense? And why does he not buy Mr. Dye's excellent little book on "Domestic Hot Water"?

JOHN HIPKIN.

Poplar.

SIR,—"Student" must know that the whole principle of hot-water circulation is bound up in the rules of convection.

A body of water, if heated at the bottom, is set into circulation throughout its whole bulk owing to the rarified hot-water being replaced by the gravity of the denser cold water, and in turn as it cools to be replaced by other heated water. The hot water rises to the highest point it can reach uninterruptedly, and no further, falling again as it cools.

It is, therefore, necessary in any heating system or hot-water supply to allow for a continual unchecked rise to the highest point of the system and a further unchecked fall back to the source of heat. If this rule is transgressed without calling in the expensive aid of a force pump, the result is stagnation and failure as a system.

"Student's" door should not, however, prove an insuperable obstacle, even in a bungalow, though it is difficult to say definitely without seeing the plan and hearing all the facts of the case.

Surely the cylinder can be raised up sufficiently high to allow the adequate rise and fall between boiler and cylinder *over* the door. The rise and fall of the circulating pipes can then be arranged in the roof space, the pipes being well insulated and the supply points being served with as short "dead legs" as possible.

It is difficult to believe that the case in point cannot be designed to work admirably in some such fashion as this, unless I have entirely misunderstood "Student's" difficulty.

"READER."

Treatment of Oak.

SIR,—We shall be glad to know what is the best treatment for oak used externally in order to obtain the silver-grey effect common to old, weathered oak.

"ARCHITECTS."

Heating and Hot Water Supply.

SIR,—I am erecting a bungalow heated entirely by radiators, and am anxious to adopt a satisfactory system by which one small furnace and boiler will serve the heating system and hot water supply. I am aware of the objections to continual change of water in a heating system leading to the furring up of the pipes in time, and have examined several boilers in which a double jacket separates the water for the two purposes, but they are all too costly for my purpose.

Can any of your readers advise me of a method of treating the pipes in an inexpensive manner to solve the problem?

"LABOUR SAVER."

Smuts from Chimneys.

SIR,—The occupants of a two-story house (standing in its own grounds) erected 18 months ago, have been continuously inconvenienced by smuts descending externally from the chimneys and settling on window curtains and on all objects in the garden. The chimneys have 9 in. by 9 in. flues, and are carried up in roughcasted brickwork 2 ft. above the ridge of a fairly steeply pitched roof and have in addition 2 ft. pots. Good quality coal is burnt in the fireplaces and coke in the independent boiler. There are no hills or high trees anywhere near the building. Any suggestion as to the possible cause of the trouble or of a remedy would be very welcome.

"ARCHITECT."

Solid or Hollow Ground Floors.

SIR,—In your inquiry column of the 25th ult. the writer of the letter signed "N. B. H." says nine inches of concrete should be placed under ground floors; this is quite unusual and, I venture to say, unnecessary. I have put solid floors in cottages and have never heard any complaint about them and in all cases only 6 in. of cement concrete, including the top screed of coke breeze, was used.

Two points are of great importance: First, the damp course in the walls must be at least 3 in. below the floor level, or vertical damp-proofing will be required; second, the boards must be laid in a thick layer of tar, which must extend under the whole floor and must not be put down until the concrete is thoroughly dry.

I would like to draw special attention of those interested in this subject to the very dirty condition in which invariably the space under the joist floor on sleeper walls will be found to be.

D. A. FORSTER.

Weybridge.

Cost of Walls.

SIR,—In answer to "H. M. S.;" 2½ in. and 3 in. terra-cotta partition slabs cost about 3s. and 3s. 1d. per yard super respectively, and can be erected at a cost of about 6s. to 6s. 6d. per yard super at the present time according to the quotations of reputable contractors.

Brickwork at £30 per rod reduced works out at about 6s. 7½d. per yard of 4½ in. work, so that it would appear that there is little difference in cost in ordinary cases.

Where, however, such division walls do not occur directly over solid bearings terra-cotta, in common with other lighter materials, has its advantage over brickwork and without the faults of coke breeze or cement concrete, like undue expansion and contraction or a hard surface conducive to condensation.

A 4½ in. brick wall, 8 ft. high, brings a load of 8 cwts. per foot super upon its base, while a terra-cotta partition of the same height imposes only 5 cwts. per ft. super in spite of its narrower width.

Where such partitions occur near the bearing of a floor it is quite safe to erect them off a plate direct on the wood joists of an ordinary floor, and in floors designed to take a live load of 2½ cwts. per ft. they could be erected in any position without additional support.

To sum up, for ordinary work on solid supports there is not much cheaper material of a fire-resisting nature than 4½ in. brickwork for partition work, and it is not worth while disturbing the even flow of bricklaying by the introduction of another material.

For work not having solid supports, terra-cotta has a distinct advantage over brickwork in the saving to be effected in steelwork, either by its elimination or reduced weight.

I trust this will satisfactorily answer "H. M. S.'s" query. "SURVEYOR."

Building Costs.

A factory of four stories would cost about half of the same floor area in a one-story building. I could give proof. HENRY LOVEGROVE.

SIR,—A friend of mine who read the letter by "Essex," in last week's number of *The Builder*, remarked to me that this was the old controversy of bungalow *versus* two-storied house cropping up again. I had to disagree with him in that; while a firm advocate of the two-storied house on the score of economy, I am equally convinced that in factory work it is far wiser to spread out on one floor with the same end in view.

Cost of land or the lay-out of shafting may determine otherwise; but it is an undoubted fact that the expense of heavy suspended floors is out of all proportion to that of a light roof covering over a similar area. The great strains induced by vibration are also reduced to a minimum where the machinery has a solid bed on the ground, and I have little doubt that, given cheap land, the one-storied factory is the thing.

"GROUND FLOOR."

A Slating Problem.

SIR,—What is the best method of laying slates on a boarded and felted roof for a windy site; pitch of roof 30 deg.? Being boarded it is, of course, not possible to point from below with lime and hair mortar after laying. I do not want the slates to rattle and perhaps therefore work loose, but to be firm, and also well supported besides at the top and bottom edges. Owing to inevitable irregularities slates not pointed are often only leaning on diagonal corners. Some specify that the slates be bedded in lime and hair mortar as laid. I dislike this as I find it keeps the roof almost permanently damp, the mortar retaining the moisture so long. I have been thinking of specifying that two small dabs of oil putty be put below the nail holes as laid (centre nailed) and the slate pressed down on same. Oil putty being slow setting should find its exact bearing and make a secure job. Would there be any objection in practice to this? Is there, for instance, any question of expansion and contraction to be considered to any appreciable degree with regard to slating?

I do not think this extra cost of puttying should exceed 6d. per yard.

I consider putty should be better than Portland cement, for being slow to set it would adapt itself to the exact size required to fill up the space; it would not crumble or powder, and, finally, would not hold moisture. I should be very pleased to have other readers' opinions and also any practical slaters'. If the problem has been treated differently and successfully from this manner I should also be interested to learn how.

"MANCUNIAN."

Manchester.

Carpenters' Company Certificates.

SIR,—I am desirous of sitting for the certificate of the Carpenters' Company for building construction.

Would you kindly let me know when and where I can apply for particulars with regard to the above? F. G.

REPLY.

Examination in Carpentry and Joinery held in November, and Building Construction and Sanitation in November. Last year's syllabus is available, and answers to questions are issued for the use of candidates. You are advised to apply for further particulars to the Clerk of the Carpenters' Company, Carpenters' Hall, London Wall, E.C.

PRACTICAL DESIGN FOR BUILDING CONSTRUCTION—V.

AN ELEMENTARY EXPLANATION OF THE APPLICATION OF THE THEORY OF CONSTRUCTION TO PRACTICAL DESIGN.

By EWART S. ANDREWS, B.Sc., M.I.Struct.E., A.M.Inst.C.E.

SECTION I.—WALLS AND FOUNDATIONS (Continued).

Pressure on Base of a Reinforced Concrete Retaining Wall.

As a final numerical example upon the calculation of pressures on foundations, and one involving rather more complicated calculations than those which we have previously considered, we will take the case of a reinforced concrete retaining wall. This wall is illustrated in Fig. 8, and for the purposes of the calculation we may regard it as composed of the wall portion, A B C D, and the base portion, E F G H. The force tending to overturn the wall about the point H is the earth pressure P =9900 pounds, which acts horizontally in the line indicated. The forces tending to resist overturning are the following weights:—

(1) The weight of the wall portion, A B C D, acting through the centroid *a*, and equal to $17.75 \times 1.3 \times 144 = 3320$ pounds. (Reinforced concrete is taken as weighing 144 pounds per cubic foot.)

(2) The weight of the base portion, E F G H, acting through the centroid *b*, and equal to $10.5 \times 2.0 \times 144 = 3000$ pounds.

(3) The weight of earth, B C F J, taken at 110 pounds per cubic foot, acting through the centroid *c*, and equal to $18.3 \times 6.25 \times 110 = 12800$ pounds.

(4) The weight of the superload, B M J K, equivalent to 3.75 feet of earth, acting through the centroid and equal to $6.0 \times 3.75 \times 110 = 2480$.

Therefore the total stabilising weight *W* is equal to the sum of the above four weights, viz.:—

3320
3000
12800
2480

Total weight = *W* = 21600 pounds.

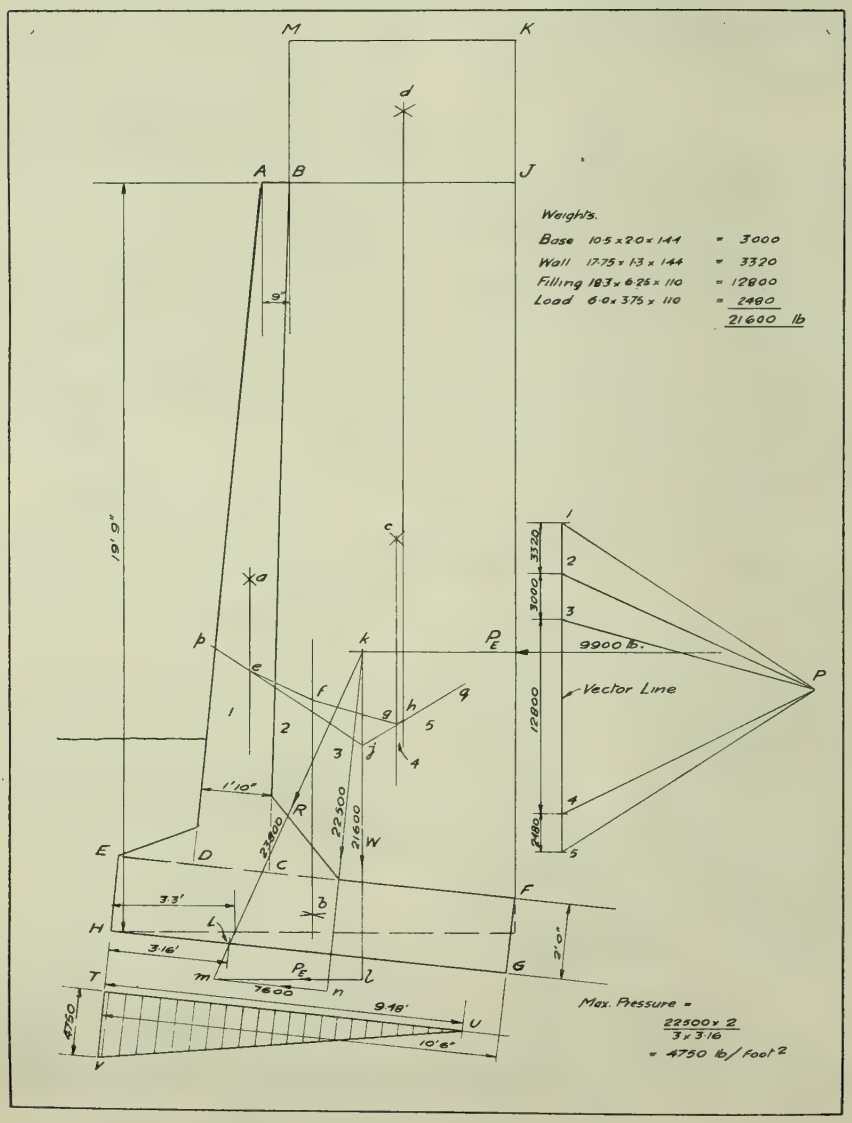

FIG. 8.

Graphical Construction for Position Line of Action of Total Weight.

We can find the position of the line of action of this total weight *W* by means of a graphical construction known as the link and vector polygon construction; this construction is the basis of the subject of graphic statics and will be employed in various forms in several of the problems yet to be considered.

We start by drawing verticals through the various centroids *a*, *b*, *c*, *d*, this giving the force lines, and we number the spaces between the force lines 1, 2, 3, 4, 5. This is often known as Bow's notation, and by means of it we designate a force line by the numbers of the spaces between which it comes; thus the first force line, the vertical through the point *a*, is called the line 1, 2; the next one through the point *b* being called 2, 3, and so on.

At some convenient point at the side of our diagram we draw a vector line parallel to the forces (vertical in our case), and to a convenient scale we set out lengths, 1, 2; 2, 3; 3, 4; 4, 5, to represent to scale the weight of the wall portion, A B C D, *i.e.*, 3320 pounds, and so on, as indicated on the figure. At some convenient place on one side of the vector line we then choose a "pole," *P*, and we join this pole to each of the points, 1, 2, 3, 4, 5 on the vector line. This pole can be chosen anywhere on either side of the vector line, and although the position of the pole affects the shape of the remainder of the diagram, it does not affect the result of the construction. The figure thus obtained by joining *P* to each of the points on the vector line is called the Vector Figure.

We now proceed to draw the link polygon, and start by drawing in space 1 a line *p e* parallel to P1, intersecting the first force line in the point *e*; we then draw a line *e f* across space 2 parallel to P 2, intersecting the second force line in *f*; then *f g*, across space 3 parallel to P 3. This construction is continued for every space, the line across the space being parallel to the line joining *P* to the point on the vector line bearing the same number as that of the space in question; these lines, *p e*, *e f*, etc., are called *links*, and the last link *h p* is parallel to the last "ray," P 5, of the vector figure.

In order to find a point on the face line of the resultant of all the weights we produce the first and last links, *p e*, *p h*, backwards until they intersect at the point *j*; we then know that the resultant load *W* passes through the point *j*. If we had taken our pole *P* at some other point our resulting link polygon would have been slightly different in shape, but the intersection of the first and last links would have come upon the same vertical line; if we had started our link polygon at some other point, the first link having been drawn anywhere across the first force line, the effect would have been to have shifted the whole link polygon vertically, but the result would have been the same.

We have now reduced the forces acting on the wall to two, viz., the resultant weight *W* and the horizontal earth pressure *P*E. To do this we first find the point *k* at which these two forces intersect, and we then set down to a convenient force scale a vertical line *k l* to represent *W* = 21600 pounds; we then draw *l m* horizontally to represent to the same scale *P*E = 9900 pounds, and by joining *k m* we find the resultant force *R* and the intersection of its line of action with the base *H G* gives us the load point *L*.

As the base *H G* is inclined to the horizontal we next have to find the components of the resultant *R* parallel to and at right angles or normal to the base. This is done by drawing *m n* parallel to the base, and *k n* at right angles to the base. On measuring *k n* to scale we find that it represents a normal pressure of 22500 pounds.

We are now in a position to calculate the maximum pressure on the soil and to draw the diagram of pressure on the soil. On scaling the length *H L* we find that it is 3.16 feet; this is less than one-third, and the load point, therefore, falls outside the middle

third, so that we have

Maximum pressure per square foot on soil

$$= \frac{2 \times \text{normal pressure}}{3\ H\ L}$$

$$= \frac{2 \times 22500}{3 \times 3.16}$$

$$= 4750 \text{ pounds per square foot.}$$

We then draw the pressure diagram as indicated by making the base of the triangle equal to three times $H\ L$.

In this example we have chosen the graphical method of solution because it is quite appropriate, and because it gave us an opportunity of introducing the link and vector polygon construction. We could have proceeded as in the last example by calculating moments about a suitable point and dividing by the total weight to obtain the distance of the line of action of the total weight from that point, and we should have obtained the same result.

Slide Resistance.

In the case of a structure which is subjected to horizontal as well as vertical forces such as the present we have to consider the resistance of the structure as a whole to sliding, as well as the intensity of pressure on the soil.

The component of the resultant pressure on the base, which tends to cause sliding, is represented by the length $n\ m$, which scales 7,600 lbs. This is resisted by two forces, (*a*) the pressure of the soil on the front of the wall from the top of the soil to the bottom of the base, (*b*) the natural friction between the base of the wall and the soil. This natural friction varies with the soil, and for concrete or clay is usually taken at from 0.4 to 0.8 of the normal pressure, according to the wetness of the soil. The total resistance from these two causes should not be less than about twice the sliding component of the pressure; it is usual to assume, as we have done, that the earth pressure acts horizontally, but experiments show that it acts at an inclination to the horizontal which will reduce the slide component so that the usual assumption errs in practice on the safe side.

ACOUSTIC DEMANDS IN AUDITORIUM DESIGN.

On Tuesday last week, at University College, London, Mr. G. A. Sutherland delivered an address on "Acoustic Demands in Auditorium Design." Mr. J. A. Gotch, P.R.I.B.A., presided.

The lecturer said there was in some quarters a feeling of resentment that anyone claiming to understand the application of the principles of acoustics to architecture should not be able to take an existing example of a recognised architectural design, and by the alteration of a few unimportant details make it a pleasant place in which to hear and speak. But it was no more possible to adapt the laws of sound than it was to alter those of mechanics—acoustic considerations must influence the whole of a design from the outset. The conditions of good hearing in an auditorium were first, uniform and adequate loudness; second, distinctness or freedom from undue overlapping of successive sounds; and third, accurate rendering, or the preservation of their proper relative proportions in the simultaneous components of a complex sound. Uniform loudness was associated in practice with the absence of curved walls—all whispering galleries owed their peculiar properties of concentrating sound in one or more places to the presence of curved walls, and the concentrations were most marked if the surfaces were curved in two directions at once. Special concentrations of sound in some places implied corresponding deficiencies elsewhere; thus we had non-uniform distribution of intensity. Concentrations existed with sustained tones even in rooms with flat walls, but were unimportant unless the room had a large number of walls. The conventional rectangular pattern might always be safely adopted for all but the largest halls. There was no standard of loudness, but as a practical guide in designing a hall or chamber it might be taken that provision should be made that every auditor should receive in the first fifteenth of a second after the direct sound reached him, not less sound than he would receive directly if he were situated 50 ft. from the speaker. There was no scientific basis for the choice of a distance of 50 ft., but the reason why one-fifteenth of a second was chosen was that sounds which struck the ear at intervals of time less than that were not distinguished as separate, but might be considered as adding up to form the initial sound, whereas sounds arriving later had the nature either of an echo or a diffuse prolongation of the original sound.

Sound was a form of energy, and when sound waves were started they continued to be audible until converted into another form of energy. A mere breaking up of sound waves by irregularities in the walls of a room was of no service in this respect, but their entanglement in porous materials of every kind produced so much air friction that the sound was soon converted into heat. In the case of a speaker standing on a level plane the sound waves spread out from him roughly in ever-widening hemispheres, and the lower portion of these waves served anyone who might be on the plane. If that plane were covered with people standing, the sound was absorbed by the first few rows, and those at the back heard nothing. Placing the people on seats in tiers, and putting the speaker on a platform, made a larger portion of the wave serviceable, and matters were still further improved by placing a wall behind the speaker to reflect forward the back portion of the wave. This gave roughly the form of the classic theatre. If we added side walls, back wall, and ceiling we had the general form of the modern auditorium. But by these additions we completely altered the character of the problem. In the classic theatre there might, in certain parts, be insufficient loudness, for the wall behind the speaker was the only reflector helping to reinforce the direct sound; but there was no lack of distinctness due to overlapping of successive sounds, for the sound of each syllable, having passed over the audience, was lost at once. But in a modern auditorium sound might be buffeted from surface to surface for some time before it disappeared, causing a slow decay or reverberation instead of an immediate disappearance of the sound of each syllable. This was bound to involve indistinctness. Reverberation was the commonest defect in the audience hall of to-day. In designing such a hall distinctness was more important than loudness, but in the case of music some blending and overlapping of successive notes was desirable. Ideally, separate halls should be used for speech and music, and even for different classes of music, since the desirable reverberation periods differed in the different cases; but where a hall was to be used for all purposes a compromise must be made. In practice, it was found that a hall primarily adapted for speaking might be used with success for music, if there were a good deal of wood panelling in the neighbourhood of the orchestra.

The lecturer showed by diagrams how rooms of different shapes and sizes produced echoes and reverberations, and explained how it was that these were not so bad in the case of slow speakers as in the case of rapid ones. Echoes and reverberations, he said, could be reduced by the use of sound-absorbing materials in the building itself, or in its furnishing; and he gave a table showing the effect of different substances. The best absorbent was an open window, for through an open window sound entirely escaped; but a full audience was almost equally effective, and it was a matter of common experience that it was generally easier to hear in a room when full than in the same room when empty. The smallness of an audience could be in some degree made up for by having upholstered seats.

The table of sound absorption efficiency showed, among other things, that, taking the open window as 1.000, an audience as ordinarily seated was 0.960. Jute felt 6.6 cm. (about 2½ in.) thick was 0.770. A tile specially manufactured for lining auditoria was 0.382. Brick, plaster, and glass were examples of substances that reflected sound; in the case of a brick wall 18 in. thick, set in cement, and painted with two coats of oil, the sound absorption efficiency was only 0.017.

The lecturer acknowledged his indebtedness to W. C. Sabine and to Jaeger, and told how the former's first experiments had consisted in finding out how the reverberation period of a given room had been lessened by the introduction of a particular type of cushion; the absorption power of that cushion was determined by finding what area of it was required to produce the same effect on reverberation in the room as was produced by one square foot of open window. Once this particular type of cushion had been standardised, the absorption power of other materials was found by comparison with it, and a table drafted which enabled calculation to be made in advance of construction. This table also made it possible to specify the remedy for an unsatisfactory room already built, assuming excessive reverberation was the fault. The general principle to be followed was to have hard, sound-reflecting substances near the speaker, and sound-absorbing material in the neighbourhood of the audience; the reflecting surfaces being arranged to throw the sound to the absorbent ones in as short a time as possible. If any wall was curved that was an obvious place for absorbent material.

Of echoes, the lecturer said that besides reverberation and the unevenness of distribution produced by curved surfaces, echo was the commonest fault in large halls. If the difference in path between the sound arriving directly and that reflected from a hard surface was greater than 70 ft., the reflected sound arrived more than one-fifteenth of a second after the direct sound, and unless greatly enfeebled by absorption was heard as a distinct separate sound, *i.e.*, an echo. Long reflections of this sort usually included the back wall, which was, therefore, a suitable place for absorbent material.

The lecturer concluded with a reference to council chambers. In the case of these he said it was necessary to aim at exceptional loudness and distinctness. First, the hall should be so arranged that a speaker, by merely turning in his place could have an uninterrupted view of the ears of every member of his audience, including the visitors and press men. This ruled out the possibility of overhanging galleries with potential speakers far underneath them. Second, surfaces should be so arranged that for every member of the audience there was some early reflected beam of sound to supplement the direct sound. The ceiling was the natural place to use for this purpose; but if this was to be a reflector its height must not be more than thirty-five feet. Otherwise it would produce reverberation or echo. The upper parts of walls, including the back walls of galleries, should be of sound-absorbing material. This would leave the ceiling free to act as a reflector for direct sound, but there would be no sound thrown from wall to wall and coming back from the ceiling after a long interval. In the ideal council chamber the whole floor should be carpeted, and gangways covered with specially heavy carpets laid on under-mats. The seats should be made of the most absorbent type of upholstery. Galleries should also have upholstered seats, and when not in use might be cut off by heavy curtains. Seats should preferably be arranged in some sort of hollow square formation, and should be raised slightly as they proceeded towards the walls.

THE BUILDING TRADE.

INDUSTRIAL STATISTICS, 1923.

At the commencement of a new year we have usually considered the industrial statistics of the year that has passed, as they provide, when tabulated, a useful indication of economic conditions which have prevailed, and they contain some lessons which should be of future use.

Unemployment.

Unfortunately, perhaps the most dominant feature of 1923 was unemployment, and although the statistics show some decline, unemployment is like disease, the longer it continues the more serious it is for the patient, and no effort can be spared to combat it successfully. There is, however, nothing to be gained by ignoring any hopeful symptoms and in depressing the patient and, therefore, it is satisfactory to note that there is some reduction in unemployment as compared with twelve months ago.

It may be well in this connection to take the figures for two years, given in the *Labour Gazette* in respect of three classes, which we will table as under with the percentages of unemployed :—

	Insured workpeople.	Trade Unionists.	Workpeople registered at Exchanges.
December, 1921	16.2 ..	16.5 ..	1,886,000
December, 1922	12.6 ..	14.0 ..	1,408,000
December, 1923	10.7 ..	9.7 ..	1,174,000

Thus, in the two years, it will be seen that there has been a decline in the percentage of Insured workpeople unemployed of 5.5; of trade unionists, 6.6; and in the number of workpeople on the registers of the employment exchanges of 712,000, and thus matters are not at their worst, but as long as so large a number of workpeople are unemployed the problem of unemployment must continue to receive the most serious attention.

Trade Disputes.

In the two years mentioned above the difficulties attending employment were seriously increased by trade disputes, but in 1923 a marked improvement was shown in this respect, and we append a table for the three years 1921–3 :—

	Disputes.	Workpeople.	Working days lost.
1921	.. 763 ..	1,801,000..	85,872,000
1922	.. 576 ..	552,000..	19,850,000
1923	.. 611 ..	397,000..	10,642,000

It is earnestly to be hoped that when trade shows some revival it will not at once be checked in its progress by industrial disputes. In bad times the number of disputes is usually less, but immediately there are signs of revival, and before the effect is felt, industrial unrest revives also, at a time when strikes injure the workpeople and the community perhaps more than at any other period, for, as trade revives, contracts are placed here from abroad and those contracts can only be tendered for on the basis of existing conditions. If those conditions are changed by industrial disputes either the tender, if made, results in a loss, or contracts are cancelled under a strike clause, and as time is the essence of most contracts, contracts are placed in countries where industrial conditions are less disturbed, and the boom is lost and unemployment is increased. It has to be recognised that strikes and lockouts are like war, and should be the last thing resorted to and only in cases of dire necessity.

At no time can a lockout or strike be resorted to without a general set back in industry. The great coal strike came at the end of a period of better trade, and not at the beginning of a period of revival, but its effects were to precipitate the bad period and they may even still be felt. Conciliation in industrial disputes is the only way to prosperity, and a loyal observance of awards made with the concurrence of all parties concerned, or their representatives, must be inculcated.

A loss of even ten and a half million working days represents at the present rate of wages an immense sum in wages, somewhere about £6,000,000 at the least, and the purchasing power of those wages is lost, and indirectly affects the prosperity of the community. In the three years under review the loss in working days totals 116,364,000 working days, or between £58,000,000 and £60,000,000 in wages at a moderate estimate, and that at a time when foreign trade was practically non-existent and unemployment rife.

Wages and Cost of Living.

The three years under review were times of falling wages; the war had entirely upset the wages market, and the years 1919 and 1920 were years of increased rates of wages. The net result of changes in rates of wages is given in the *Labour Gazette* thus :—1919, increase £2,432,000; 1920, increase £4,797,000; 1921, decrease £6,026,500; 1922, decrease £4,211,000; 1923, decrease £309,400. The restoration of more normal conditions in the labour market is shown in connection with these figures, for in the years 1919 and 1920 the changes in rates of wages were all increases, no workpeople sustained a decrease. In 1921 some 80,000 workpeople experienced increased rates, but some 7,175,000 decreases. In 1922, 75,000 persons increases, but 7,633,000 decreases; but in 1923, 1,198,000 workpeople were affected by increases and 3,027,000 by decreases.

The cost of living figures for these years were as under, taking one month (December) in each year :—

1919	.. 125	per cent. above pre-war level.
1920	.. 169	„ „ „ „
1921	.. 99	„ „ „ „
1922	.. 80	„ „ „ „
1923	.. 77	„ „ „ „

Making allowance for the importance of the different industries, the *Labour Gazette* places the net reduction in ratio of wages in 1923 at about 3 per cent. of the ratios prevailing at the beginning of the year, and states that at the end of the year weekly full time ratio of wages averaged 65 to 70 per cent. above pre-war level.

It has to be remembered that the cost of living figures are based upon the actual standard prevailing in working-class families before the war: those were the days when fur coats and silk stockings were not included in the family budget, and we find a note in the *Labour Gazette* to the effect that, whereas in some families economies have been effected to meet the increase in prices, expecially where incomes have not been proportionately increased; on the other hand it is probable that in some families the standard of living has been raised where wages have been increased in greater proportion than prices. There can be little doubt that the whole nation, with the exception of those on very small fixed incomes, has so far failed to grasp the fact that, until trade is restored all the world over, there must be economy at home. Too much is being spent on luxuries and pleasure, and until international trade is revived the nations are really living on taking in their own washing, and unless more restraint is shown evil must result. The most urgent need of every nation is to restore its depleted capital, and until capital is restored and credit firmly established economy should be the watchword of the day. The money spent should be expended on reproductive work, or on works which will give some return by alleviating the burden of unemployment. Those bent on pleasure and luxury are fiddling while Rome is burning.

It may be noted that the average level of rents (including rates) of working-class dwellings is stated to have been about 50 per cent. above pre-war level at the beginning of the year, but to have fallen to about 47 per cent. by the close of the year owing to a decrease in rates.

Hours of Labour.

It is estimated that 334,000 workpeople had their normal working-hours increased in 1923 by an average of about one-third of an hour per week, whilst 9,500 had them reduced by an average of about 1½ hours per week.

The Building Trade.

In the Building Trade, 434,000 men were affected by alterations in rates of wages, the net result being a reduction of £67,900. In 1922, the figures were 518,000 workpeople and a net reduction of £392,000.

As regards hours of labour the effect of the arbitrator's award fixing hours in the summer season at 46½ and 44 hours at other seasons, unless the operatives agreed to work 44 hours all the year round, resulted in an increase of hours in December, as previously the hours generally worked in January and December in most districts had been 41½.

The year was marked by less disputes than the previous year, 54 as compared with 62, but more workpeople were affected—20,000 as against 8,000—with a loss of more working days, 384,000 as against 169,000.

LIVERPOOL HOUSING SCHEME.

Government Inquiry.

In his first report Mr. J. Orchard (Government Inspector of Audits) on the Garston Housing scheme of the Liverpool Corporation, stated that the Economic Building Corporation, which contracted to build 2,000 houses on the site but did not complete the contract, has received £330,000 in excess of what they were entitled to for the work they had done.

A second report has now been issued by Mr. Orchard, in which it is stated that the Company had less than £40,000 capital for carrying out the contract. Arrangements were made for payment of the contractors on an outlay basis, 90 per cent. on wages and materials, and 50 per cent. on plant, and the evidence went to show, states the report, that the City Council were greatly and continuously overcharged under both these heads, and that the contractors' claims were inefficiently checked and examined by the City Corporation officials. The evidence, it is stated, went to show that the contractor's managing director was guilty of extravagance and that he drew personally large sums of money from the amounts received from the City Council for financing the contract.

In his formal findings the Inspector states :—

"(1) The certificates presented to the City Council contain items the price or quantity of which was overstated, and having regard to the size and number of the discrepancies it is difficult to take the view that this was the result of accident.

"(2) The Council officials did not examine these details with reasonable care.

"(3) That the Housing Director and Architect, Mr. F. W. Badger, was not only negligent but grossly negligent in his examination of the statements put forward.

"(4) That Councillor H. A. Booth received moneys from the Economic Corporation."

The Special Committee of the City Council appointed to deal with the matter has also issued a report, in which it states it is satisfied that mistakes have been made, and that the circumstances disclosed a lack of capacity on the part of the Director of Housing to direct the administration of so large a contract, the magnitude of the work being too great to be efficiently performed by the staff. The Committee recommends that the Housing staff be transferred to the City Engineer's Department, and that the title of the Director of Housing be changed to that of Housing Officer, with a reduction in salary from £1,500 to £1,200 per annum.

MODERN BUILDERS' MACHINERY.

By STAFFORD RANSOME.

No. IV. ELECTRICAL AND STEAM POWER.—Part 2. (*Cont.*)

The Group Drive.

In spite of the many advantages of the individual drive, and because of its limitations which I have already outlined, the "group" drive (or more usually a combination of the group and the individual drives) is more popular in builders' mills. The group drive, as its name suggests, is the driving of two or more machines from a motor-driven countershaft which is common to them all. This method, although it does not eliminate all shafting and belting, reduces them to a comparatively small matter, and it has the advantage of reducing the "collective" amount of horse-power in the mill. This, of course, is on the assumption that the whole of the machines will not be used at their full capacity simultaneously. It is, therefore, eminently suitable for a builder's mill when the work of the individual machine is usually intermittent. Thus by grouping three or four machines under one fairly large motor, and arranging so that they are not all worked simultaneously, the horse-power of the motor may be considerably below the collective power of the motors which would be necessary if the same machines were driven separately.

A Comparison of Powers.

For instance, by grouping, say, a saw-bench, which would require individually as a maximum 15 h.p.; a hand-feed planer, 4 h.p.; a mortiser, 4 h.p.; and a tenoner, 8 h.p.—total 31 h.p.—they could be driven quite well by a single motor of, say, 25 h.p., provided that not more than two or three of them were to be worked simultaneously, as their average demand for power at any one time, plus the necessary shafting, would not exceed the capacity of the motor. In times of great pressure of work, however, when it may be desirable to work every machine at full capacity, the group drive may have a retarding effect on output unless each group has been somewhat overpowered for the normal requirements. The paramount advantage of the group drive lies in the fact that the countershaft may always be speeded to suit the motor, irrespective of the nature of the current, as the speeds of the spindles are regulated by the diameters of the pulleys on the countershaft and the machine. There is a further advantage in the group drive, and that is, that the relative efficiency of the larger motors is far higher than that of the smaller ones. Consequently, the single large motor used for a group is more efficient than a number of smaller ones. This last, though a point to be borne in mind, does not affect the user of wood-converting machines as much as it does those in some other industries where the requirements for power of the individual spindles are far lower than those of these tools.

In weighing the relative advantages of steam and electricity, we must not fail to grasp the fact that to attain the best work from wood-working machines the most perfect cyclic conditions are essential. "Cyclic regularity" is the constant running at a regular and even speed, without acceleration or retardation, of a shaft or spindle. In this respect the electrical drive is far ahead of the steam engine, and the nearest approach to the ideal in this connection is attained by an individual motor coupled to a spindle and impelled by an alternating current.

Cyclic Regularity.

Without going deeply into the theory of the question I can perhaps convey my meaning in popular form by saying that, in the first place, a reciprocating steam engine, which is propelled by the letting in of steam first at one end of the cylinder and then at the other, *i.e.*, by a series of shocks, can never give a perfect cyclic regularity. The evil is reduced by the fly-wheel, which absorbs those shocks to a certain extent, but in their reduced form they are imparted to the shafting, and are always there. The cyclic irregularity thus occasioned is increased by the torsional effect of driving on the shafting, and the longer the shaft the greater will be the cyclic irregularity. All cyclic irregularity in the main shaft is imparted faithfully through the belts to the countershafts, and from them to the spindles of the machines, increasing progressively and accentuated by the slipping or "ballooning" of the belts.

With an internal combustion engine, such as a gas engine, the evil is worse because it is driven by an explosion at only one end of the cylinder, and it "free-wheels" during the return portion of its stroke when it is impelled merely by the momentum of the fly-wheel. The electrical drive avoids the greater portion of these irregularities, first, because there is no reciprocating movement to be overcome or neutralised; and, second, because it eliminates most, or, in the case of the individual drive, all of the shafting and belting. Again, I would emphasise the fact that a plant driven by electricity cannot be worked if it is underpowered. Thus, if the motors are not sufficiently powerful, they have to be replaced, and, if you add more machines you have to provide more or larger motors to drive them. Thus the motive power increases proportionately and automatically with the increase in the plant.

Under-Powered Factories.

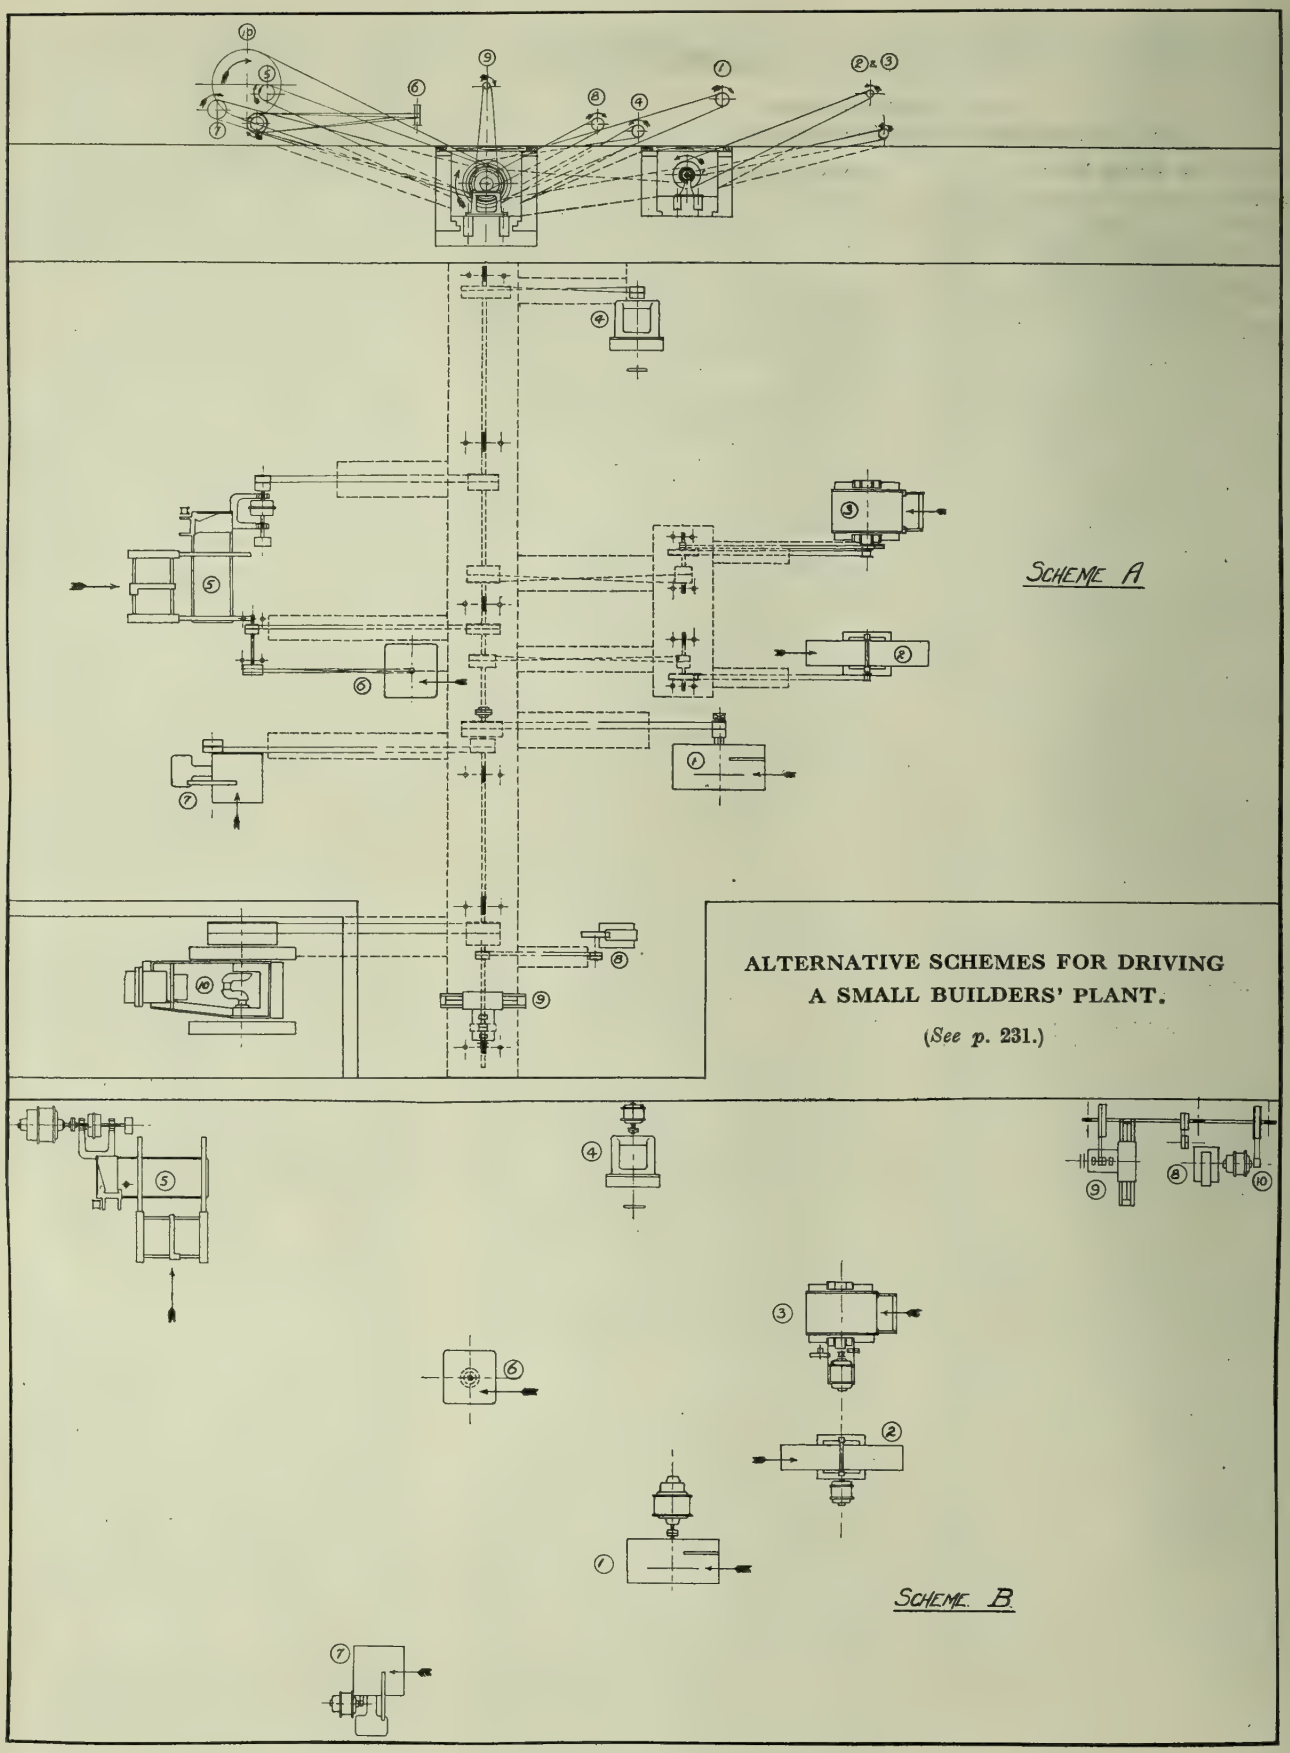
Such is not the case with a steam-driven plant, which, owing to the great capacity of the good old steam engine for negotiating overloads long beyond its proper economic limits, will go on turning the machines round somehow long after it has been grossly overtaxed. Builders' shops, which usually grow progressively from small beginnings, are often underpowered by the steady increase in the plant without increasing the steam power behind it. Many times I have been called in to find the causes of certain troubles in such factories where there was nothing wrong but an insufficiency of power. Such a condition may well be a cause of serious loss in efficiency long before it becomes very palpable to the superficial observer in a shop where it has come about gradually. But it should reveal itself in the quality of the work, due to excessive cyclic irregularity, and in the abnormal increase in the fuel consumption, due to the engine being taxed beyond its economical point. By the time that the evil begins to show itself in the slowing and racing of the engine, which is obvious to everybody, it has probably long been in a bad way.

Alternative Plans.

For the purpose of contrasting the collective and the individual drives I show, by the courtesy of a well-known firm of wood-working engineers of Halifax,* alternative sketches demonstrating two of their lay-outs of a small builder's plant. Scheme "A" shows a plant driven collectively by a gas engine, through shafting and belting, and Scheme "B" shows each machine, with the exception of the two small sharpening machines which have one motor between them, driven by its own separate motor, and all shafting dispensed with. The machines in each case are the same, and consist of:—(1) a 32 in. circular saw bench with rising and falling table, for ripping and cross-cutting; (2) a 15-in. hand-feed planer; (3) a 24-in. panel planer; (4) a chain and hollow chisel mortiser; (5) a tenoning machine; (6) a vertical spindle irregular moulding machine; (7) a 30-in. plain band-saw; (8) a saw-sharpening machine; (9) a straight and moulding iron grinder. Both installations are shown in a building of the same size, except that in Scheme "A" the engine has to be housed in an annexe to the machine-shop, and, for convenience sake, the sharpening machines are also placed in the annexe. A glance at the two shows at once the great saving of space by the adoption of the individual drive in plan "B," as not only are the countershafts and the belts (which are above the floor in plan "A") eliminated, but all excavation to accommodate the main and other shafts below the floor and their belting are avoided. The plant "A" could equally well be driven by a steam engine, but in that case an extension of the building to accommodate the steam boiler and fuel store would be necessary.

If an electrical motor were used to drive the whole of the machinery by shafting as in Scheme "A," the annexe would be avoided as the motor could be placed below the floor in the main building. Whether the motive power used for Scheme "A" is a steam or gas engine or a single large motor, 30 b.h.p. would be amply sufficient for the requirements of the plant working under normal conditions, because all the machines would not be demanding their full power requirements at the same moment. If, however, a larger or smaller motor is desired, it is a comparatively easy matter to change it without loss of time. Such would not be the case with either steam or gas power. We must bear in mind, however, that, whatever the class of motive power may be used for plant "A," it has to deal with a constant load equal to about 5 or 6 b.h.p. for driving the shafting and belting, without reckoning the power absorbed by the actual machines. This is saved altogether by the individual drive in plant "B." In plan "B" there are eight motors with a collective capacity of rather over 40 b.h.p. Each machine has its own motor except the two sharpening machines, which share one between them, *i.e.*, they are "grouped" for driving.

In the case of the circular saw, the hand-feed planer, the panel planer, and the vertical moulder, the motors are coupled direct to the spindles, thus avoiding all shafting and belting except that the feed of the panel planer is driven by a small belt from the spindle. The band-saw spindle is not coupled direct, because its speed is too slow for the motor, so the motor drives it through reduction gearing. Similarly the mortising and boring and the tenoning machines, each of which has more than one spindle, are driven each by a motor coupled to its countershaft which drives the various spindles by belting. In both cases, however, these machines are self-contained, and their countershafts form a part of the machines.



While the collective power required for plant "B" is considerably higher than that of plant "A," because each motor must be capable of driving its spindle to its full capacity for power consumption, the power absorbed by plant "B" for the amount of work done will, if anything, be less than that of plant "A." This is because, with the individual drive, the power is only used as and when required, and ceases entirely when a machine is out of work, whereas in plant "A" the main shafting and belts must go on absorbing power as long as any one of the machines is being used.

Except when the circular saw is being used for very deep cutting, it will seldom be found that the machines in plant "B" will be requiring more than 15 to 20 b.h.p. at any given moment.

There are also several minor but valuable advantages in the arrangement of the machines permitted by the individual drive, of which one may be mentioned. This is that in the general lay-out of a factory certain of the machines ought to work in parallel and others at right angles to each other to avoid turning the material.

Thus the ripping saws and the cross-cutting saws should be at right angles to each other, while all ripping saws should be parallel with each other. When driven from one shaft you cannot get a circular ripping saw and a circular cross-cut to work at right angles without the introduction of angle gearing, or an awkward arrangement of twist belting, both of

Key to the Machinery in Schemes "A" and "B."

SCHEME "A"—COLLECTIVE DRIVE, THROUGH TRANSMISSIONS.

1. Rising and Falling Table Saw Bench.
2. Hand Feed Planer.
3. Panel Planer and Thicknesser.
4. Chain and Hollow Chisel Mortiser.
5. Tenoning Machine.
6. Vertical Spindle Irregular Moulder.
7. Plain Band Saw.
8. Saw Sharpening Machine.
9. Planing and Moulding Iron Grinder.
10. 30 H.P. Gas Engine.

SCHEME "B"—INDIVIDUAL ELECTRICAL DRIVE.

1. As in Scheme "A," with 12 H.P. Direct-coupled Motor.
2. ,, ,, ,, with 3 H.P. Direct-coupled Motor.
3. ,, ,, ,, with 6 H.P. Direct-coupled Motor.
4. ,, ,, ,, with 3 H.P. Motor coupled to counter-shaft.
5. ,, ,, ,, with 7½ H.P. Motor coupled to counter-shaft.
6. ,, ,, ,, with 3 H.P. Direct-coupled Motor.
7. ,, ,, ,, with 3 H.P. Motor geared to saw pulley.
8. ,, ,, ,,
9. ,, ,, ,,
10. 3 H.P. Motor driving Items 8 and 9.

which are bad. A similar method must be employed if it is desired to get a circular and band-saw to work in parallel. With the individual drive, however, the proper relative positions may be attained without any complication. It will be seen that in Scheme "A" both the band-saw and the tenoning machine are fed at right angles to the rest of the plant. This necessitates the turning of the material. In Scheme "B," however, these two machines are turned so as to work in parallel with the others. Thus in Scheme "B," except that the ripping and cross-cutting happen to be done on the one saw-bench, the material throughout construction is never turned.

A Compromise.

In plans "A" and "B" I have shown the two extremes between the collective and individual drives. Between them, however, there is a compromise method which, up to the present, has been more usual than that shown by plan "B." This consists in grouping certain of the machines and driving others individually. A very ordinary method with the builders' plant illustrated would be to split up the driving of the machines as follows:—

Saw Bench	Separate Motor
Band Saw	Separate Motor
Hand Planer, Panel Planer, Moulding Machine	One Motor
Mortising Machine, Tenoning Machine	One Motor
Two Sharpening Machines	One Motor

This method naturally necessitates a certain amount of shafting, but it is still a great saving on that required by plant "A."

In the abstract one may say, "When available, use electricity from the point of view of good work, good conditions, simplicity, saving of space and labour, and usually of economy." Further, it is desirable to get as near to the individual drive as circumstances will permit.

When we come down to a concrete proposition, however, this view may be modified, and each case must be treated on its merits. The electrical current may be unsuitable or its price prohibitive; the builder may have premises fitted with steam or gas power which are already available; or it may be policy to use up his refuse for fuel; or, in the case of a temporary job, he may have a portable or some other engine which comes in conveniently for the purpose. And, of course, over and over again there will be no electrical power supply at hand. Then he must fall back on steam or gas, but at the present day he must first regard the electrical drive as the thing to adopt either for a single machine or a large factory, unless there is some valid reason against it.

Perhaps the most popular factor in favour of electricity from a power supply source, from the point of view of the small man, is that, by obviating the cost of a motive power installation, he is able to use more of his capital on the actual productive machinery. In any case it permits him to make a start as a user of machinery to the extent of a motor and a saw-bench, on a capital expenditure of £100 or even less, whereas with steam or gas he would have had to spend several times that amount on the motive power and accessories alone.

Carmarthen Bridge.

The Ministry of Transport has condemned Carmarthen bridge as unsafe. It is a massive stone structure with seven arches. They recommend the construction of a new one. The bridge was originally built by the Romans, and is of considerable historical interest. In 1233 Henry de Turberville broke down the bridge when he relieved the town, which was being besieged by Richard Marshall, Earl of Pembroke. In 1250 it was broken by pressure of ice, the river being frozen in spite of the tide. In 1326 a toll was raised for the renovation of Carmarthen bridge. It was twice widened before the seventeenth century.

HOUSING, &c., ACT, 1923.

WE take the following extracts from a circular issued by the Ministry of Health. (It can be obtained from H.M.S.O., price 1d. net.)

I am desired by H.M. Government to refer to the previous circulars issued in connection with the Housing Act, 1923, and to invite the special attention of the Council to the wide powers conferred upon local authorities of assisting persons to become the owners of their houses and builders to undertake the erection of houses by the grant of loans or by giving guarantees to building societies.

I observe with satisfaction that local authorities generally have been active in setting on foot under the recent Act schemes for the production of small houses by private enterprise with the help of subsidies. I am convinced that the work done in this direction, by assuring the revival of private enterprise in house building, will have far-reaching effect in re-establishing the supply of housing accommodation.

The Government, however, feel that up to the present full advantage has not been taken by local authorities of their powers of assisting the provision of houses by making advances to intending owner-occupiers or builders or by entering into arrangements for guaranteeing part of the advances of building societies. Although the total amount of loans sanctioned by me for the purpose of such advances is already considerably in excess of the total of all loans sanctioned under the Small Dwellings Acquisition Act, 1899, prior to the Act of 1923, the local authorities who have availed themselves of their powers in this respect are relatively few in number and many local authorities have limited themselves to the adoption of a scheme for the grant of subsidy.

May I urge upon all local authorities the importance of making the fullest possible use of these powers? There is, I am convinced, a desire on the part of many members of the working class to become the owners of their own houses, and as the facilities are in existence I should like to see them utilised to the utmost. The experience of those local authorities who have in the past made use of the powers of the Small Dwellings Acquisition Act has been uniformly satisfactory.

The adoption of simple and easily understood arrangements for the grant of loans to builders will also be of the greatest value in facilitating the rapid development of house production.

THE MANAGEMENT OF TOWN PROPERTY.

A LECTURE on "The Management of Town Property" was given at the College of Estate Management by Mr. Sydney A. Smith, F.S.I., F.A.I., recently.

The lecturer considered the position of an agent to whom the management of a large town estate was entrusted and said the agent must first make himself quite familiar with the extent of his authority, which ought to be clearly set out in the instrument creating the agency. He must then inspect the estate and get to know its details, checking the properties from the rent roll.

The lecturer detailed some of the points which would require attention and examination, such as rents receivable, assessments, tithe rent charge, land tax, betterment rate. Some provision in regard to rising rents and terminable outgoings must be made well ahead by means of card index, or other such system, otherwise changes of this nature were apt to be overlooked. Subsequently the agent would have to keep in touch with local affairs if the estate were away from his district.

The necessity of looking around and seeing what the neighbours were doing was important so that future developments might be foreseen, and in some cases leases granted only for such times as would not prevent alteration in the nature of the property when ripe for it.

The need for firmness in enforcing covenants, especially in regard to outside painting, of being acquainted with local by-laws and the building Acts, and of a definite policy in regard to licences authorising changes in the use of the property was also emphasised. It was also important in letting properties to get a reasonable form of lease, and when this was done not to vary it in any way.

THE COST OF BUILDING.

MR. H. J. TURNER, of Birmingham, writes as follows in connection with the article on "The Cost of Building," by Mr. T. P. Bennett, F.R.I.B.A., in our issue for January 11:—

"SIR,—In connection with *The Builder* Cost of Building Competition specific queries were sent to 30 builders, the first of which was: 'Did the issue of bills of quantities cause an increase in the tenders?' Six builders replied in the affirmative. In considering the important points which issue from such an interesting competition as this has been, one cannot help but pause at Clause 18 in the summary, where it is stated that bills of quantities tend to increase the tender of the small house. Perhaps some of the builders who replied to this effect would give us their reasons for so doing. In my opinion a bill of quantities should tend to decrease the cost of any buildings providing a specification is prepared to meet the circumstances of the situation, which, in this particular case, may have been cut down a little and made somewhat leaner. The architects, in compiling the specification, specified materials which were perhaps too high a standard, and which would involve too high a standard of workmanship for a dwelling of which a thrifty working man could be the happy possessor, and thus help to solve one of the nation's problems. I have followed the articles, and have gleaned much helpful information, but there seems much more yet to be done towards solving the economical use of materials and methods of construction. Had several of the important suggestions been made prior to the issue of the bill of quantities the tenders would have been lower and the quantities would, as they were intended, have proved a great asset to the competing builders."

Mr. Bennett replies as follows:—

"In my opinion quantities increase cost of the work in small contracts for housing, particularly in country districts, because:—

"(*a*) Labour and other items are so small that they are, in many cases, almost unpriceable if separately enumerated.

"(*b*) Small builders are not accustomed to quantities and are in the habit of pricing the larger items to include the smaller.

"(*c*) The issue of quantities suggests that great care and elaboration have been expended in preparing the work and that a corresponding high standard of finish will be demanded.

"(*d*) Quantities leave no latitude to the builder to use a method of finish or detail which may be familiar to him or which for other reasons is cheap to construct.

"(*e*) Very small working builders who are not familiar with quantities are nervous of them.

"The following is an extract from a letter from a London firm in answer to my query as to whether quantities tend to increase cost of building: 'Yes, chiefly because the quantities were taken out in a fully descriptive manner, all labours being taken out separately. This always adds considerably to the price per house, and in this instance, where the conditions of the competition stated that the prize would be awarded for the most properly-priced bill, the price came out at a much higher figure than I would have contracted for to build the house, also because labour-only items are usually covered by the builder when pricing houses in his bulk items, such as on the price per rod of brickwork, per foot cube for timber, &c.' Other builders stated that quantities tended to increase the cost, but gave no reasons."

LONDON DECORATORS AND PAINTERS.

THE London Branch of the National Federation of Master Decorators and the London Branch of National Painters' Society, as represented by the Local Joint Education Committee, held a special meeting at the Y.M.C.A., Tottenham Court-road on the 24th ult. The object of the meeting was to entertain the successful candidates in the 1923 National Competition, organised by the National Joint Education Committee. About sixty students from the various Technical Institutes were present, all of whom had been successful in winning prizes, diplomas, or certificates in the competition.

Those present included Mr. J. P. Williams (President of the London Association), Mr. T. S. Rowden (Vice-President), Messrs. Lott, B. Morris, F. Fry, H. G. White, and E. Deacon (the Treasurer); Messrs. F. A. Colborne, A. Alright, W. Barrett, P. Phillip (National Painters' Society, London Branch); Messrs. T. P. Bennett, C. H. Eaton, J. Dawson (Northern Polytechnic); and Messrs. A. Everitt, L. Drinkwater and Jorden (School of Building).

Mr. Williams pointed out that there was much talk of the craft of the painter having fallen into decay, and that there was an excellent field and opportunity for all those who really studied their craft to do all that they could by improving their standard of craftsmanship to raise the status of the craft, and thus make it one of which that those engaged in it would really be proud. He deplored the absence of a very active member of the operative panel on the Local Joint Education Committee, Mr. J. Joyce, the operatives' organiser for the London district, and spoke of his enthusiasm and energy in regard to the question of technical education.

Mr. F. A. Cobborne spoke on the improved opportunity in the craft to-day, as compared with years ago, reminding the boys there was then no organisation for the education of the painter, whereas now they had a good organisation financed equally by operatives and employers alike. There was, he said, no excuse for any person in the craft being inexperienced, because throughout the country they had technical schools with staffs of expert teachers whose duties were to impart the hitherto hidden secrets to those who wished to know them.

Mr. Everitt said Principal Sage, of the School of Building, much regretted not being able to be present. The work of the Joint Education Committee was very much appreciated in the schools. He thanked the Federation for providing such a valuable incentive for the students in their work in the numerous money prizes, diplomas and certificates, and urged the students to continue their studies year by year, and by so doing raise the standard of craftsmanship, that the deplorable shortage of skilled craftsmen might be made good.

Mr. T. P. Bennett (Head of the Architecture, Surveying and Building Department, Northern Polytechnic) likened the progress of the student to a man on a journey; there were many hills to be climbed, but from time to time there was much to encourage in the excellent scenery in the hills and valleys. The students had hills to climb, and to-night was one of the periods when they obtained a view of the excellent scenery, but they must not delude themselves and think that it was the end of the journey, but be refreshed and encouraged thereby, gaining strength that they might continue to the end and produce the perfect craftsman of which to-day there was such a serious shortage.

Mr. Cecil Campbell urged the students to continue. The trade, through inefficiency, had fallen into a serious rut, but he had every confidence in the ability of the British craftsman to get out of it. This could be done by carefully regulated and systematic study. He was pleased to see so many young people were studying their calling, and had no doubt that before long things, by their influence, would be greatly improved, and that the master decorator would have no need to wonder whence he could obtain suitably skilled workers when suggesting schemes of decoration which were something more than washes of plain colour and white enamel.

RATES OF WAGES IN THE BUILDING TRADE.

The following are the rates of wages in the building trade in England and Wales. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

	Masons.	Brick-layers.	C'p'ters. Joiners.	Plas-terers.	Slaters.	Plum-bers.	Painters.	Labourers.
Aberdare	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Accrington	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Altrincham	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Ashton-under-Lyne	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Barnsley	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Barrow-in-Furness	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Barry	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½

(For rates of wages in the Building Trade in Scotland, see page 243).

CONTRACTS, COMPETITIONS, &c.

For some contracts still open, but not included in this List, see previous issues. Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, &c., may be obtained.

BUILDING AND PAINTING.
